The Sixty-Second Annual Convention

Held at Detroit, Michigan, August 24-29, 1914

AMERICAN PHARMACEUTICAL ASSOCIATION

SIXTY-SECOND ANNUAL MEETING

DETROIT, MICHIGAN.

FIRST GENERAL SESSION.

The first general session was called to order Monday, August 19, at 3:20 p. m., by President George M. Beringer, of Camden, New Jersey, in the Convention Hall of the Hotel Pontchartrain, Detroit. The President called upon the Rev. Milton Lanyon Bennett, of Detroit, to invoke the Divine blessing upon the deliberations of the Convention.

The President then asked Vice-President Apple to take the chair while he presented his address, after which the President proceeded to deliver his address.

ADDRESS OF PRESIDENT BERINGER.

Friends and Fellow Members of the American Pharmaceutical Association:

For the third time, the American Pharmaceutical Association is convened in Detroit; the village of Cadillac that has now grown to be one of the most progressive of industrial centers and one of the world-renowned cities of the twentieth century. Detroit is noted for its commerce and manufactures, not the least of which are the drug products with which we are all more or less familiar. Likewise, is this city famous for its hospitality, and from the pre-convention reports we learn that the citizens have made great preparations for our entertainment during our present brief sojourn. Since we have been thrice cordially welcomed, we appre-

ciate that they have more than a neighborly interest in us. Doubtless we will, one and all, enjoy to the fullest their generous entertainment and carry home with us the most pleasant and enduring recollections of their overflowing goodfellowship and generous hospitality.

Custom and the By-Laws provide for an address by the President. I would gladly have availed myself of the latitude of the provisions of the By-Laws, and have addressed you on this occasion upon some erudite subject, but the immediate problems affecting the progress of pharmacy and the welfare of this Association are of paramount importance. Duty demands that personal inclination should yield to the necessities of the time, and so probably less congenial thoughts are presented for your consideration than was my original intent. I am aware that many of the subjects presented may have a familiar sound and that at times I may follow in the footsteps and repeat the advice of a predecessor. The very fact that such repetition is deemed necessary is my apology. I can only pray that my preachment may elicit your responsive interest so that such perennial presentations may be terminated.

I will request that each member of this Association and each friend of pharmacy, spare the time necessary to calmly and deliberately peruse this address when in print and further, that it be accepted as a personal appeal for each to assume a proper share in the responsibilities and problems confronting pharmacy. With the united, enthusiastic support of the membership of this Association every problem, whether commercial, educational or legislative, no matter how classified, can be rightly settled to the lasting benefit of all pharmacists.

Progress of the Year.—A year has elapsed since at Nashville you placed the responsibility of maintaining the integrity of our Association and of advancing its work upon a new executive. I assure you that wherever opportunity offered to further the interests of the Association, neither effort nor expense, so far as my ability permitted, has been spared.

I confess that the accomplishments of the year have not measured up to my expectation. Nevertheless, I am convinced that the Association has made some progress, the value of which must be determined in the future.

In matters pharmaceutic, the year has been one noteworthy for the progress made in the work of the revision of the United States Pharmacopœia and the National Formulary, and both of these revisions are now on the eve of going to press, and it is expected that before another meeting of this Association the publication of these legal standards will have been completed.

The War Cloud.—Trade conditions were likewise brightening until, suddenly, the horizon has become overcast with the appalling war cloud of a general European war. The immediate effect on the drug business has been a complete demoralization of the commerce in drugs and chemicals. Probably no other class of merchants are more dependent upon foreign producers and foreign markets than the druggists, and so the drug trade has more promptly and more extensively felt the interruption to normal trade conditions, the uncertainty of supplies and consequent skyrocketing of prices.

The aftermath is yet to come in that the destructive influences to peaceful callings that are coincident with or follow war, are yet to be experienced. Pharma-

cists are engaged in a peaceful avocation and are essentially peace loving, and we pray that the horrors of this war and of all wars may cease and that the world's progress in the arts, sciences, professions, manufacture, agriculture and commerce be no more disturbed thereby.

Fraternal Relations.—The American Pharmaceutical Association has always considered it to be a part of its mission to coöperate with any other organization for the betterment of pharmacy, the advance of the professions and the sciences or the welfare of society. It has exchanged fraternal delegates with many of the allied national societies. and with the various State Pharmaceutical Associations and our delegates to these organizations are uniformly received with marked courtesy and distinction. This is one of the very best means of keeping in touch with the work of other national and state societies whose work and problems are frequently those which likewise demand our attention. It broadens the influence of the A. Ph. A. and introduces our aims and work to the attention of others who would otherwise not become familiar therewith, and is still another avenue for increasing the membership of the Association.

The various Departments of the Government Service in recognition of the national, professional and scientific standing of our Association, have again accepted our invitation and appointed delegates, some of whom bring special messages of interest relating to our work. This pleasant reciprocity and fraternal coöperation should be encouraged and our programme arranged to provide ample time to receive their kind messages.

Our International Relation.—The American Pharmaceutical Association is respected by the foreign national pharmaceutical societies as the representative of the profession of pharmacy in the United States. Cordial fraternal greetings and best wishes for the year 1914 were exchanged between the officers of a number of these and your President. Our delegates to the Eleventh International Congress of Pharmacy, held at The Hague last September, no doubt, will present an interesting report on that convention.

The Association is in receipt of a communication from Dr. J. J. Hofman, General Secretary at The Hague of the Federation Internationale Pharmaceutique, inviting this Association to become an active member of the Federation. The importance of international agreements on many subjects directly associated with the practice of pharmacy is so well recognized that it is needless for me to present any argument thereon. It is very appropriate that in such an International Federation the American Pharmaceutical Association should become the representative of pharmacy in this country.

The financial obligation of such active membership depends upon the number of members we have. Membership would entitle the Association to representation in the Council of the Federation and to receive a number of its publications. I would urge that the Association express its endorsement of the objects of the International Pharmaceutical Conference, and that the Council be authorized to make application, at the appropriate time, for the active membership of the American Pharmaceutical Association.

Membership.—The membership of this Association is unique in that it admits all who are in any way associated with the various branches of pharmacy. Con-

sequently, its scope of work is broad and its opportunities for advancing the interest of every branch of the drug trade numerous. The retailer, the wholesaler, the manufacturer, the educator, the editor, the scientist, the tradesman, the proprietor and the clerk all have the same standing, and the Association is earnest in its efforts to serve the best interests of all. Despite the heterogeneous character of our membership we are a homogeneous body. The very composite nature of our membership gives us a more comprehensive view of the entire field of pharmacy, the needs and the progress in each line of work and permits the Association to wield an influence in coördinating such work to the material advantage of all.

Society is co-dependent, one nation upon another, one avocation upon another, one branch of a calling upon the other branches, and the greatest progress undoubtedly follows a coalition and coördination of their best efforts. Herein is the great opportunity of the American Pharmaceutical Association to serve the advancement of both professional and commercial pharmacy.

Pharmacy is a progressive calling requiring continuous study on the part of its followers to keep abreast of the ever-accumulating knowledge applicable to their work. The American Pharmaceutical Association through its meetings and publications is the great teacher of pharmacists. Its mission has been defined as that of the great post-graduate school of American pharmacy. It is ever earnest in its efforts to make better pharmacists, better business men, knowing that the advance of the individual is the advance of the profession. Its moral influence, its example, its leadership are factors that can not be measured by the money standards, but should inspire every druggist in the American continent to be a member.

There is nothing that would stimulate professional pharmacy more, nor be more beneficial to this Association, than the large membership that its efforts merit. During the year, a plan for a membership campaign along more comprehensive lines was inaugurated. This contemplated the presentation of the objects and aims of the Association and the advantages of membership to every druggist, chemist and pharmaceutical teacher and examiner. This plan was not offered as a sporadic effort for this year, but as a definite scheme to be tried out thoroughly by gradually extending each year the circle of its continued effort. Only by some such permanent plan for the guidance of the Membership Committee can we expect to secure the increase desired. In recent years, there has been a steady increase in our membership and this should be a record-making year. We have to date not more than ten percent of the eligibles enrolled in the Association. These figures should be reversed by continued effort until not more than ten percent remain outside the fold.

Local Branches:—Our Local Branches are additional centers from which the influence of the Association radiates, and which in return stimulate interest in the work of the Association and serve as recruiting stations for members.

During the year, two new Branches have been organized, one at San Francisco, the other at Columbus. Efforts have been made to induce the members living in other localities to organize Local Branches, but, so far, these efforts have not culminated in success. Additional Local Branches should be established in many of the larger communities in the United States, and we should likewise have

Branches in the Canadian Provinces and in Cuba and Porto Rico, and even in the Philippines.

In connection with Local Branches, I desire to make the following recommendations:

First, that the number of members necessary for the organization of a Local Branch be reduced from twenty-five to fifteen. This should encourage the formation of many additional Local Branches in centers outside of the larger cities.

Further, that the Chairman of the Committee on Local Branches shall provide for bulletins to be issued to the Local Branches suggesting topics of importance and general interest for discussion.

The Doing of First Things First.—If one reviews the history of the Association, he becomes impressed with the fact that certain questions that have been repeatedly presented to the Association are not yet recorded in our history as accomplished. Some of these problems date back ten or even twenty years or more. Some, like the question of tax-free alcohol for medicines, have in recent years been entirely neglected. Congress has found a way to grant tax-free alcohol for other manufactures, but not for the manufacture of medicines.

This lack of successful termination of many of these problems can be placed to several causes: the plan of our organization with only annual meetings and the continual changing of officers and their undefined authority; the lack of effective coördination of the work of the Association in the interim between meetings. With the changed conditions, with an active Council and a live Journal at our command, results should be achieved. Disjointed efforts are of little avail as the initial force is expended before the application of the new effort which is largely wasted in the recovery of lost ground.

Probably the principal cause is the failure to do the first things first. The late A. T. Stewart once declared to a large gathering of business men, that his success was due to insisting that first things be always done first and that each successive step be completed in its proper order. This rule is applicable to our work and it is just as essential for the success of the work of an association as for that of an individual.

The Pre-Requisite Laws.—The nation-wide adoption of a legal requirement that every pharmacist must be a graduate of a school of pharmacy before being licensed to practice, is the very first step essential for the professional elevation of pharmacy. It is not very creditable to American pharmacy that with its numerous schools of pharmacy, many of these of a high standing, that only six or seven States have yet enacted such pre-requisite laws. An anomalous situation exists in many of the States that are supporting universities with departments of pharmacy providing for a high type of students and then leaving the door to the practice of pharmacy, through its pharmacy boards, wide open for the registration of druggists without any collegiate education.

It is only too true that our Association has, from time to time, passed resolutions against such a condition. Resolutions are valueless unless it becomes the specific duty of some one to keep hammering away until they are driven home. A century of resolutions will be out-balanced by one year of activity.

It remains as an initial duty of this Association to see that this condition is

changed and changed promptly. The Sixty-Second Annual Convention should not adjourn until it is made the special duty of some committee or some officer to agitate in every State, where a pre-requisite law has not yet been enacted, for such an amendment to the pharmacy law. Such a committee should remain actively in the campaign until this blot on professional pharmacy in America, is entirely removed. When every State, or even a majority of the States, have adopted pre-requisite laws, it will be comparatively easy to make other desirable advances in the educational requirements of pharmacists.

The Extension of Pharmaceutical Education a Twentieth Century Need:—The great development of the past century has been general and practically along every line of human thought and application. With the development in the arts and sciences has come a corresponding enlightenment of the world. Ignorance is slowly but surely giving way to universal education. The tendency toward better education is common to all civilized nations and the citizens of our own country have been highly benefited by our public-school system. A high-school education is now the common privilege, and collegiate and university educations are annually fitting more of our young people to a higher plane of useful citizenship. A better elementary foundation and an extended higher education are the premises on which the greater success of a profession is predicated.

The trend of all modern professional training has necessarily been toward decided extensions of the educational courses. Law, medicine, dentistry, engineering, etc., have all responded to this evident necessity. In pharmacy, the advances in our own calling, as well as the advances in our sister profession and in the sciences on which our work is based, have multiplied many times the instruction to be imparted and to be acquired by the student before he can be properly equipped to satisfactorily perform his duties to the public. Honor and duty demand that we do not longer attempt to blindfold pharmacy to the necessity for extending the collegiate education of pharmacists.

The Pharmaceutical Syllabus.—The completion of the revised Pharmaceutical Syllabus has been one of the notable pharmaceutical events of the year. The book now presented shows material improvement over the first production under this title, and is well worthy of the critical study of each pharmaceutical teacher and examiner. Flattering reviews and laudatory reports, however, should not blind us to its shortcomings and defects.

This Association shares in the responsibility for this publication. Honor demands scrupulous honesty and permits no statement with the endorsement of the Association that we know to be incorrect, or that cannot be carried out.

There has been crowded into this volume "outlining a *minimum* course of instruction of twelve hundred hours" a wealth of instruction that cannot possibly be imparted by a conscientious faculty in the time specified, nor could it be properly acquired even by student prodigies. In pharmaceutical education, as elsewhere, prodigies are the exception and instruction must be based upon the ability of the average student to acquire knowledge. The teacher is too prone to measure the student by his own ability rather than by the student's. Students cannot be made uniform, they cannot all be cast in the same iron mold.

To allow each faculty or individual teacher to select what portions of the

"minimum" he will teach as coming within the possibilities of the time allotted, is very unfair to the student and places the responsibility of guessing aright thereon upon the examiner; an exceedingly dangerous precedent.

The idea of a pharmaceutical syllabus was first presented to this Association by Professor William Procter, Jr. It is to be regretted that the Association did not act upon the wise forethought of that illustrious educator. The appearance of the Ninth Revision of the U. S. P. and the new edition of the National Formulary will mark a new epoch in pharmacy and, no doubt, require a number of changes and additions in the teaching of pharmacy students. This would be a very appropriate time for the American Pharmaceutical Association to consider the preparation of a pharmaceutical syllabus expressive of the views of pharmaceutical educators and devoid of extraneous influences. I would recommend that this suggestion receives the careful consideration of the Council.

The Standardizing of Pharmaceutical Degrees:—From its organization, the American Pharmaceutical Association has rightly been the forum in which the problems associated with pharmaceutical education have been discussed. Not a few of these discussions have related to the subject of appropriate titles or degrees for pharmacists. When the first pharmacy school was established in this country, there was no precedent and this pioneer in the new field of education, adopted the ordinary scholastic title "Graduate." Considering the elementary condition of the pharmaceutical education of that period, and for some years thereafter, the academic degree of Graduate in Pharmacy was probably sufficient. With the development of pharmaceutical education and the claims of the educated pharmacist to professional rank, the appropriateness of such an academic title was seriously questioned.

Twenty-five years ago, it was commonly conceded that this title had outlived its usefulness and was unsuited for those who took up the improved courses of instruction in the better schools of pharmacy. The foremost thinkers and writers on the subject, advocated that the degree to be conferred upon the professionally educated pharmacists should be the doctorate degree the same as that conferred upon the practitioners of the other branches of medicine, so as to make parallel the degrees conferred in medicine, veterinary medicine, dentistry and pharmacy.

A number of the more prominent schools of pharmacy, then, adopted the Doctor of Pharmacy degree and have since conferred such diplomas upon their graduates. Many of the other schools, with less developed courses, or for some other reason, did not feel justified in following the example set by these leaders and, consequently, some retained the degree of Graduate and others sought new titles. As a result, we have a series of titles for pharmacy graduates given by the different institutions teaching pharmacy in the United States.

Unfortunately, heretofore, there has been no attempt made on the part of pharmacists themselves to properly standardize pharmaceutical degrees. The necessity for such action is now apparent. This is purely a pharmaceutical question, which can and should be settled by pharmacists themselves without undue influence from the outside.

In 1912, the New York Board of Regents, assuming that it had authority to promulgate regulations pertaining to the subject of degrees in pharmacy without

consulting with the schools of pharmacy outside of that State, issued regulations defining the conditions under which the various degrees in pharmacy should be conferred and made these new regulations regarding degrees a basis for the registration of schools of pharmacy by that State Board. This arbitrarily promulgated scheme of degrees, it is believed, covered all of the titles that had been conferred by the schools of pharmacy in America. Some of these degrees had been conferred, for many years by institutions outside of the State of New York, under entirely different conditions from those which were now prescribed. Moreover, very few of these degrees had been conferred by the schools within the State of New York. Thus the preëmption and prior use of these titles for many years, was entirely ignored.

The New York scheme of degrees is based upon an erroneous idea, that degrees in pharmacy must be in accordance with the degrees in the higher university courses. The peculiar position of pharmacy as an avocation combining professional education and practical business is lost sight of.

The New York scheme is subject to many criticisms. It proposes to perpetuate indefinitely the degree of Graduate in Pharmacy, a meaningless title for a professional practice, and likewise a two years' course as sufficient for the education of pharmacists.

The doctorate degree is only to be conferred upon the completion of six years of study in a school of pharmacy. It is apparent, that, under the present condition of society, such a degree would be only exceptionally conferred upon one actually engaged in the practice of pharmacy, yet its application to others than pharmacists, would be a misnomer. Thus would New York produce a pharmaceutical parody upon the Pinafore ruler of the Queen's Navy who never went to sea, in that her doctors of pharmacy will not be pharmacists.

The degree of Master of Pharmacy has been more frequently conferred in America, as an honorary degree upon those whose educational and professional standing and work in behalf of pharmacy has merited such distinction. For reasons not generally understood, New York would reduce this degree to rank below that of the Bachelor degree.

These criticisms indicate that the New York plan of degrees is far from perfect and that it cannot be accepted as a proper solution of the question of Pharmaceutical Degrees. Yet the endorsement thereof by the American Pharmaceutical Association has been covertly sought by insidious propositions presented to the Committee on Pharmaceutical Syllabus.

The most serious aspect of the situation, however, is due to the fact that the New York Board of Regents has made the acceptance of its decree regarding degrees, a prime requirement for registration of schools by the New York Board. Schools that had little to lose and hoped to gain much, promptly acquiesced and so those institutions which were subservient and complied with these pedagogic demands were promptly "registered." Those schools which have held out for their honor and for principle because they could not conscientiously approve of this scheme of degrees and would not agree to disrupt their well established plans of education and curriculum, have only been "accredited."

In that unique publication, known as Handbook No. 11, relating to Pharmacy, issued by the University of the State of New York, we have presented the anoma-

lous position, in which some of the schools of pharmacy which we all recognize as second or third rate schools, are registered in full and a number of our most prominent institutions, whose standing as leaders in pharmaceutical education is well recognized, are rated simply as "accredited."

A further exhibition of this arbitrary power is the ruling that the graduates of such recognized and prominent schools of pharmacy which are accredited, before being permitted to apply for examination to practice their profession in the State of New York, must take an additional year's instruction, possibly in one of the second class institutions registered by that Board. A graduate of a high class school of pharmacy with probably a three years' course of instruction of 2000 hours or more, may thus be asked to dishonor himself and his Alma Mater and belittle his profession by taking an extra year in a school with inferior equipment and in which the instruction amounts to not more than two years of 600 hours each. Thus New York promulgates as a new principle of its professional ethics, that the license to practice pharmacy in that State shall be based upon questionable regularity rather than upon thorough education and personal competency.

No less an authority than President Butler, of Columbia University, has declared that "the real measure of the efficiency of a university is the quality of the product it turns out." Yet this basic principle is ignored by the educational board of his own State.

The pioneer institution of pharmaceutical education in America whose work in behalf of pharmacy and its elevation has not been excelled anywhere, and whose graduates have been so highly honored by the American Pharmaceutical Association and which has given to American pharmacy such shining lights as Procter, Parrish, Ebert and Hallberg, not to mention those at the present time spared to us, is thus placed in the category of the dishonored institutions and its graduates forbidden to practice in the State of New York. Why? For the reason "that the recognition of its P. D. degree under other standards than that of New York would thereby have been involved."

This is not a fanciful picture, but an actual statement of the condition existing and of one of the most unwise exhibitions of power that any State Board could have made. It is so ridiculous that it is difficult to understand how those authorized to enforce a law with justice and equity, could be guilty of such a foolish outrage on pharmacy. It is a paradoxical exhibition of an honorable profession to be based upon the willingness of pharmacists to sell their honor and birth-right.

This is no longer a local question, but has become a national one fraught with grave possibilities of danger to the professional as well as the business interests of our calling. I would be derelict in my duty if I did not forcefully present it to you. One of the principles for which this Association has contended for years, has been that of the free interchange between the States of pharmaceutical license certificates. The action of New York is destructive of this principle and likewise interferes with the personal rights and liberty of the individual and with trade conditions which demand that a druggist shall have the right to employ competent help, educated either within or without his State. The pharmacists of America should condemn such an uncalled for exhibition of ultra-legislative power.

The decision that a pharmacist must be penalized and forbidden to practice in that State because he has chosen to exercise his right to select the school at which he shall obtain his education and degree is not in harmony with American ideas of personal or professional liberty. Such a status invites retaliation and an exhibition of state reprisals may be expected.

The conditions existing, demand that some national body shall prepare a comprehensive plan of standardizing the degrees to be conferred by the American Schools of Pharmacy. Such a national settlement of this question is essential to safeguard the interests of pharmacy and such a standardizing is probably the only way to arrive at a safe and definite scheme that would obtain nation-wide recognition. It is realized that this is a difficult problem to solve and calls for consideration by men of broad experience, practical knowledge, recognized probity and ability, who will judicially consider the subject and in their plan render a decision that shall be acceptable to all of the interests involved.

The American Pharmaceutical Association is the proper body to consider this subject and thereby render another signal service to pharmacy. One of its prime functions has always been, to inculcate correct theories of education. It has within its membership the proper *personnel* for such a committee. After giving to this matter earnest and careful consideration, I am constrained to recommend that the subject of the Standardizing of Pharmaceutical Degrees be referred to a Special Committee consisting of the President of the Association and the living former Presidents, with the request that this Committee give the subject prompt consideration with the hope that at the next meeting they may be able to present a report thereon.

Pharmaceutical Legislation:—Legislation continues to claim a large share of our attention. The drug trade is the target against which much unnecessary legislation is aimed. Well meaning enthusiasts, as well as fanatical agitators, consider themselves as especially commissioned to interfere with the duties and prerogatives of the pharmacist. They do not hesitate to question the honor of his calling, his integrity and the purity of his commodities, and even desire to prepare standards for his drugs.

The pharmacy laws, the anti-narcotic laws and the food and drugs laws are largely due to efforts of druggists themselves. The standards for drugs and medicines have likewise very largely resulted from their studies and investigations.

The Food and Drugs Act:—The drug trade, as a body, has been loyal in its support of the Food and Drugs Act. When the regulations for the enforcement of the Act of June 30, 1906, were framed, the representatives of the Government Departments sought the assistance of the drug interests and welcomed their advice in the framing of the regulations.

At great expense, labels were revised and reprinted to comply with the regulations then announced. In a few years, a new ruling was issued by the Department of Agriculture calling for a change in the wording of the Guaranty and again the loyal drug trade destroyed millions of labels and spent thousands of dollars in order to comply with these new regulations. The Department is now convinced that both of the Guaranty forms that it had directed to be imprinted on labels, were mistakes and have ordered that after a certain date their use be prohibited.

The vacillation of officials charged with the enactment of this law, is causing the drug trade serious annoyance and unnecessary waste of a large amount of money. A conference with the drug interests should have convinced the Department of the unjust position it was assuming in thus compelling merchants to destroy property and investments created through compliance with the Department's own ruling. Another complication arises from the fact that some of the States have passed Food and Drugs Acts closely copying the National Act and providing for the recognition on the labels of the guaranty statement of the National Food and Drugs Act.

The principles on which the food and drugs acts are founded are universally approved. The efficacy of these laws has been very largely in the educational and moral uplifting of trade conditions. The enforcement thereof should be on a high plane and free from any suspicion of unfairness. There should be no uncertainty as to the authority for the regulations promulgated or the legality thereof. Equally objectionable are prosecutions based upon trifling technicalities. In some respects the method of the enforcement of this law has been disappointing.

Postal Regulations Relating to Poisons:—The recent decision of the Post Office Department prohibits from the mails poisons. A regulation originally issued for the very proper purpose of excluding from the mail poisons of a volatile or corrosive or explosive character that would destroy other mail matter with which these might come in contact, has been extended in its meaning to preclude all forms of poisons. The handling of poisons is a necessary part of the druggists' service and his merchandise if properly protected by packing, and of a non-volatile and non-corrosive or non-explosive character should be admitted to the parcel post. Our Association should join the other trade associations in urging a modification of the postal regulations to permit of such shipment.

The Harrison Bill:—The measure providing for the control of the sale and distribution of narcotic habit-forming drugs, which in a very large measure, has been shaped by the Drug Trade Conference, has just passed the Senate. While some of the features and amendments may not meet with the unanimous approval of the drug trade, the object aimed at has had the hearty and continued support of this Association. The control by law of the sale of medicines, is admittedly a difficult problem, yet the better element of our calling have stood ready to subject themselves to no little annoyance, espionage and expense to aid in the accomplishment of this purpose.

The hope is expressed that a wise administration of the law may prove it to be entirely satisfactory to the drug trade and also a successful means of preventing the illicit trade in habit-forming drugs.

The Pharmacists in the Army Service:—Your Committee on Status of Pharmacists in the Government Service will, no doubt, present a report on their efforts to have the Hughes-Bacon Bill providing for a re-organization of the Army Hospital Corps, enacted at the present session of Congress. They deserve the thanks of the entire Association for their untiring efforts.

It has been my pleasure to keep in touch with the Committee and to coöperate with them to the limited extent possible. I am convinced that their continued

efforts have made a favorable impression and that there is a substantial foundation for the expectation that success will crown the efforts of the Association to obtain proper rank and remuneration for the pharmacists in the Army Hospital Corps.

The Chairman of the Committee on Military Affairs of the House, has written to me: "The bills which have heretofore been introduced for the purpose of this re-organization have had for their object the re-organization of the entire Corps and have assumed that the Corps is composed altogether of pharmacists. The Army Hospital Corps consists of thirty-five hundred men; comparatively few of these men are pharmacists and the bill for a general re-organization of this Corps does not at all reach what is desired for the pharmacists. The Hughes-Bacon Bill does not confer commissioned rank and that is what is desired I suppose. If commissioned rank is desired for the pharmacists of the Army a bill should be drawn with that purpose in view."

A recent issue of the Army and Navy Register, stated that it was proposed to grant to apothecaries in the Army Service commissions as second lieutenants. I do not know who inspired this article, but it is probably indicative of the idea advanced in the Department.

I would recommend that the Committee be instructed to prepare and introduce at the next session of Congress a new bill drafted in accordance with the suggestion of Chairman Hay and with all diligence work for its enactment.

The Bichloride Question:—The agitation in the public press over the subject of poisonings by Bichloride of Mercury Tablets, has served to direct attention to the possibility of additional protection to human life by restricting the shape of these tablets.

The suggestion made by Vice-President Apple, in a paper presented to the Pennsylvania Pharmaceutical Association, that Bichloride of Mercury Tablets be made in the shape of a coffin and with the word "Poison" stamped thereon, attracted more than usual attention, and has been favorably acted upon by a number of the manufacturers. Two manufacturers claimed to have a priority in the manufacture of these and have endeavored to secure patent rights thereon. In addition, Mr. Apple likewise claims a prior right and his publication seems to sustain this claim.

The interest of the public demands that if such a design is to serve the purpose for which it was proposed, that it should be free for use by all legitimate manufacturers and that the use of tablets of this shape be restricted to poison tablets. As a result of correspondence and interviews, the Norwich Pharmacal Company first proposed to prosecute its claims to completion and to assign to the Association all its claims and rights to the patent. Your officers fully explained that the Association could accept such a proposition solely in accordance with one of its declaration of principles, "the promotion of the public welfare" and not as a business proposition.

The effort to confine poison mercuric chloride tablets to a distinctive shape, not used for other medications or for foods or confections, is proving very acceptable to the manufacturers, a number of whom are already marketing the coffin shape tablet. Likewise is this shape of tablet rapidly gaining favor with

the medical profession and the drug trade. In this matter, the American Pharmaceutical Association has undoubtedly exercised its influence in the proper manner for the public good.

The A. Ph. A. Headquarters:—For several years, the proposition to establish a headquarters building has been talked of, but it has, so far been largely a matter of growing sentiment without taking definite shape. Before we can hope to make material advance on such a project, our sentiment must be replaced by well defined ideas as to the actual needs of the Association, the character of its past and future services to society, the scope of the work that it is desired to accomplish in the way of research and education, the value of such investigation to commercial interests and to the public welfare, the character and size of buildings and of grounds, the probable cost of establishing such a headquarters and the cost of its maintenance.

These are some of the questions that must first be decided and on which a few timely suggestions are offered. Our plans should contemplate ample room and facilities for carrying on the secretarial and clerical work necessitated by the activities of the Association and ample accommodations for the editorial staff of the Journal and other publications of the Association.

Well-equipped laboratories for research and study in which questions of scientific and of practical trade value, and of public health and sanitation can be systematically taken up and investigated. Many of the problems of the U. S. P. and N. F. revisions are in need of such careful study and investigation.

The formation of a Bureau of Education and Information, for the collection of data, valuable information as to drugs, such as source of supply, preparation, proper uses and dosage and to prepare and distribute to the trade reliable information on trade questions and to educate the press and the public to the proper duties of pharmacists and to give wider publicity to popular information relating to our calling and the public welfare. The Educational Bureau of the Paint and Varnish Manufacturers' Association of the United States is notably performing a similar service to those industries. The scientific investigation and the practical application should be closely allied.

A Museum must be provided for the collection, preservation and exhibition of drugs, adulterations, research results, etc., and likewise the historical data and archives that the Association is collecting.

A Library must be founded and supplied with the standard works, books of reference and current scientific and trade journals. There can be no research investigation without access to the literature.

Ground either attached to the buildings or accessible for experimental work in drug plant cultivation.

The buildings should be commodious, fire-proof and well ventilated. Ample funds should be guaranteed or, preferably, provided by endowment, to assure the successful carrying out of a comprehensive plan along the lines of these suggestions.

An Endowment for Pharmaceutical Research:—The preceding subject touches upon one of the great needs of American Pharmacy. In foreign countries, research in pharmacy is stimulated through government aid, endowments and

special funds provided for students under the guidance of national societies and universities. In the United States, we have been compelled to depend for such original research upon the individual efforts and encouragement of a few teachers or upon the work of the laboratories of the manufacturers. The vast field of possibility for systematic original research in pharmacy has, as yet, been only indifferently opened. Medicine has been generously endowed by the Rockefeller Endowment for Medical Research, but pharmacy is yet to be provided for. This is an age of bequests and endowments and we are not without hope that the equally important pharmaceutical research will be founded by some philanthropic person or persons.

Our Ex-Presidents:—Quite a goodly number of our former Presidents have been spared to us. Where health permits, they are usually in attendance at our annual meetings and their loyalty and interest in the affairs of the Association continues throughout life. No man has yet been honored with the high office of President of this Association who has not concentrated his thought toward the betterment of the Association. The duties of the office have given him opportunities for observation and obtaining knowledge of men and affairs relating to pharmacy. The question has arisen, what are we doing to profit the Association by their special knowledge and ability? What shall we do with our Ex-Presidents?

I would advise that they be constituted as an Advisory Council to which certain questions calling for wise consideration and mature judgment may be referred by the Association or the Council.

The Committee on Publication:—The Committee on Publication will present a detailed report of its work for the year and in connection therewith, I desire to submit a few additional comments:

The Year-Book of the A. Ph. A. for 1912 was issued in June, 1914, and contains the usual excellent abstracts for which the Report on the Progress of Pharmacy under the editorship of Professor C. Lewis Diehl has been noted. The delay in its issuance, however, has created considerable comment. It is to be regretted that the Year-Book of the Association cannot be completed and published within a reasonable time after the expiration of the year which it commemorates. The immediate publication of the Year-Book for 1913 should be directed. My attention has been directed to the absence of the Code of Ethics in our publications. It is very appropriate that this be published annually in the Year-Book.

The Committee on Publication have been confronted this year with unusual difficulties. The illness of our Secretary and Editor compelled him to present his resignation, which was the most serious misfortune that could have possibly overtaken our Association. Every member of this Association appreciates the earnestness, the fidelity, the sincerity and ability exhibited by Dr. James H. Beal in the discharge of his official positions and the success of our Journal must largely be attributed to his indefatigable efforts. The Association should express in no uncertain terms its high appreciation of the services rendered by Secretary and Editor Beal.

I believe that the time has come when the A. Ph. A. must arrange for the work

of its Committee on Publication to be carried on under a more comprehensive business plan than has yet been attempted. The Committee should be given considerable more latitude than other Committees because of the character of the work assigned to it and the business problems it has to contend with. During the year, it has been necessary, at times, for the Acting Secretary to advance large sums of money to prepay postage, the expenses of the distribution of the Year-Book, for clerical assistance, etc., etc. The Association should not place the burden of carrying its finances upon any individual.

I would recommend that the Committee on Publication be given more extended powers. That it be authorized to organize an effective editorial staff and clerical force to satisfactorily carry on the work of the publication office.

That the appropriation for the use of the Committee be paid to the Committee in quarterly sums in advance. That the Committee be authorized to select one of its members as treasurer who shall disburse its funds on vouchers approved by the contracting official and countersigned by the Chairman. That the accounts of the Committee be subject to the approval of the Auditing Committee of the Association and of the Council.

National Formulary.—We are justified in our expectation that the National Formulary will be issued before our next meeting, and the Committee on Publication should have ample authority to contract for its publication and sale.

With the appearance of the new edition of the National Formulary, the first prepared as a legal standard, its importance will be greatly increased and the sale should be very extensive and the Association should reap a substantial profit.

An organized effort should be made to make it a more popular book and to acquaint the physicians as well as the drug trade in general with its character, importance and usefulness.

I would recommend that the Committee on National Formulary be instructed to appoint a specialist or else a sub-committee to prepare an epitome to be used in advertising and popularizing the work, and that subject to the approval of the Committee on Publication and the Council, an edition sufficient for these purposes be published.

Also that either an independent committee or a sub-committee of the Committee on National Formulary be appointed as a Committee on Propaganda, whose duty it shall be to acquaint the physicians with the character of the N. F. preparations, to prepare literature for distribution through our members and the drug trade in general, explaining the formulas, uses and dosage of a selected list of the more desirable preparations. Such a system of advertising the book should add very materially to its usefulness and considered solely from an advertising standpoint the Association should be amply reimbursed for the expenditures.

Association Reforms.—The discussions in the pharmaceutical journals and in the Council during the past year on the necessity of reforming the methods of transacting the business at our annual meetings and for co-ordinating the work of the Sections, are welcome evidences of the interest of the members in the internal affairs of the Association.

Some observations and suggestions are offered with the hope that they may aid

in improving the procedures of the Association. We must bear in mind that in recent years the scope of the activities of the A. Ph. A. has been greatly broadened and new avenues of usefulness to pharmacy and to the public are continually opening up to us. No line of useful activity should be discontinued until the work is accomplished.

The composite character of our membership requires equal service to many interests. What is of primary importance to one class of members is only of secondary interest to others. Our duty is plainly to serve and to protect all pharmaceutical energies and interests and to co-ordinate these to the advancement of the entire calling. The success of one line of work is a progressive influence to all.

The A. Ph. A. has a distinct field of work and this calls rather for the outlining of a distinct method of procedure and not the copying too closely of the methods and plans of procedure adopted by other national societies.

The proposition to eliminate from our meetings the customary addresses of welcome and responses is contrary to the procedure of most national organizations and deprives the Association of the public recognition that it deserves and that is usually appreciated by both the visitors and the host.

There are those who propose to eliminate from our annual programme all of the entertainment features. This is the only vacation that many of our members take and, in the attendance at our meetings, they seek a relaxation from the strain of their usual occupations. The elimination of the usual entertainments and social functions would make our meetings exceedingly dry to these fellow members and we would lose their interest and attendance and the Association would undoubtedly suffer materially from such a procedure. These entertainments are a means of getting pharmacists closer together, of encouraging good fellowship, and firmly cementing the bonds of friendship. Prof. Procter rightly declared that one of the needs for the organization of the A. Ph. A. was "that such an association is calculated to enlist the feeling of brotherhood."

The great trouble at our annual meetings is the attempt to crowd entirely too much business into the time allotted. The orderly presentation of the business of the Association and its proper consideration require time and the time must sooner or later be given, even if the meetings have to be lengthened. There are many problems regarding the general welfare of the Association which must be discussed in general session; yet we have curtailed the work of the general sessions by eliminating therefrom everything possible. As a consequence, there has been crowded out of the general sessions the consideration of many problems which should be decided therein. As an example, the report of such an important committee as the Committee on Revision of the Constitution and By-Laws, which must be considered in general session because it proposes amendments, has remained an unfinished order of business for two years because there was no time at the Nashville meeting for its just consideration. Some of our problems could have been solved if time had been given to the proper consideration of this important report.

I fear that in many ways our By-Laws go entirely too much into details. To legislate many years in advance for the number of general sessions and for the

number of Sections and their meetings, results in fixed and rigid programmes. More flexibility and variability is desirable to permit, from time to time, of the introduction of new and interesting features. The assignment of time to each Section should be made annually in accordance with the actual needs of the Section for that year. At present, the By-Laws fix the number of sessions for each Section. The Chairman solicits a sufficient number of papers to fill the entire time allotted and thus quantity and not quality becomes the gauge of his success.

The Committee on Programme should have the authority to arrange such details in accordance with existing conditions and requirements.

The Duties of the President:—The By-Law relating to the duties of the president, would seem to indicate that his main duty was to preside at the general sessions and to present an address. I have assumed that this was not the intent and that his function was also to keep in close touch with all of the various activities of the Association.

The power of appointing committees should be vested in either the President of the Association or in its Council. The system of the promiscuous appointment of committees should be discontinued. Committees recommended by the Sections should, upon approval, be appointed by either the President or the Council.

On March 26th, Mr. Gus Lindvall, who had been elected at Nashville, Chairman of the Commercial Section, asked to be relieved of that chairmanship as he contemplated going abroad and on April 9th presented his resignation. Your president was somewhat uncertain as to his right to accept the resignation or to appoint a successor as our by-laws do not provide for the filling of such vacancies. The matter was very happily adjusted by Mr. Harry B. Mason consenting to accept the position and the success of this Section's meetings was thereby assured. There should be no uncertainty as to the authority of your officers and the by-laws should clearly provide for the filling of all vacancies.

The Committee on Nominations:—The success of an organization depends very largely upon the character and ability of its officers and no more important duty is left to a committee than the selection of nominees for the executive officers. Calm, deliberate consideration of the needs of the Association and the fitness of the candidates for the duties of the office should take the place of the hasty and inconsiderate action that at times has marked the meeting of the Committee on Nominations. This Committee appointed at the first session, is required by the By-Laws to report at the second session. Consequently, its meeting is usually after the first general session and, if the hour is late and other appointments are scheduled shortly thereafter, its work is expedited in an unseemly rush and at times with many of the members of the committee absent. Since our elections are now held by mail, some weeks after the meeting, the report could be made at a later meeting and thus more time given to perform this important duty.

The Installation of Officers:—In most organizations, the installation of officers is considered as an important function and is attended by more or less ceremony. It is recalled that President L. C. Hopp recommended that a general session be held on the evening preceding the last day of our annual meeting for the special purpose of installing the officers. In recent years, the importance of this feature

has been minimized. The induction into office occurs at the close of the last general session and, not infrequently, in the presence of an exceedingly small audience and the new president assumes his duties with a strange feeling of vagueness and uncertainty. The iconoclast has now appeared and would destroy even the small vestige of ceremony remaining. I can not conceive that the success of the Association is going to be enhanced by such utilitarianism.

The Council:—The intent of the creation of the Council was to have a compact body to take charge of the business of the Association so that this could be promptly dispatched. As a result of amendments to the original idea, the Council is becoming too large and unwieldy and so the object of its creation, promptness of action, is being defeated. We annually elect three new members at large so that representation is assured and the communications and acts of the Council are published in the Journal and are subject to the approval of the Association. Further, the right to comment on the published proceedings and to attend the meetings of the Council, is open to any member. The custom of permitting each Local Branch to elect a member of the Council should be discontinued and I recommend that the By-Laws be so amended.

House of Delegates:—The idea associated with the creation of this House was that it was to provide for the reception of delegates and for the discussion of general topics which they might introduce. Also, that it might be developed into a sort of general governing body bearing the same relation to the Council that the House of Representatives bears to the Senate. The desirability of retaining such an organization where delegates may meet and discuss common problems is dependent entirely upon the development of a need therefor.

The suggestion that the reception of delegates be by the House of Delegates is untenable and might be construed as discourteous. The delegates bring the greetings of their societies to the American Pharmaceutical Association and not to other delegates.

It must also be recognized as contrary to accepted parliamentary proceedings to refer to a body composed of delegates, many of whom are not members of the A. Ph. A. or especially interested in its internal affairs, the consideration of resolutions relating to the policies and affairs of this Association.

I suggest that the function of the House of Delegates be restricted to the consideration of topics of general interest to the societies that they represent and that a place on the annual programme be reserved for a meeting of these delegates where they may discuss such appropriate subjects.

Committee on Resolutions:—The Association does need and should have its own Committee on Resolutions. I propose that such a Committee be appointed at each annual meeting to consist of ten members, five appointed by the President and five by the Chairman of the Council. To this Committee shall be referred by either the Association or the Council, resolutions and motions. The Committee shall hold open sessions for the discussion of matters submitted to them and learning the views of members thereon. This would materially save the time of the general sessions and of the Council.

The Women's Section:—The Women's Section was organized, by resolutions adopted at the Denver meeting, to fill a want and the interest and enthusiasm of

our lady members since this Section was formed, indicates that it is going to be a potent factor in popularizing the Association, increasing its membership and extending its usefulness. There is no necessity to have all of the Sections of the Association working along the same lines. The Women's Section has a distinct field of its own for work in behalf of the Association. Its status should now be determined. I strongly urge that it be continued and established as a permanent Section of the Association.

This raises a question, however, as to what class of membership should be provided for the ladies who are not actively engaged in the drug business and who are not active members of the Association. We cannot expect the wife or daughter of an active member to also become an active member and to contribute the full annual dues. Neither can we consider that the membership of the Association covers the ladies of a member's family nor that members of the Women's Section shall be exempt from membership in the Association and the payment of any dues. It has been suggested that we create a class of members to be known as Auxiliary Members, to which shall be eligible the women members of the families of our active members and other women engaged in pursuits associated with pharmacy and that a nominal dues only be fixed for such members. I heartily approve of such a recommendation.

The Sections:—The number of Sections should not unnecessarily be increased. By a systematic classification and re-arrangement of the other Sections, the present work can be continued and a place found for the proposed new Sections.

I would recommend that the Section on Scientific Papers be renamed the Scientific Section; that its work be divided into sub-committees: (a) Chemistry; (b) Botany and Pharmacognosy; (c) Biologic Assays; (d) Bacteriology; and that the chairman of these sub-committees be named as the associates of the Chairman of the Section to co-operate with him in securing papers and arranging the programme.

I would recommend that the Sections on Practical Pharmacy and Dispensing and on Commercial Interests be combined under one title, the Section on Practice of Pharmacy, and that its work be divided into sub-committees; (a) Commercial Interests and Methods; (b) Operative Pharmacy and Dispensing; (c) Pharmacopœias and Formularies; and that the chairmen of the sub-committees be named as the associates of the Chairman of the Section to co-operate with him in securing papers and the preparation of the programme.

The Section on Pharmaceutical Legislation and Education should be continued with two sub-committees; (a) Legislation, and (b) Education, with the chairmen of the sub-committees as associates of the Chairman of the Section to co-operate with him in securing papers and the preparation of the programme.

The Section on Historical Pharmacy should likewise be continued.

Affiliated Associations:—It is very desirable that the various pharmaceutical bodies, whose work is more or less associated with the work of the A. Ph. A. and whose membership is largely composed of members of our Association, should hold their meetings at the same place and about the same time as our own annual conventions. Their meetings, however, should be arranged so as not to conflict with the meetings of our Association or its Sections. I will suggest

that, wherever possible, such affiliated Associations should hold their meetings either just in advance or immediately after the meetings of this Association so as not to interfere with our business.

I am aware, that in the presentation of this address, I have departed, in some respects, from the conventional lines.

It has appeared to me, that the best interests of pharmacy and of this Association would be served by following the dictate of duty rather than that of tradition. Forgive me for having tried your patience and wearied you by such a lengthy address and I will promise never again to repeat it.

I desire to record my grateful acknowledgment for the uniform courtesy, support and co-operation that has been so generously given by the Treasurer and the Secretary and by each officer and member with whom I have corresponded or seen in person.

In conclusion, permit me to express my appreciation and sincere thanks for the honor that you have bestowed upon me, the highest honor in the gift of American pharmacy, the Presidency of the American Pharmaceutical Association. As your presiding officer, I beseech your kind consideration and indulgence during this convention week.

During the reading of his address the President said:

"I want to depart just a little from my text to say a word to these pharmacists of Michigan who are gathered together with us in this Convention during the present week. Michigan has forged ahead this year with a large increase in membership. I believe that every member of the Michigan Pharmaceutical Association should likewise be a member of the American Pharmaceutical Association. Would it not be a glowing example, an inspiration to the entire country, if the Michigan Pharmaceutical Association were to set an example this year of being the first Association to affiliate with the American Pharmaceutical Association, in its entirety? I leave this thought with you, members of the Michigan Association. I believe that a year's trial will convince you that the moderate cost of a few dollars a year will not measure the benefits that each and every one of you will receive from a year's membership and perusal of its publications."

Vice-President Apple then said: "Members of the American Pharmaceutical Association; you have heard the very able, comprehensive and valuable address of the President, which contains a number of recommendations which you must make some provision for when you dispose of this address. What is your pleasure in this matter?"

Dr. F. E. Stewart then moved that the Vice-President appoint a committee of five to consider the President's address; motion seconded.

Mr. Harry B. Mason, of Detroit, then moved an amendment that the portion of the address beginning with the sub-head "The Reforms of the Organization," or some similar title, be referred, not to this committee of five, but to the Council. Mr. Mason explained that at a meeting of the Council, held in the morning, it was made a special order of business on Tuesday evening at 9 o'clock to discuss and decide definitely certain questions of internal reform embodied in the recommendations of the President. Mr. Mason felt that it would be an in-

justice to the President if the address were left entirely to this committee of five, because the committee appointed by the Chair would not report until Saturday morning at the last general session, to be ultimately acted upon. He offered the amendment out of courtesy to Mr. Beringer. Amendment seconded and carried.

The motion as amended was then put to a vote and carried.

Vice-President Apple then appointed as a Committee to consider the President's address, the following members:

Joseph P. Remington, Philadelphia;
Otto Raubenheimer, Brooklyn;
Joseph L. Lemberger, Lebanon, Pa.;
Robert H. Walker, Gonzales, Texas.
Thomas F. Main, New York.

[Mr. Main declined to serve and the vacancy was not filled.]

The President then resumed the Chair. The President then read a cablegram from the Cuban Pharmaceutical Association.

Havana, August 23, 1914.

George M. Beringer, Hotel Pontchartrain, Detroit:—

Cuban Pharmaceutical Association sends its greetings to the members of the American Pharmaceutical Association, and appoints as delegates Messrs. Gerardo Fernandez Abreu and F. Herrera.
E. C. BELLO, President.

The President, on behalf of the American Pharmaceutical Association, extended its greeting to the Cuban representatives.

Senor Gerardo F. Abreu, of Havana, then addressed the Association, in Spanish, as follows:—

Ladies and Gentlemen:

The Cuban National Pharmaceutical Association, of which I have the honor to be President, on accepting the kind invitation sent by you, conferred upon us, the honor of representing it, in this act of professional solidarity and scientific work which you hold annually.

And on accepting this duty in deference to the fulfillment of this mission, I must acknowledge the unwisdom of the Cuban institution in nominating me as one of its delegates, even more so when my lack of familiarity with the English language prevents me from transmitting to you, in a language understood by all, the message of greeting and sympathy which the Cuban pharmacists send to you through us.

We are well aware of the distinction conferred on our association in inviting us to this national convention; a distinction which you have bestowed on our nation—a nation which, although small in geographical extent, is great in its desire for progress and scientific culture—for although of distinct origin, the Cuban people and the North American people are united by old and intimate ties of affection.

From those lands, in fact, came to us the splendor of your free institutions which awoke in us the desires for liberty and progress. In American soil the Cuban patriots found in the days of our heroic struggles for independence, fond affection which gave them strength to continue it. It was in North American

soil that the greatest of our poets found inspiration for the greatest of his conceptions, the beautiful ode, which the magnificent spectacle of Niagara Falls suggested to him. It was in North American soil where that great apostle of our independence—Jose Marti—preached the sacred creed of our rights for liberty. And last of all, it was in American soil and by American legislative bodies, where it was proclaimed to the world the right of our country to be independent, defending this right with money and blood, blood which, spilled in our fields, has like sacred seed germinated and brought forth as its fruit a great and undying love and affection.

And this development of political and social sympathies in the existence of these two countries, could not but reflect itself in the professional lives, and it is for this reason that we are here in this national convention, feeling as if we were at home.

We feel sure that this Association works for the same ideals which ours do, which are those of exaltation and progress, to be accomplished solely by noble and scientific means, thus deserving the esteem and approval of the public, for which reason we feel satisfied in being associated in attaining the same aims. And on these grounds in which we feel ourselves united, we would suggest to you, since you are powerful enough to initiate it, to try to establish a Pan-American Pharmacy with the same course of studies and one and the same ideals in the whole continent.

To accomplish this, the first stone has been already laid in the translation into Spanish of the American Pharmacopoeia, translation made by a Cuban of merits, very learned and kind and who should have been Cuba's worthy representative in this Convention, Dr. José Guillermo Diaz.

I have abused, ladies and gentlemen, your kindness, and allow me, therefore, to beg your pardon for having done so; and after expressing my most sincere thanks to the members of the Director's Committee in Dr. Herrera's name and in mine as well for the many kindnesses which we have received, may I express in the name of the National Cuban Pharmaceutical Association, my most sincere wishes for the enlargement and progress of your Association, that it may be able to carry out its purposes, and may the United States continue the wonderful development of its scientific and industrial progress.

The Secretary then announced that at a meeting held at 2 o'clock by the Chairmen and Vice-Chairmen of the various sections of the Association, it was unanimously decided to call all sessions promptly to order on scheduled time, and to have 9:30 mean 9:30, and 2 o'clock to mean 2 o'clock, and that every Chairman agreed to start his section work on the stroke of the clock, regardless of how many people were in the room; and also that it was generally decided that no speaker should be given more than five minutes in extemporaneous discussion; that no speaker should be permitted to talk twice on the same question until everybody else had been heard from who desired to express himself, and that papers whose authors were not in the room when called upon in regular order should be put automatically at the end of the section program, and that the Chairmen appealed to the Association at large to coöperate with them in this movement and to be prompt in their attendance.

This statement of the Secretary was greeted with applause.

President Beringer next read a communication from the British Pharmaceutical Conference.

British Pharmaceutical Conference, 17 Bloomsbury Square,
London, W. C., August 6, 1914.

Dear Sir:—I am directed by the President, Mr. E. Saville Peck, to acknowledge with thanks the invitation to attend the meeting of the American Pharmaceutical Association, and to say that we regret we are unable to send a delegate this year.

We trust that your meeting will be a great success and that your deliberations will add materially to our common stock of pharmaceutical knowledge.

Yours faithfully,

H. FINNEMORE, Honorable Secretary.

George M. Beringer, Esq.

This communication was received with applause.

The Chair then read a communication from the Pharmaceutical Society of Ireland.

The Pharmaceutical Society of Ireland.
67 Lower Mount St., Dublin, August 6, 1914

My Dear Sir:—I am directed by the President to cordially thank you for your kind invitation to appoint a delegate to attend the forthcoming meeting of the American Pharmaceutical Association, and to explain that, as our monthly Council falls on the 11th instant, it does not seem possible to avail of your kindness on this occasion; in any case, I expect the state of war existing would interfere with a delegate proceeding.

Wishing your meeting every success, I remain, my dear sir,

Yours fraternally,

ARTHUR J. FERRALL, Registrar.

Mr. George M. Beringer, American Pharmaceutical Association, 501 Federal Street, Camden, N. J., U. S. A.

The Chair next read a communication from E. M. Holmes, Esq.

Ruthven, Sevenoaks, Kent, August 4, 1914.

G. M. Beringer, Esq.:—

Dear Sir:—I wish to thank you and the officers of the American Pharmaceutical Association for your kind invitation to the annual meeting on August 24th. I only wish it were possible for me to do so and to meet so many American pharmacists whom I have not yet had the pleasure of seeing. Professor Remington, Professor Rusby, Mr. Squibb and some other of your pharmacists of world-wide fame, and some of your leading botanists,—Professor Asa Gray, Professor Farlow, Professor Greene, etc., I have had the pleasure of seeing and conversing with in this country, but there are so many others who, I am sure, like Professor Uri Lloyd, could teach me and show me much if I could only manage to cross the barriers that hinder one. When your invitation was received neither you nor I anticipated that European war would commence this year. I fear the crush to obtain passage to America will hinder many from attending the meeting this year. None the less I hope it may prove a very successful meeting so far as American pharmacists and excellent papers are concerned. I am looking forward to the pleasure of perusing the report when published. I am, dear sir,

Yours faithfully,

E. M. HOLMES.

The Chairman then asked the Secretary to read communications from the various departments of the Federal Government and requested that the delegates

mentioned in the communications come forward and present the wishes of their respective departments to the Association.

The Secretary then read a communication from W. C. Braisted, Surgeon General U. S. Navy.

Washington, D. C., July 15, 1914.

Dear Sir:—I have to acknowledge your letter of July 6th, in which you ask that a duly appointed delegate be nominated for the forthcoming meeting of the American Pharmaceutical Association, to be held at Detroit, Michigan, August 24th to 29th.

In reply, I would say that this Bureau nominated Passed Assistant Surgeon Willard G. Steadman, Jr., U. S. Navy, Navy Recruiting Station, Detroit, Michigan, for this duty, and orders were issued to him by the Navy Department on July 14, 1914.

I would therefore suggest that you communicate with him at your earliest convenience and inform him of the place in Detroit where the meeting will be held.

Very respectfully,

W. C. BRAISTED,
Surgeon General, U. S. Navy.

Mr. George M. Beringer, President, American Pharmaceutical Association, 501 Federal Street, Camden, N. J.

The President asked if Mr. William G. Stedman was present. No response being received, the Secretary proceeded to read a communication from D. F. Houston appointing Dr. Hoover as a representative of the Bureau of Chemistry, Department of Agriculture.

July 11, 1914.

Mr. George M. Beringer, President, American Pharmaceutical Association,
Camden, N. J.:—

Dear Sir:—Replying to your kind invitation of July 7th to appoint a delegate from this Department to attend the meeting of the American Pharmaceutical Association at Detroit, Mich., August 24th to 29th, I beg to state that I have designated Dr. George W. Hoover, of the Bureau of Chemistry, to represent this Department.

Respectfully,

D. F. HOUSTON, Secretary.

After the reading of the communication, Doctor Hoover addressed the Convention as follows:

“Mr. Chairman, Friends and Members of the American Pharmaceutical Association:—I wish to say I am very glad of the opportunity of being with you at this meeting in the capacity of representing the Department of Agriculture. I wish to say that the Bureau of Chemistry, with which I am connected, of the Department of Agriculture, feels very grateful for the assistance which this Association has extended to the Bureau in its work. I was particularly interested in the remarks that our President made, especially as they refer to the enforcement of the Food and Drugs Act. It has been my lot to have been associated with the work in connection with the enforcement of the Food and Drugs Act, especially as it refers to the enforcement of that part of the law which applies to drugs.

“I am very glad to be here, especially in view of the impression that our President’s remarks created in my mind. He referred especially to the discontinuance of the serial number and guarantee legend causing great hardship

among the trade, and to the attention of officials to technicalities. I am perfectly satisfied that our President is very sincere in the remarks that he made, but I am frank to confess that I believe he is mistaken in some particulars. I wish to explain that portion in which, to my mind, he is mistaken. I have been connected with the Department since the passage of the Food and Drugs Act, and I am going to tell you of a few things to which the Department has given the greatest attention in the enforcement of the law, and I am going to leave the matter to you gentlemen to decide whether or not the Department is unjust, and whether it has devoted its time to technicalities. The Department has devoted its time to the examination of imported drugs and interstate drugs, and especially with regard to crude drugs and secret medicines that are brought into this country, devoting its time, for illustration, to testing belladonna root obtained from poke root up to eighty percent, and products sold as saffron, which were entirely spurious; products that are represented to cure tuberculosis, diphtheria, cancer, diabetes, Bright's disease, etc., products which would be virtually worthless for these ailments,—these products being interstate products. It has devoted its time to the examination of the same class of products which I have just mentioned that are represented to the subject as cures for cancer, diphtheria, typhoid fever, and other infectious diseases. It has devoted its time to the examination of tablets that are represented to contain a certain percentage of ingredients, for example, nitro-glycerin, 1/100 of a grain found to be deficient from a hundred percent down,—some containing no nitro-glycerin at all. I am only citing that as an example. The Bureau has spent a great deal of time in the examination of preparations of cocaine, morphine, codeine, heroin, cannabis indica, chloroform, ether, etc., represented to be harmless, and some of them represented to produce natural sleep, which we all know is not true. That is the class of products that this Department has been working upon in the main.

We have devoted considerable time, probably, to technicalities. It seems necessary and it is not by choice. We would rather not refer to technicalities at all. In so far as this guarantee legend is concerned, it has been unfortunate all the way through. I am in full sympathy with our President's remarks with regard to the guarantee legend, and it appears now it was a mistake from the start in the regulation. The department has tried to correct that feature by amending the regulations but has failed, and the annoyance that that has given the manufacturers of drugs and dealers in drugs, and manufacturers of food products has been tremendous. It has cost a tremendous amount of money, for all of which we are very sorry. Of course, that does not remedy the difficulty; but, after the mistake was made it appears there was nothing else to do except to eliminate it and get it off our hands as soon as possible. I am sure that the Department regrets very much the inconvenience and expense that that feature has entailed. I am very glad to have had this opportunity to address these few words to the Association." (Applause.)

Secretary Marshall then read a letter from the Surgeon General appointing M. I. Wilbert and G. A. Morris as representatives to the Convention, as follows:

Washington, D. C., August 11, 1914.

Dr. George M. Beringer, President, American Pharmaceutical Association, 501 Federal Street, Camden, N. J.:—

Dear Sir:—Referring further to your letter of the 6th ultimo, I desire to state that Technical Assistant M. I. Wilbert of the Hygienic Laboratory of this Service, and Pharmacist G. A. Morris have been detailed to represent the Service at the meeting to be held by your Association at Detroit, Mich., August 24-29, 1914.

Very truly yours,

RUPERT BLUE, Surgeon General.

Mr. M. I. Wilbert, of Washington, D. C., then addressed the Association as follows:

“Mr. Chairmen, and Members of the American Pharmaceutical Association:—It gives me great pleasure indeed, to be able to present to you the felicitations of the Surgeon General of the Public Health Service, and I am sure I am correct in assuring you of his hearty coöperation in any feature of your work that pertains to the progress of furthering of public health, and on the other hand, to request of you, your coöperation in that feature of the public health work that relates more specifically to your calling. The efforts that have been and are being made in connection with the various organizations or parts of the organizations of public health work are of interest to you, and I am sure are of material benefit to some of you in the progress of your business, and are of direct benefit to all of you in your every-day affairs.

I thank you again for the opportunity of being here, and trust that you will peruse the work being done by the service and exercise your own judgment in giving such coöperation as you may be able to do.” (Applause.)

The Chair then called upon Mr. Morris, the other representative of the Department. Mr. G. A. Morris responded to the Chair's request and said that he had no specific instructions from the Surgeon General of the Service relative to the meeting, and that his colleague, Mr. Wilbert, had covered the ground thoroughly and for that reason he did not desire to take up any further time except to say that he was very pleased to be present and meet with the Association.

The Secretary then read correspondence had with the Department of Commerce, as follows:

Washington, D. C., July 17, 1914.

Dear Sir:—In reply to yours of July 7th, suggesting that representatives of this Department, and especially of the Bureau of Standards, be delegated to represent the Department at the meeting of your Association in Detroit on August 24th to 29th, I have to state that it will give me great pleasure to name one or more delegates to represent the Department at your Conference.

The representative from the Bureau of Standards will probably be Mr. Louis A. Fischer, and a suggestion from you as to what subject you would like to have him discuss will be appreciated. I will also be glad to receive any further suggestions from you in regard to this matter. Respectfully,

WILLIAM A. REDFIELD, Secretary.

Mr. George M. Beringer, American Pharmaceutical Association, No. 501 Federal Street, Camden, New Jersey.

Washington, D. C., August 11, 1914.

Sir:—In reply to your letter of July 22d, in regard to sending a delegate to represent the Department of Commerce at the meeting of the American Pharma-

ceutical Association at Detroit, August 24th to 29th, I have to say that the Department will be represented by Mr. L. A. Fischer of the Bureau of Standards, who will be prepared to suggest subjects in which the Bureau might coöperate with the Pharmaceutical Association either at present or in the future.

Among such are:

1. The adoption of the present international atomic weights based upon oxygen as 16, instead of those based upon hydrogen as 1. Such a change would involve a revision of many of the tables of the Pharmacopœia and the U. S. Dispensatory.
2. Methods for the standardization and use of solutions for volumetric analysis.
3. The possibility of improving the purity of chemicals, especially those used in analytical work and bearing analytical labels.
4. The adoption of standard tables such as those showing the relation between specific gravity and percentages of alcohol, and tables showing the relation between specific gravity and degrees of the Baumé scale.
5. The adoption of a standard temperature or temperatures at which volumetric apparatus, and hydrometers shall be standard.

Several other lines of the work of the Bureau might also be of interest to the members of your Association, but the above are sufficient to illustrate the nature of the questions our representative will briefly discuss.

It is suggested that some one from the Department of Agriculture would be best qualified to give information respecting the source of drugs, and the methods of collecting, curing, and marketing them. Respectfully,

E. F. SWEET, Acting Secretary

American Pharmaceutical Association, No. 501 Federal Street, Camden, New Jersey.

In connection therewith the Secretary read the following telegram:

Washington, D. C., Aug. 19, 1914.

Geo. M. Beringer, 501 Federal Street, Camden, N. J.:—

Please change name of delegate to represent Bureau of Standards from L. A. Fischer to Dr. F. A. Wolff. E. B. ROSA.

Dr. Wolff, who was appointed by the Secretary of Commerce to attend the Convention, was not present at the time the above correspondence was read, and the Chair stated that it was to be hoped that Dr. Wolff would be present at another session to present the greetings of the Department.

The President then asked the Secretary to read a communication from the Secretary of War, in which the Secretary of War explained why he was unable to send a representative to the Convention. The letter is as follows:

Washington, D. C., August 5, 1914.

My Dear Sir:—Upon the receipt of your letter of July 24th, suggesting that this Department appoint delegates to attend the meeting of the American Pharmaceutical Association to be held in Detroit, August 24th to 29th, I took the matter up with the Surgeon-General of the Army and find the situation to be as follows:

In the appropriation act passed by Congress, and approved on June 26, 1912, there was a provision forbidding the expenditure of any of the money appropriated therein for, among other things, the attendance of officers of the government at any meeting or convention of any society or association, unless there was a specific authorization for such expenditure. There is no such specific authorization under which we could pay the expenses of any of our officers while attending your Convention. There is, therefore, no way in which we could send delegates, unless the officers saw fit to make the expenditure out of their own pockets.

From the above, I think you will realize the difficulty we have to face in this connection.

Sincerely yours,

LINDLEY M. GARRISON, Secretary of War.

Dr. George M. Beringer, President, American Pharmaceutical Association, 501 Federal Street, Camden, New Jersey.

The Secretary then read the following communication, signed by N. H. Martin:

Ravenswood, Low Fell, Gateshead, August 13, 1914.

American Pharmaceutical Association, via Frank G. Ryan, Esq.

My Dear Mr. Ryan:—The near approach of the meeting of the A. Ph. A. in Detroit brings back so vividly the memory of my former enjoyable and profitable visits to your city that I feel that I must write to you personally and express my great regret that it is not possible to come to the meeting, a regret which is shared by my daughter, who was with me in 1905, and who would much like to come to the meeting and again renew her acquaintance with your fine city and its beautiful surroundings, as well as to meet again many of the friends whose acquaintance she made at Atlantic City.

From the program which has been published in the Journal you are sure to have one of the most, if not the most, successful meeting in the history of the Association. That is saying a great deal. I have the Journal of the Association complete since 1874 and the odd volume for 1859, so I have had an opportunity of keeping very much in touch with all the work of the Association and know its value to pharmacy.

My daughter joins me in very kind regards to you and tells me to say she retains a very happy recollection of the enjoyable time you and your wife and daughter gave her in 1905. Yours always sincerely,

(Signed) N. H. MARTIN.

The Chair then called for the delegation of the American Medical Association. Prof. William A. Puckner responded and addressed the Convention as follows:

"Mr. President of the Association, Ladies and Gentlemen:—I beg to acknowledge that I am not a delegate from the American Medical Association. Unfortunately, their Association is organized entirely along business lines. Its business is carried on by a House of Delegates, and this House has not authorized the appointment of delegates. It has been customary, however, for this Association to send a delegate to its section on Pharmacology and for this Section to send its delegate to you, and the Chairman of the Section on Pharmacology has asked me to present the greetings of the Section. First, I should say that the American Medical Association conducts its scientific program through various sections, and the section which takes up pharmaceutical matters, the action of medicines, is the so-called section on Therapeutics and Pharmacology.

On behalf of this section, and I may safely say on behalf of the entire medical profession, there is a growing need of high-class pharmacists, and the medical profession recognizes that pharmacy is striving to fill this demand. Wherever I go I hear about, from physicians in medical colleges, the recognition that the pharmacist is striving for higher things, and that this striving is thoroughly appreciated by the medical profession. Much has been said in pharmaceutical circles about drug nihilism. The medical profession, as a profession, does not recognize it. It is striving toward the intelligent use of drugs and striving with its best effort, and if anybody tells you that the medical profession is working for the abandonment of drugs, it is not true.

At this time it seems to me that the medical and pharmaceutical professions should take steps to coöperate more closely in certain directions, and I have in mind at the present time the revision of our patent laws, which medicine feels,

though pharmacy feels it still more. I think the present scarcity of drugs is bringing home to the people of the United States the need of a revision of our patent and trademark laws, and I hope that this Association will take some step toward securing a reform in these matters. I am sure that if you will take the first step, and the medical profession feels that you are better fitted to take up this work than they are,—if you will take the first step, I am sure you will receive the heartiest support from the medical profession of the country. I thank you.” (Applause.)

The Chair then called for delegates from the National Wholesale Druggists’ Association. Dr. William J. Schieffelin responded as follows:

“Mr. Chairman, Ladies and Gentlemen:—I am very proud to be here to-day as a delegate of the National Wholesale Druggists’ Association, and to convey their greetings and best wishes for the success of this Convention. We have long realized the importance of the work of this Association; we have long revered the leaders of this Association as the men who have not only set a standard in pharmaceutical science, but who have made it a business to be proud of, rather than to be ashamed of; a business of dealing in drugs and chemicals. When we remember Maisch, Prescott and Squibb, and when we see that work that has been done constantly for over sixty years by this Association, an association that was founded in order to combat the adulteration of drugs and to defend the health of the people of the country, we simply must say ‘God speed’ to this great organization, and we say that we are glad that the organization exists, and we are glad that it is developing along such progressive and such sane lines as have been outlined to-day in the able address of the President. It seems to me, if I may speak personally, that I have seldom, if ever, heard a more comprehensive, and a more intelligent address given by any presiding officer, even if it did take a long time; it was worth staying to hear it. (Great applause.)

It is too bad that the greetings given by the other delegates were not subject to,—I won’t say question, and I won’t even say debate, but to discussion. It would have interested me very much to have had a discussion on the remarks made by the first representative from the Bureau of Chemistry of the Department of Agriculture, and also to have had Doctor Puckner tell us in regard to the direction in which he wanted us to step relative to the patent laws. We would be glad to do it if we only knew, but the time is getting late and it is not exactly proper now to raise this question. In conclusion, I want to say that I am glad to be here and express the lively interest and sympathy which the wholesalers have for your great Association.” (Applause.)

The Chair then asked if there were any delegates present from the National Association of Pharmaceutical Manufacturers. Mr. C. M. Woodruff responded and said:

“Mr. Chairman, Ladies and Gentlemen:—Mr. Lovis of New York, President of the National Association of Pharmaceutical Products, has appointed Doctor A. R. L. Dohme of the well-known firm of Sharp & Dohme, Mr. Merck, of Merck & Company, and myself, as delegates to the House of Delegates, to represent our Association. I am disappointed to receive a communication from Dr. Dohme this morning advising me of his inability to be present, for I had expected he would extend the best wishes of our Association on this occasion.

Mr. President, we congratulate you upon your meeting, and upon the magnificent and thorough address you have delivered to your Association to-day. It is all that Doctor Schieffelin said of it and a little more. There are many questions that you alluded to that are close to the hearts of the manufacturers, but time will not permit me to speak of them now.

The question of the reform in patent legislation is very vital at the present moment, and if we only had the law that Canada has, and that most of the European countries have, we would not only have a revenue to save us the necessity of perhaps a stamp tax, but we would also be able either to make the synthetics in this country for which we have to depend upon Germany now, or they would have to make them here themselves. Under the patent laws in Canada we have reason to know, if you import into Canada a patented article after a certain period, you lose your rights under the patent. That is wisely devised to insure the manufacturer in Canada of the article for which you impose a tax, and within a certain time you must manufacture in Canada or lose your patent. And that is true with respect to the patent laws in some of the European countries, notably France. If we had such a law here it would not be long before we would be making these synthetic products with respect to which there is going to be a famine pretty soon.

But, sir, I will not prolong my remarks. We are going to be with you in the House of Delegates to do what service we can to promote the interests of this Association. Mr. Main claimed very rightfully at one of our meetings that the American Pharmaceutical Association was really the parent of the National Association of Medicinal Products and we want to do honor to our parent." (Applause.)

The Chair then called for the representative of the National Association of Retail Druggists. Mr. Mann addressed the Convention as follows:

"Mr. Chairman and members of the American Pharmaceutical Association:—Unfortunately I lost my voice at the meeting of the National Association of Retail Druggists last week and I know that I cannot make myself very audible, but I am very greatly pleased indeed to be able to appear before you at this time to extend the greetings of the National Association of Retail Druggists. So many of our members are members of the American Pharmaceutical Association that it would seem almost that the two organizations ought to be one great united brotherhood. In fact, all of the problems of the National Association of Retail Druggists are problems of the American Pharmaceutical Association, and in order that the two great organizations may work out the best salvation for all concerned, there can only be one way that the two organizations should travel, and that must be in union. I think in the main we have been successful in traveling along the same lines of endeavor. While it is only natural that occasionally individuals of the two organizations may have slight differences, I think the organizations constituted as a whole, do not have any differences, and that we really are working as one great brotherhood.

The meeting of the National Association of Retail Druggists held in Philadelphia last week was a most harmonious one. I do not believe there ever was a time when the work of that body was expedited with less friction than it was at that time, and I believe that in the matter of legislation, the two bodies are really

commencing to get a little closer together, and that it will not be long before we really will have some narcotic legislation that seems to be the fitting thing for all of us.

The President then stated that there were a number of organizations that had not as yet been heard from. One was the American Association of Pharmacal Chemists, a new organization. President Beringer said that the President of the organization, Mr. George C. Hall, had appointed as a delegate Mr. E. N. Webb, of the Columbus Pharmacal Company. The Chair called for Mr. Webb, but Mr. Webb was not at that moment in the room. President Beringer also called for Mr. Ralph R. Patch of the E. L. Patch Company; Mr. Jacob Wein-kauff, of the Sutcliff & Case Co., Peoria; the delegate from the Proprietary Association of America, none of whom were at that time in the room.

The Secretary then read the following telegrams:

Baltimore, Md., Aug. 22, 1914.

Mr. Geo. M. Beringer, Hotel Pontchartrain, Detroit, Mich.

Dear Mr. President:—Unfortunately I cannot attend the meeting of our time-honored Association this month, but this will not prevent me from sending cordial fraternal greetings through you to those assembled in Detroit during the coming week. I shall be with you in spirit although absent in flesh for the first time since 1891. Kindest regards and best wishes for a pleasant and successful meeting to all the officers and members present, especially my good old friend, Prof. Diehl.

Sincerely,

CHAS. CASPARI, JR.

San Francisco, Calif., Aug. 23, 1914.

Secretary American Pharmaceutical Association, Hotel Pontchartrain, Detroit.

May the 62d convention of the American Pharmaceutical Association be dominated by the spirit of human progress toward which the science and art of pharmacy has contributed much. May it not be unduly influenced by trade interests which detract from the dignity of the organization and the status of pharmacy as a profession; may it recognize the physician and the pharmacist as co-workers, each entitled to the other's respect, both striving for the common good. I regret my inability to take part in the proceedings. We shall meet, I hope, in San Francisco in 1915.

FRED I. LACKENBACH.

The Chair then called for the report of the Committee on Drug Reform, L. E. Sayre, Chairman. Mr. Sayre stated that, as has been the custom in the past, he would suggest that this report be made at the meeting of the Section on Education and Legislation. The suggestion of the Chairman was followed.

The President called for the report of the Committee on Patents and Trade Marks. Dr. F. E. Stewart, Chairman of the Committee, stated that the custom had been simply to acknowledge the report as being ready and appoint a time when it shall be presented, either to the Association or some Section for consideration, this report being made to the Section on Education and Legislation. Dr. Stewart said that since he had been in the city he had conferred with several representatives of other associations; that there had been some suggestions made and the committee contemplated incorporating some, at least, of these suggestions in their report, and asked for a time when the matter could be discussed before the General Session.

The Chair asked for the wishes of the Convention in regard to this report.

Mr. Sayre said that he was impressed with the importance of this report and he really thought it would facilitate the business of the Association if the author of the report would consent to it first being read at the meeting of the Section on Education and Legislation and at their meeting an epitome or summary of it could be made and formulated to be presented to the General Session. Therefore, in order to save time, Mr. Sayre moved that this report be presented at the meeting of the Section on Education and Legislation. This motion was seconded by Mr. Harry B. Mason, and carried.

Mr. Mason then suggested that as it was now six o'clock, the further reading of reports be dispensed with and a recess taken in order to have the Committee on Nominations appointed in the regular way. Mr. Caswell A. Mayo moved that the by-laws be suspended and that the Association proceed with the election of the Nominating Committee, which motion was duly seconded.

President Beringer stated that he did not think it would really expedite business to do this, and he had some doubt as to the legality of the proceeding.

Upon a vote of the Association, Mr. Mayo's motion was carried.

President Beringer then announced that in accordance with the motion as adopted the Association would proceed to the selection of the Nominating Committee, and that a motion to take a recess to enable each set of delegates to select its members on the Committee would be in order.

On motion of Dr. William Mansfield of New York City, duly seconded and carried, a short recess was taken.

The President then proceeded to call the roll, and each State filed two names as a Nominating Committee.

The Chair then appointed as the five members at large on the Nominating Committee, the following:

Henry M. Whelpley, of St. Louis;
Joseph P. Remington, of Philadelphia;
Harry V. Army, of New York, N. Y.;
Charles Holzhauer, of Newark, N. J.;
Edmund N. Gathercoal, of Chicago, Ill.

Mr. Mayo then moved that the report of the Committee on Credentials be received and referred to the House of Delegates; motion duly seconded and carried.

The following telegram was read and the Secretary was directed to reply that the business of the Association precluded the acceptance of the offer it embraced:

New York, Aug. 24, 1914.

G. M. Beringer, President of American Pharmaceutical Association, Pontchartrain Hotel, Detroit.

If program can be arranged we offer an address by Wm. J. Burns as a follow to his Philadelphia address before convention of National Association of Retail Druggists. Address contains no solicitation of business—strictly professional matter of general interest to pharmacists. Wire our expense fourteen fifteen one Broadway.

MEDICAL LEGAL PROTECTIVE CORPN.

Thereupon a motion to adjourn was put and carried, and the Association stood adjourned to meet Tuesday morning, August 25, 1914, at 9:30 a. m.

INSTALLATION ADDRESS OF PRESIDENT C. A. MAYO.

DELIVERED AT THE LAST GENERAL SESSION.

Fellow Members of the A. Ph. A.:—

I thank you for having bestowed on me the highest honor which may come to an American pharmacist—the Presidency of the American Pharmaceutical Association.

Deeply conscious as I am of how far short I fall of the lofty standard of knowledge and ability set by my illustrious predecessors in the presidency, I can assure you that not even the greatest of them can outdo me in the sincerity of my devotion to the best interests of the Association of which all Americans, whether pharmacist, physician or layman, may justly feel proud.

It is with a profound sense of the gravity of my task that I assume the direction of the affairs of this continent-wide organization. No, not the direction of its affairs, but rather a part in its affairs. For my dear friends—and I honestly feel that I may so regard every person in the sound of my voice—this is no autocracy that I am called upon to rule. This is the purest form of democracy and as the president I realize that I am but one of scores of eager, willing, able and thoughtful workers toiling for the good of the American Pharmaceutical Association, which means for the good of every phase of pharmacy.

I fully realize and shall during my brief term of office endeavor to accentuate the fact that this association is all-embracing, all-including. From the humblest village drug-store to the most palatial emporium on Broadway, from the struggling beginner striving to wrest a meager livelihood from an unwilling public, to the vast hives of industry whose thousands of skilled workmen have made American pharmaceuticals known in the remotest markets of the world, all who have to do with honest pharmacy, are under the ægis of the American Pharmaceutical Association.

I deem it a most happy omen that it was in this city, just twenty-six years ago, that I first attended a meeting of the American Pharmaceutical Association. Unknown and abashed I came and listened to the words of wisdom which fell from the lips of Lloyd, of Bedford, of Maisch, of Shepard, and of all that brilliant galaxy of men who then guided the fortunes of this organization. I was profoundly impressed with the knowledge, the fervor, the devotion of these leaders to the highest ideals for pharmacy. Let us hope that the young men now in the sound of my voice who have come for the first time to the meeting of the American Pharmaceutical Association may be impressed now as I was then, by the sincerity of our devotion to the cause of pharmacy and may we be able to light in their hearts, as these leaders of 1888 lit in mine, a fire of enthusiasm for this Association which may burn unceasingly to the end of life.

I am conscious that I take up the obligations of this high office at a serious juncture. We find ourselves suddenly cut off from sources of supply upon

which we have long depended for many important drugs. It is incumbent on the American Pharmaceutical Association to assume leadership in the effort to supply these deficiencies so that the sick and the suffering may not be deprived of those drugs which will cure their illness and alleviate their pain. We have already initiated this movement and shall press it unceasingly to a successful issue.

The commerce of the world has been paralyzed by the stroke of the mailed fist of war. But that paralysis is only temporary. The millions of men engaged in mutual slaughter are the men who have furnished the greater part of the manufactured products of the world. Now their looms are idle, their anvils silent, their factories closed, but

There is some soul of goodness in things evil
Would men observingly distil it out.

And we in America, happily far from war's alarms, must earnestly endeavor to distil out the "soul of goodness" from this evil thing of war. We must carry on the commerce of the world. We must provide the products for the world's consumption which have come from European factories and laboratories. American pharmacy and chemistry must do their share of supplying the medicines of the world. We have in this crisis a wonderful field of work for all our educated and skilled pharmacists and chemists. And if our manufacturers fully utilize this opportunity we shall have such a commercial and industrial awakening as will make American pharmacists the most prosperous in the world and place this Association in such a condition of prosperity as will insure its future for all time.

Our field is the world. Our schools will be filled with foreign students, our laboratories busy with foreign orders and both our intellectual and our commercial life given an impetus which will make the United States the leader among the nations and the American Pharmaceutical Association the most powerful agent for good in pharmacy throughout the world.

REPORTS FROM THE SECOND SESSION.

REPORT OF THE RETIRING GENERAL SECRETARY AND EDITOR OF THE JOURNAL.

J. H. BEAL.

By consent of the Council and of the Committee on Publication, the active conduct of the Journal was turned over to Mr. Ernest C. Marshall, June 1, 1914, since which date Mr. Marshall has attended to the editing and publication of the papers therein contained and has written all of the editorials. The excellent manner in which this work has been accomplished speaks for itself.

On June 1st the transfer of the duties which relate particularly to the office of General Secretary was also begun, and was carried out as rapidly as circumstances permitted. Much correspondence has continued to come to my office, which has been disposed of either directly or by reference to the Acting General Secretary, Mr. Marshall.

As a matter of course, the salary of the General Secretary terminated at the time of the transfer of the active duties of that office to Mr. Marshall, since which time bills have been rendered only for postage and such other incidental expenses as were necessary to the transfer of materials from Scio to Columbus.

Report of Financial Transactions Through the General Secretary's Office:— Shortly after June 1st the retiring General Secretary placed in the hands of the Auditing Committee an itemized account of the financial transactions of his office for the fiscal year 1913, and for the first five months of the fiscal year 1914, accompanied by the corresponding books of record and vouchers. These accounts have been passed upon by the Auditing Committee and the report of such committee, together with the original itemized account of the General Secretary, are in the hands of the Acting Editor and General Secretary for report and publication.

*Storage of Proceedings and Historical Material:—*The accumulated volumes of Association Proceedings formerly in care of the Wickersham Printing Company, of Lancaster, Pa., and those formerly kept in a storage warehouse at the city of Baltimore, together with certain boxes containing documents of historical interest have, for nearly three years past, been stored in the building formerly occupied by the Scio College of Pharmacy, at Scio, Ohio, in which building the General Secretary's office has also been located. This building is the property of the Pittsburg College of Pharmacy and has been occupied by the Association free of rent.

As the building had been vacant for some years prior to our use of it, some minor repairs upon the roof and spouting were necessary, as was also the purchase of coal for the purpose of drying out the building after prolonged

spells of wet weather. In view of the generous action of the Pittsburgh College of Pharmacy in granting us the free use of the building, I feel that the expenses incurred in these incidental repairs and for fuel should be met by the Association.

When the building is once more closed (as it will be when the retiring Secretary ceases to occupy an office therein, it is probable that the rooms will again become damp, through lack of ventilation, and the volumes of proceedings and other materials there stored will be liable to mould and mildew. The necessity of arranging for the proper care of this material has been placed before the Publication Committee and will no doubt be given proper attention.

Suggestions Concerning the Journal:—Article 2 of Chapter X of the By-Laws provides that papers presented to the Association and its branches are reserved for first publication in the Journal, except by consent of the Publication Committee. This rule has been liberally interpreted, and the privilege of advance publication by other journals has been granted whenever asked for. Since it has been proposed that the rule requiring the consent of the Publication Committee be abolished, and since such action might materially interfere with the future prosperity of the Journal, it is desirable that the matter be seriously considered before any such action be taken.

The papers and communications presented at the annual meeting and before the local branches may be roughly divided into those which are of a general or popular nature, and consequently interesting to the casual reader, and those of a strictly scientific character which, notwithstanding their great usefulness to the progress of pharmacy, appeal only to a limited class of technical workers. If the rule requiring the consent of the Publication Committee be abolished, the probable result would be that the papers of a popular character would receive early publication in other journals and, consequently, would be considered stale when printed in the official Journal; while to the latter would fall the exclusive publication only of such papers as were of a technical and scientific nature.

The rule reserving the exclusive right to first publication in the official organ is a common one among scientific and professional organizations and, as far as my observation extends, has never been seriously objected to except in the case of the American Pharmaceutical Association.

Unless very good reasons can be cited to the contrary, it would seem better that the present rule be continued, with the understanding that the Editor shall have liberal discretionary power to give consent to prior publication in other journals of papers presented at the annual meetings and before the local branches.

It should be remembered in this connection, that the Journal is in no sense a competitor of other drug publications. The necessity for requesting permission to print a paper before its appearance in the Journal certainly does not impose any serious hardship, and since the Journal is an exclusive Association organ, and does not infringe upon the general field of drug journalism, there should be no more objection to quoting from its pages than to quoting from a government publication.

The Program for the Annual Meetings:—From his intimate relation to the internal affairs of the Association, the General Secretary is in a position to realize acutely the necessity for a rearrangement of the annual program so as to better conserve the time available for the presentation of papers and discussions, and for the conduct of the routine activities of the Association at the annual convention.

Very wisely, it was early decided to place the business and financial affairs of the Association, and the direction of routine matters generally, in the hands of the Council, which body has generally been made up of members well experienced in the affairs of the Association by service in various official capacities. It was also wisely provided that the acts of the Council should always be subject to revision by the Association. Though not expressly so provided in the by-laws, it has been the custom to read the Council proceedings in full at the general sessions. This may have been satisfactory at a time when the activities of the Association were few in number, but at the present time the matters brought up for Council consideration are so multifarious, and frequently so lengthy, that the reading of these minutes has come to consume a large and undue proportion of the time allotted to the General Sessions.

In order to secure the undoubted advantages of the general direction of the affairs of the Association by a select body of experienced members, and at the same time retain a full measure of control in the hands of the general membership, while relieving the General Sessions from the burden of listening to the recital of Council minutes, I make the following suggestions:—

(1) That the portion of Article 1, Chapter VII of the By-Laws, which provides that any member of the Association may attend the meetings of the Council, be elevated to the dignity of a separate article, so as to emphasize the fact that Council meetings are open to attendance by all members of the Association; and also that the requirement of a vote of the Council in order to permit non-members of the Council to speak, be changed so as to require only the consent of the presiding officer.

(2) That Section 3, Article 8, of Chapter VII be changed by striking out the requirement that the names of candidates for membership be read at the general sessions. Under our present practice there exists the anomaly that between annual meetings members are elected exclusively by vote of the Council, while if elected during the annual meeting, they must also be voted upon by the Association.

(3) That the practice of reading the minutes of the Council at the general sessions, which seems to be a matter of custom only and is not an express requirement of the by-laws, be done away with, and the Council left free to present to the general sessions only such matters as it deems of sufficient importance to require such reference.

The same suggestion has been offered by Mr. Harry B. Mason, and has my hearty approval.

(4) Add a new by-law to Chapter VII, giving to any member of the As-

sociation, during any general session, the right to call for a report from the Council upon any matter which has received its consideration.

Such a rule, coupled with the provision permitting all members to attend the Council sessions, and the reserved right of the Association to reject or modify Council action would provide ample means for full control of the Council by the Association and, at the same time, eliminate from the general sessions the tedious reports of the trifling, though necessary, details of general business affairs.

The House of Delegates:—The suggestion that the House of Delegates be abolished, prompts the retiring Secretary to recount some of the reasons which induced the Council to provide for its establishment at the Denver Convention.

(1) The by-laws for a long period of time have provided for the reception of delegates from various pharmaceutical institutions and associations, and for the examination and acceptance of the credentials of such delegates, but have failed to express the status of such delegates at the convention or to provide for them any proper function. Each year numerous delegates have appeared at the annual meeting and presented their credentials, and when they inquired as to their status in the convention, were advised that they were simply delegates and nothing more. Naturally, many of those who had been appointed by their local associations, and had received instructions as to the lines of policy which they should advocate, felt that the situation was more or less farcical, and some of them have been offended by the apparent lack of consideration which they received. By the creation of a House of Delegates these appointees were provided with certain definite functions and were made to realize that a delegate was something more than an empty name.

(2) Those who have closely observed the workings of the Association have realized that there should be some more decided and effectual method of acquainting the association in annual convention assembled of the requirements of pharmacy in the different sections of the United States. The creation of the House of Delegates provided a natural and easy means whereby the different sections of the country and the various divisions of pharmaceutical activity may present in a formal and effectual manner their recommendations for the formulation of the general policy of the Association.

(3) Associations such as ours have usually provided for a body known as the Committee on Resolutions, the principal function of which is to formulate general declarations concerning the policy of the Association. Considering the constitution of the House of Delegates, with its representation from the various branches of pharmacy and from the various geographical divisions of the United States, it is most admirably adapted to serve as such a General Committee on Resolutions and to prepare for final consideration and adoption the formulated expressions of the Association upon matters of general pharmaceutical and public interest.

(4) It was believed that the House of Delegates was the natural and logical place for receiving the credentials and recommendations of the representa-

tives of sister pharmaceutical organizations. The Association cannot, without a near approach to rudeness, recognize the credentials of delegates from institutions and organizations and then deny them a place on the program. If it receives the greetings and reports from some of these delegations, it should receive them from all; while if it receives reports from all of the delegations in the General Sessions, the time devoted to the latter will be unduly prolonged. Thus a House of Delegates is not only the logical place for the reception of these delegations, but affords the Association the opportunity of learning the sentiments of the various organized branches of pharmacy and of the trade in general in various parts of the country.

The Various Sections.—While it is true that sections should not be needlessly multiplied, we should not lose sight of the fact that it is quite impossible for all of our members to be equally interested in the same topics, and that those who are deeply interested in closely related lines of work will prefer to come together in a section especially devoted to such related subjects.

The real test as to the necessity of a section seems to me to be the degree of interest manifested by the members who take part in the work of that section. If these are sufficient in number to insure the preparation of interesting programs and well attended sessions, the necessity for the existence of such a section would seem to be well established.

Regarding the Section on Pharmacopœias and Formularies, to the continuance of which some objection has been made, I take the liberty of calling attention to the fact that the establishment of such a section was for a long time one of the favorite ambitions of one of our most distinguished and useful members, the late Oscar Oldberg; that its establishment was the subject of his last communication to the Association, and that this Section is practically a memorial to Professor Oldberg's faithful services to the Association and to the cause of professional pharmacy in general.

The creation of this Section has enabled us to appeal to the interests of food and drug chemists and officials charged with the administration of food and drug laws in a more effective manner than ever before, and has brought home to such persons in a most emphatic way a knowledge of the fact that the American Pharmaceutical Association is an important factor in the development and establishment of practical and rational standards for drugs and chemicals.

In my opinion, if any change is made in this Section, it should be to broaden its title to the "Section on Pharmacopœias, Formularies and Drug Standards," all of which are closely related topics and can better find representation in a section devoted to their especial consideration than in any other section of the Association.

In conclusion, it is a matter of deep regret to me that I am unable to be present with you in person, this making the first annual meeting which I have been unable to attend since the meeting held in Chicago in 1893.

My interest in the welfare of the Association has not lessened, however, and, though circumstances will not permit my again undertaking any official duties that would impose serious and continuous responsibility, I hope to be

able to take active part in the proceedings of the Association, as a plain member in the ranks, on many future occasions.

In retiring finally from office, I wish to assure you of my profound gratitude for the official honors received at your hands in the past, which I cannot help but realize have been much in excess of my deserving, and to express my appreciation for the helpful and sympathetic consideration received from the members and officers during the period of my service as your General Secretary and Editor of the Journal.

Respectfully submitted,

J. H. Beal.

Notary Public, City of St. Louis, Mo.

My term expires June 11, 1917.

REPORT OF THE COMMITTEE ON THE WILLIAM PROCTER, JR.
MONUMENT FUND.

The Committee on the William Procter, Jr. Monument Fund is pleased to report that sufficient money has now been subscribed for the erection of the proposed monument, and the amount that has been collected will be reported by the Treasurer of the American Pharmaceutical Association at the proper time.

The membership of the Association can well appreciate the pleasure and the relief to your committee in having attained this condition after ten years of patient

THE PROCTER MEMORIAL.
(MODEL BY EDWARD BERGE.)

and persistent effort. At first we felt disappointed in this project because of a certain lack of interest. A small subscription from each pharmacist would have secured the required sum in the first year of our work, but on reflection we realized that this lack of interest was due to the fact that the character and the history of William Procter, Jr., and the services that he rendered to Pharmacy were naturally not a matter of common knowledge to the pharmacist of this day and generation. He was so conspicuously the early leader of that important period in the development of Pharmacy in this country. Our appeals have been in keeping with his character and the proposition to venerate the memory of the Father of American Pharmacy has been without intention of annoying or embarrassing anyone, and no scheme or other device has been adopted by your committee which was undignified or unprofessional.

Mr. Edward Berge has been selected by your committee as the sculptor for the work, and during the past year we have devoted much time to the details of the monument and can now report a model that is surprisingly exact. On May 3rd a meeting was held at the Philadelphia College of Pharmacy and particular pains were taken to have in attendance those friends and former students of Prof. Procter, who had known him in life. The object of this meeting was to give those intimates of William Procter, Jr. an opportunity to inspect and criticize the model which Mr. Berge had developed from photographs of him and the expressions of approval were very gratifying.

The following resolution was unanimously adopted by that meeting:

Resolved, That the work of Mr. John F. Hancock in connection with the Procter Memorial be approved, and that the model and design of Mr. Edward Berge, of Baltimore, for the statue be accepted.

Personal contact with Mr. Berge has been of material advantage in the evolution of this monument and it is the opinion of all who have seen the model that the likeness to Prof. Procter is more than is usual for work of this kind.

We have every assurance that we can obtain a selected site in the Smithsonian Grounds for this statue, but the time of Congress has been so taken up by special legislation, this year, that it was thought advisable by your committee to postpone our efforts in that body until the next session.

With these details attended to, the American Pharmaceutical Association can make its preparation for the unveiling of this monument in Washington in 1917—the Centennial of the birth of William Procter, Jr.

In furtherance of which is appended the following:

Resolved, That the Committee on the William Procter, Jr. Monument Fund be authorized and empowered to contract for the monument in all of its details of completion, dedication and transference to the National Government with the power to draw on the Treasurer of the American Pharmaceutical Association from the moneys belonging to the William Procter, Jr. Monument Fund to pay for all resulting expenses.

REPORT OF THE COMMITTEE ON STATUS OF PHARMACISTS IN
THE GOVERNMENT SERVICE.

The efforts of our committee during the past year were chiefly devoted to an attempt to secure more equitable treatment for the men responsible for the pharmaceutical service in the army.

Our members are already acquainted with the provisions of the Hughes-Bacon bill which was drafted in accord with the recommendations of the Surgeon-General, to the Chief of Staff (August 3, 1911) and introduced into the 62nd Congress by Representative Hughes and Senator Bacon. This bill is intended to promote the efficiency of the pharmaceutical division of the army known as the Hospital Corps. It provides for the creation of a higher class of non-commissioned officers to be known as sergeants-major, thereby affording opportunity for promotion such as already exists in other staff corps of the army. The bill also provides slight increases in pay for the lower grades of non-commissioned officers of this corps, so as to remove the discrimination against the Hospital Corps which has existed since the enactment of the Army Pay Bill of 1908.

Resolutions urging support of our bill were passed by this association also by the N. A. R. D. and by many state associations. The bill was favorably commented on by the Journal of the American Medical Association. (See Journal A. Ph. A., Vol. 1, pages 95, 98, 427 and 1183.)

Notwithstanding the efforts of our committee assisted by our members no action was taken by the 62nd Congress. With the co-operation of Dr. Payne, the bill was re-introduced in a slightly modified form at the 63rd Congress by Representative Hughes and Senator Bacon, being the first bill in the calendar in the House. Meanwhile, the Surgeon-General of the army again called attention to the need for this legislation in his annual report to the Chief of Staff for 1912. (See Journal of the A. Ph. A., Vol. 3, page 13.)

The bill was referred to the sub-committee on Military Affairs of the House, a hearing was granted; a brief and argument were filed. Dr. Payne, Mr. Hilton and Mr. Richardson appeared before the sub-committee. Colonel Gandy, the acting Surgeon-General, was called before the committee and the outlook seemed bright. At this time, we wrote to many members of the Association urging them to address communications to their senators and representatives asking support for this bill. Our members responded in a most satisfactory manner and in many cases enclosed favorable replies which they had received from their senators and congressmen. Then, when all seemed favorable, we found that our efforts were blocked. The sub-committee delayed its report and after some investigation we found that the opposition came from the Secretary of War whose powerful influence has been sufficient to nullify our efforts up to this time.

Apparently there is now no prospect of favorable action on our bill. Evidently, we must draw up a new bill, one that will meet the approval of the Secretary of War before we can hope for success.

Our committee is in favor of asking *commissions* for pharmacists in the Hospital Corps. We believe that the military committees of Congress would consider such a proposal with favor. The advantage would be two-fold: it would provide a class of commissioned officers for the Army Hospital Corps—the only corps in the army which lacks such officers—and it would be a recognition of the professional status of pharmacists. We urge that the active efforts of our association be devoted to this cause.

While in Washington, Dr. Payne appeared before the comptroller of the treasury in behalf of the pharmacists of the United States Public Health Service and urged an increase in their commutation of \$25 per month which has been granted within the past few weeks.

W. B. DAY, Chairman.

REPORT OF COMMITTEE ON WEIGHTS AND MEASURES, AMERICAN PHARMACEUTICAL ASSOCIATION.

To the American Pharmaceutical Association:

Your Committee on Weights and Measures begs leave to submit the following report of its activities during the year.

Appreciating that the primal purpose of this committee when created by the Association over twenty years ago, was the furtherance of activities designed to promote legislation in favor of the metric system in this country, your chairman felt the best work that could be done this year was the re-opening of the question of a campaign of publicity on behalf of the metric system.

Accordingly, as soon as the president of the American Association for the Advancement of Science, and the president of the American Chemical Society were elected for the current year, the following letter was sent to each of these gentlemen.

Dear Sir: As chairman of the Committee on Weights and Measures of The American Pharmaceutical Association, I take the liberty of writing you to ask whether the time is not ripe for those national associations interested in the metric system to start a systematic and persistent campaign toward the ultimate adoption of the metric system as the official standard of weights and measures in this country.

I am not unmindful of former legislative action in this direction culminating in the Stone Bill of 1896. Having assisted in a modest way in the work on the part of the pharmacists to secure such legislation, I fully realize the difficulty in approaching the problem of legislation on the subject unless backed by intelligent public opinion and my thoughts just now turn to a campaign of education as a prelude to a campaign of legislation.

Some six years since, when a metric bill was before Congress, I wrote, as secretary of a pharmaceutical association to Congressman (now Senator) Burton of Ohio, and received from him a very courteous reply expressing interest in, if not approval of the adoption of metric units by our country but also stating that he had received many more protests against the bill than requests for its passage.

And, in closing, he put his finger right on the weak spot of such legislation by saying the opposition came chiefly from manufacturers of machinery whose thread-cutting devices were on the inch basis instead of gauged to millimeters. He further intimated that the education of manufacturers was pre-requisite to the passage of metric legislation.

What I have in mind is something like this.

We pharmacists have, during the last twenty years, been educated to the metric system by the adoption of metric units in the Pharmacopœia of 1890 and their retention in the edition of 1900 and in the one of 1910, which we are now preparing. While there was much opposition at first, (even to the extent of the dispensaries providing alternate recipes with quantities in the old systems.) I have reason to believe that 90% of the druggists are now preparing their pharmaceuticals by metric recipes. Of course, all chemists and physicists use the metric system, so, in the organization of which you are president, in the American Chemical Society and in the American Pharmaceutical Association we have three organizations that believe firmly in the metric system and whose members practice what

they preach by daily use of metric units. And, likely, you can suggest other national bodies who, like us, favor the metric system.

If Senator Burton's view is a correct one, we must secure the co-operation of the national engineering societies and in order to win and to do this, these national bodies favoring the metric system should through a joint committee first attempt the winning of the engineering societies to our side and then, the combined forces should start a campaign of education through the manufacturers' associations, through chambers of commerce and through the press. The three associations—A. C. S., the A. A. S., and the American Pharmaceutical Association—could conduct such a campaign with great efficiency through local committees, since, in practically every important city, such organizations have local branches or sections to which members of the A. A. S. belong. We might also secure the coöperation of the American Medical Association with its powerful network of local sections. Certainly, we can get the help of those A. M. A. members who belong to the A. A. S.

The appeal to commercial organizations should be made on a dollars-and-cents basis. The great South American continent has been barely scratched by the American business man who has permitted the Germans to largely monopolize the trade. And that, if reports are to be credited, largely because the South American merchant, familiar with the metric system, prefers to get his goods marked in that system rather than in our cumbersome system of units.

Winning the coöperation of the commercial bodies, the passage of a metric bill by Congress will be practically assured.

Very sincerely yours,

A similar letter was sent to the President of the American Chemical Society on Jan. 8th, and the replies to the two communications are given below:

Dear Sir: I have your letter of Dec. 29th relating to the question of the metric system. The matter is certainly a very important one and I should think that it might very well be taken up by the American Association for the Advancement of Science. I will place your letter on file and bring the matter up before the Council of the Association when the opportunity offers. It is probably impracticable to take any further action at present but the Council meets in April, when perhaps something can be done.

Very truly yours,

(Signed) EDMUND B. WILSON.

Dear Sir: Your letter interests me, and I shall be glad to bring the matter before the Council of the Society in September. There is not much opportunity for doing anything in the summer when everybody is away, in the country or in Europe. The points which you make are good.

Although of course on the whole I favor the metric system, especially for scientific work, I can't help feeling that the nomenclature is very cumbrous. The names of common measures ought to be monosyllabic or at least not more than disyllabic, whereas "cubic centimeter" has six syllables. I think that this difficulty has militated seriously against the use of the system. For many purposes also the metric system is inconvenient because of the complication in computing quarters, thirds, sixths, and eighths.

Very sincerely yours,

(Signed) T. W. RICHARDS,
(President American Chemical Society.)

An interesting report of Chairman F. R. Drake, of the Committee on the Metric System of the National Wholesale Grocers' Association led not only to correspondence with this gentleman, but also to a personal interview with him and his colleagues, Mr. A. W. Beckmann, secretary of the Association, and Mr. Dana T. Ackerly, the Association's counsel. These three gentlemen were found to be very enthusiastic over the metric system and pointed out that the National Wholesale Grocers' Association passed, two years since, a resolution directing that the proper committee take up work for the metric system along educational lines with the eventual purpose of the compulsory adoption of the metric system in the United States; that this action was approved at the meetings of wholesale grocers of Pennsylvania, New Jersey, Delaware, West Virginia, Ohio, Indiana, Illinois, Iowa, Missouri, Kansas, Nebraska and Wisconsin, and that the National Retail Grocers' Association went on record this year favoring the metric system.

Correspondence with Dr. S. W. Stratton, Director of the Bureau of Standards has not yet brought a response.

The present revival of interest in the metric system in this country, as shown above, is encouraging and it is hoped that the campaign that is now beginning will be along sane lines of education for some years to come, rather than an attempt to rush legislation before the public opinion has been shaped to accept metric units.

The American Association for the Advancement of Science and the American Chemical Society can likely be counted on for support in a campaign of education; our association has worked for the system for almost a score of years; the grocers, both wholesale and retail, at their national conventions have gone on record in favor of the system and it should not be difficult to enlist the aid of the National Wholesale Druggists' Association. These bodies acting together should wield considerable influence among the chambers of commerce and similar business bodies throughout the country and if the coöperation could be secured—which is by no means impossible—a long step will be made toward putting this country among the metric nations of the world.

As some of the members of the committee think we should submit a summary of legislative activities during the past year that affected weights and measures, information concerning the Federal Net Weight Law and the new Massachusetts law is appended.

THE FEDERAL WEIGHT LAW passed last year is the topic discussed in Food Inspection Decision No. 154, in which are published regulations for the carrying out of the law.

These regulations apply to foods shipped in interstate commerce or sold in the District of Columbia or the territories, and become effective at once, although the law, passed March 3d, 1913, as an amendment to the food and drugs act, defers the exacting of penalties for violations until September 3d, 1914.

The regulations in general require that the manufacturer of foods shall plainly mark all packages, bottles or other containers holding more than 2 ounces avoirdupois, or more than 1 fluid ounce, to show the net weight or volume of the contents. The measure must be stated in avoirdupois pounds and ounces, U. S. gallons, quarts, pints, or fluid ounces, U. S. standard bushels, half bushels, pecks, quarts, pints, or half pints. The contents by a like method may be expressed in terms of metric weight or measure. The volume of liquids must be computed at 68° F.

The quantity stated on the container must represent the actual quantity of food exclusive of wrappings and container.

In general solids must be stated in terms of weight and liquids in terms of volume, except that where there is a definite trade custom otherwise any marking of the package in terms that are generally understood to express definite quan-

tities will be permitted. The quantity of viscous or semi-solid food or of mixtures of solids and liquids may be stated either by weight or measure, but the statement must clearly indicate whether the quantity is expressed in terms of weight or measure.

In the case of certain articles the contents may be stated by numerical count, provided such numerical count gives accurate information as to the quantity of food in the package. Under this requirement it would not be enough to state that a package of candy contained 24 cream peppermints, as candies vary in size, and this would not be a statement of the actual quantity of candy in the package.

The regulations also permit the statement of minimum volume or weight as "Minimum weight, 12 ounces," "Minimum volume, 1 gallon;" "Not less than 4 ounces." In such cases the amount stated must approximate the actual quantity. No variations below the stated minimum quantity will be permitted.

The statement of weight or measure must be marked in terms of the largest unit contained in the package; for example, if the package contains a pound and a fraction, the contents must be expressed in terms of pounds and fractions thereof, or pounds and ounces, and not merely in ounces.

As to tolerances and variations from quantity of contents marked on the package, the following are allowed: Unintentional errors in packing; discrepancies in capacity of bottles, when it can be shown that as many bottles are over size as under size; discrepancies in weight due to effervescence.

Packages containing 2 avoirdupois ounces or less, 1 fluid ounce or less or six units or less are exempt from the labeling of the law.

MASSACHUSETTS' WEIGHT LAW.

As a result of the sensational statements made by the Sealer of Weights and Measures of Massachusetts relative to the large number of inaccurate weights and measures found by him and his deputies, the legislature of that state recently passed a law providing for the testing of weights and measures used by apothecaries. So far reaching is the scope of the bill that it applies to the graduates and weights and measures of any and all kinds used by hospitals, private sanatoriums and other retreats, physicians and district nurses.

The act takes effect immediately. This is the salient section: "Apothecaries and all other persons dealing in or dispensing drugs or medicines or merchandise sold or given away, by apothecaries' weights and measures so used to be tested and sealed by the sealers of weights and measures in the respective cities and towns in which they carry on business; provided, however, that if a graduated glass measure has once been sealed by a sealer of weights and measures, it shall not in any case be necessary to have it sealed again at any time while it remains in the same conditions in which it was first sealed."

The bill provides that any person who uses apothecaries' weights and measures in any form and who does not comply with the provision of this law in having the weights tested shall be punished by a fine of not less than \$5 nor more than \$50.

Resolved, That the American Pharmaceutical Association is pleased to hear of a revival of a campaign aiming to make the metric units the official system of weights and measures in this country.

Resolved, That this Association, now, as in the past, stands ready to aid in accomplishing this purpose and hereby direct the next committee on weights and measures to coöperate with the American Association for the Advancement of Science, the American Chemical Society, the National Wholesale Grocers' Association and all other interested bodies in an educational campaign in interest of the metric system.

Resolved, That this Association take steps to enlist the support of the National Wholesale Druggists' Association in the proposed campaign on behalf of the metric system.

H. V. ARNY, Chairman.

REPORT OF DELEGATES TO THE NATIONAL DRUG TRADE
CONFERENCE.

To the Officers and Members of the American Pharmaceutical Association:

The report of the delegates to the National Drug Trade Conference submitted at the last meeting of this Association covers briefly a history of the organization and the purposes of the Conference; and was necessarily devoted largely to the work of the Conference in connection with H. R. 6282.

From this it might appear that the main purpose of the Conference was to effect appropriate anti-narcotic legislation. Nothing could be further from the truth. The Harrison Bill is merely an incident, and yet, because of the situation that has existed in Congress for more than a year, it is practically the only legislation that the Conference has had much to do with.

Since the last meeting of the Association the Conference has held one session; the full proceedings of which were published in the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, for February, 1914; and are therefore not repeated at length in this connection. It may be pointed out, however, that the Form of the Organization was changed so as to provide for an Executive Committee of seven instead of five, thereby insuring representation on the Executive Committee of each constituent association of the Conference.

That the Association may have a better understanding of the scope of the work of the Conference, it is remarked at this point that besides the Harrison Bill, consideration was given to legislation regarding Bichloride Tablets, a regulation for the mailing of poisons, price standardization, and some fifteen bills amending the Food and Drugs Acts of June 30, 1906. Much of this proposed legislation is regarded as inimical to the interests of the drug trade, and, as the Proceedings will show, the Executive Committee was instructed to frame and file briefs with the proper committees of Congress, which work was divided between sub-committees at a subsequent meeting of the Executive Committee of the Conference, held March 18, 1914. The necessity of immediate action was eliminated by the fact that individual members of the Conference had been assured that Congress would not consider any of the several measures during the present session. The sub-committees are preparing to be heard when an opportunity is afforded during the next session of Congress, and the interests of the drug trade are being most faithfully conserved. It is almost superfluous to inform the Association of the present status of the Harrison Bill. The Bill, as it passed the House, was amended by the Senate in several particulars, and then passed. The House refused to accept the amendments of the Senate, and conferees were duly appointed. In the Senate a record-keeping-provision was put in the Bill as a result of the action of the Executive Committee at the meeting held March 18, 1914. The record-keeping-provision as adopted by the Executive Committee was not intended to compel the physician to make a record of administrations, but did require him to make a record of narcotics dispensed, sold, distributed, or given away. Unfortunately, as your delegates think, Senator Nelson introduced an amendment requiring physicians to make a record of narcotics administered, as well as those dispensed, sold, distributed, or given away. This unreasonable amendment brought out the determined opposition of the medical profession of the country, and resulted in an amendment being introduced by Senator Pomerene exempting the physician and his nurse from the operation of the act altogether, practically nullifying the law. To save the bill, because if there were a serious contest it would go over the present term, Senator Thomas consented to the elimination of the record-keeping-provision, otherwise the Beal amendment; whereupon Senator Pomerene withdrew his amendment.

Protest has been made against the Bill as it now stands on account of the absence of this record-keeping-feature; but as it was not in the Bill as adopted by the House or Senate, the question of putting the record-keeping-provision back in the Bill cannot come up before the conferees.

To repeat what already has been stated the real difference between the Senate and House appears to be the Senate's amendment to section (a), striking out the words "personal attendance upon such patient," and substituting therefor: "having been employed to prescribe for the particular patient receiving such drug." It is possible that the House conferees may yield to the Senate; but, anticipating that both sides may desire to compromise, the Secretary of the Conference has suggested the adoption of the following in lieu of paragraph (a):

"To the dispensing or distribution of any of the aforesaid drugs by a physician, dentist or veterinarian registered under this act to a patient, in the course of his professional practice only; or by a nurse or attendant of such patient in accordance with the directions and instructions of such physician, dentist, or veterinarian, and in regular pursuance of such professional practice; provided that such drug shall be dispensed in good faith, and not for the purpose of avoiding the provisions of this Act."

There seems to be no real difference between the House and the Senate respecting the intended effect of the provision. The real question has been: what construction will the courts put upon the words "personal attendance"? If it were certain that the courts would adopt the interpretation that the House intends, the Senate would not object to the language; and the change made by the Senate is intended only to make the intent of the House certain. The language of the Senate, however, seems to those who object to it, to leave the way open to obvious abuses. The Secretary's effort has been to provide language that can not be misunderstood.

Before concluding, the Association should be informed that the Bill as adopted by the Senate provides that a physician must register under the Act, in order to lawfully administer, dispense, distribute, or give away; so there will always be a record of what the physician purchases, since no one can obtain narcotics without using the official order blank delivered only to those who register. On the other hand, likewise at the instance of the Drug Trade Conference, the words "registered under this Act" in Section (b) have been stricken out; thereby relieving the pharmacist from the necessity of knowing whether the prescription he receives comes from a physician who is registered under this Act.

In conclusion, your delegates would say that they believe that the operation of H. R. 6282 will prove the wisdom of the action of the Conference; especially if it is supplemented by appropriate state legislation equally effective and less complicated and less burdensome than now exists in many states. The Harrison Bill will remove the necessity of many of these burdensome and complicated provisions of state legislation by the very fact that it automatically provides a record of sales in interstate commerce.

It is the purpose of the Conference to suggest amendments to present state laws which the Harrison Bill will make feasible and safe, and we recommend a continued affiliation with the N. D. T. C.

Respectfully submitted,

JOHN C. WALLACE.

J. H. BEAL.

S. L. HILTON.

REPORT OF THE GENERAL COMMITTEE ON MEMBERSHIP.

Mr. President and Members of the American Pharmaceutical Association:

Your committee on Membership for the year ending August 29th, 1914, makes the following report:—

The Chairman, upon receipt of the names of the Committee, appointed by President Beringer immediately notified each of her or his appointment and at the same time asked their co-operation for a larger membership in our Association; with this letter, was sent a very comprehensive plan for a campaign outlined by President Beringer. This plan is an excellent one, has given good results and should be tried again, with more effort on the part of the succeeding Chairman, in obtaining the attention and work of the Committee along the lines suggested in the plan.

The Committee was a large one (285 members) and almost to a man they accepted the appointment and, in general, responded in an earnest way of their desire and anticipation of a large increase in our number of members.

By the number and tenor of the responses, one would be led to believe that we would have a very large number of new members to report at the end of the year. The Committee have been alive throughout the year, as shown by letters received by the Chairman with copies of their communications in many instances.

Lately, however, I have received word from a number of the Committeemen that it is a hard matter to secure new members, that the ground has been thoroughly worked before; that they are disappointed, have not been very successful although they have brought the matter to the attention of every pharmacist in their District. Some States have fallen down badly, not even the courtesy of a reply being received to several letters sent out.

So, after the Committee had been working a few months, a rally-day was named for the Committee, the notice of which was followed by two letters as follow-ups for this rally-day, and considerable interest was aroused with good results.

A few weeks afterwards another rally-day was set, this time for the entire membership, with the thought, that it would be well to place in the hands of every member of the Association, an application-blank and a short story on the benefits of our Association. This would not only secure new members but would show the workers and loyal men in the Association, "not known to the Officers," who would be of great benefit in future work.

To this end letters were sent out with follow-up letters twenty days apart; thus the membership was thoroughly circularized and application blanks were also placed in the hands of every member.

From this action very good results have been obtained and further returns are expected from this campaign as many of the Committee have recently been very active.

The lady members of our Committee have added their quota to our list of members and are at the present time using every effort to increase the number.

The Chairman is lead to believe by the experience he has had, that the subject of increase in membership must be worked out along the line of interesting the young people, for, as stated by one of the Committee, the members of our calling have been thoroughly solicited.

So it is to the recent graduate and the young business man we must look to and in this we are already receiving considerable help from some of our schools and colleges of pharmacy, which are awarding prizes for excellence in scholarship, in the form of memberships. I hope the number of such prizes will increase, for it brings into our Association the brightest young men.

The work of our Committee has lately been interested in procuring applicants from among the pharmacists in the Government service, where there is yet quite a field for recruits. The Island possessions have answered to our call very well, having a much larger proportion of their men enrolled, than the States. The Philippines, for instance, have recruited about sixty percent, with only about twenty-five percent of the Corps in the Islands. So there is work here in the States among the men in the service.

I wish to thank the President and every member of the Committee for their assistance and endeavors, and to say to them that we have done very well considering how well the ground has been covered in the past years and the calls and conditions the men of pharmacy have to-day.

Your Chairman regrets very much not to be able to make a better showing and report; perhaps this is due in part to the fact that he was ill and away from his office for over two months at the most important time of the year for membership work. However, this feeling is somewhat compensated for by the fact that we have broken the record of previous years, and, although the campaign has cost more than the original appropriation, the amount brought in by the number of new members in excess of previous years is more than enough to pay the whole expense.

REPORT OF THE COMMITTEE ON THE FORMATION OF LOCAL
BRANCHES.

In looking over the membership roll of the Association, your Committee on the Formation of Local Branches decided upon Detroit and Buffalo as the best locations for new branches. But we regret to report that our efforts to inaugurate Branches in these cities have been unavailing. From Detroit we got the information that a Branch could easily be started, but that there was lacking the sort of enthusiasm essential to its permanency. It was the belief of the active local members of the Association that the necessary enthusiasm would come after this annual meeting. This belief is shared by your committee.

Your committee found that several attempts had been made to start a Branch in Buffalo without success. There were not, and are not, sufficient enthusiastic local members to maintain interest in a Branch.

During the year two new Branches were inaugurated: one at Columbus, Ohio, and one at Jacksonville, Fla. And, following some correspondence from your committee, the activity of the Branch of San Francisco was revived.

As a result of its experience, your committee believes that the number of members required to inaugurate a local Branch should be reduced below twenty-five, and would suggest that it might be advisable to restrict representation in the Council to Branches having twenty-five members.

Respectfully submitted,

HUGH CRAIG, Chairman.

FRANKLIN M. APPLE.

REPORT OF SPECIAL COMMITTEE ON RULES AND BY-LAWS.

A special committee of three was appointed by the Council on Tuesday evening to carry out its will and to put in definite form certain measures voted upon and approved at that time. The Committee now reports as follows:

1. We recommend that the general rules of the American Pharmaceutical Association, as they stand at present, be numbered from one to seven inclusive, and that the following rules be added to the list:

Rule 8. Addresses of welcome and responses thereto at the opening general session shall be omitted.

Rule 9. The meetings of the Council shall be held in the evening with the exception of the first and the last sessions.

Rule 10. The work of the various sections shall start promptly in the morning at 9:30, lasting until 12 o'clock, and in the afternoon at 2 o'clock, lasting until 5 or 6.

Rule 11. The section and association meetings shall be confined to mornings and afternoons.

Rule 12. The principle of concurrent meetings of the sections shall be established. There shall be used a series of bulletins in the section rooms notifying members what papers are being read and discussed in the different several sections.

Rule 13. The chairmen of the sections shall use every endeavor to secure all manuscripts within four weeks of the annual meeting, and shall immediately send them to the general secretary.

Rule 14. The general secretary shall have accepted manuscripts printed in advance of the annual meeting, whenever in the judgment of the chairmen of the sections and the general secretary it is desirable.

Rule 15. With all manuscripts in hand three or four weeks before the annual meeting, the general secretary shall prepare a collective program containing the detailed programs of the different sections and indicating at what particular session any given paper shall come up for reading and discussion.

2. We recommend that Article 8, Chapter 9 of the By-Laws be amended to read as follows:

Article 8. The chairman of the Section on Practical Pharmacy and Dispensing shall appoint a committee of three on pharmacopœias and formularies to co-operate in the work of the section by obtaining papers on the subjects of pharmacopœias and formularies and discussions thereon. The officers shall arrange in advance of the meeting the business to come before the section.

3. We recommend that Article 2 of Chapter 9 of the By-Laws be amended to read as follows:

Article 2. To expedite and render more efficient the work of the Association, the following sections are provided:

1. Scientific Section, with four subdivisions: (a) chemistry, (b) botany and pharmacognosy, (c) biologic assays, (d) bacteriology.

2. Section on Commercial Interests.

3. Section on Practical Pharmacy and Dispensing.

4. Section on Pharmaceutical Legislation and Education.

5. Section on Historical Pharmacy.

6. Women's Section.

Upon the approval of the Council additional sections may be organized from time to time as necessitated. Each section, through its officers, shall solicit papers and propose suitable subjects for discussion at the annual meeting, arrange the business of the section in advance, and perform such duties as may be referred to it. It shall make reports to the Council or Association if requested. The conduct of the work of each section shall be under by-laws, rules and regulations approved by the Council. All committees proposed or appointed by the sections shall be subject to the approval of the Council.

4. We recommend that Article 1 of Chapter 7 be made into two sections, and that Section 2, at present the final sentence in Article 1, be made to read as follows:

Section 2. Any member of the association may attend the meetings of the Council and may, by permission of the presiding officer, be permitted to speak on any subject under discussion.

5. We recommend that Section 3 of Article 8 of Chapter 7 be eliminated from the By-Laws.

6. We recommend that Section 2 of Article 8 of Chapter 7 be amended to read as follows:

Section 2. The secretary of the Council shall submit to the Council the names of the candidates who have been proposed for membership, when a majority vote shall be sufficient to elect them.

7. We recommend that Section 6 of Article 11 of Chapter 9 be amended to read as follows:

Section 6: An abstract of the minutes of the Council shall be read at the annual meeting of the association, and the acts of the Council shall be approved, amended or revised so as to be acceptable to the association. At any general session, a member may request further information upon any matter reported on by the Council.

8. We recommend the introduction of a new article in Chapter 9 of the By-Laws, to be known as Article 11, and to read as follows:

Article 11. The Women's Section shall consist of women who are regular members in good standing in the American Pharmaceutical Association, and the women of the families of regular members in good standing, united for the purpose of promoting the aims of the American Pharmaceutical Association and for advancing the interests of women engaged in pharmaceutical pursuits.

9. We recommend that the articles in Chapter 9 of the By-Laws, beginning with and following Article 11, be renumbered as follows: Article 11 be made Article 12, and Article 12 be made Article 13.

10. We recommend that Article 1 of Chapter 10 of the By-Laws be amended to read as follows:

Article 1. There shall be appointed or elected standing committees as follows: A Committee on United States Pharmacopœia, a committee on transportation, and a committee on resolutions, each to consist of ten members; a committee on the Pharmaceutical Syllabus to consist of seven members; a committee on the time and place of meeting; a committee on Ebert Prize, and a committee on general prizes, each to consist of three members; and a committee on program.

11. We recommend the addition of a new article to Chapter 10, to be known as Article 8, and to read as follows:

Article 8. The reports of all committees of the Association must be sent to

the general secretary in time for presentation at the first general session of the annual meeting of the association.

12. We recommend the addition of a new article to Chapter 10 of the By-laws, to be known as Article 9, and to read as follows:

Article 9. The Committee on Resolutions shall be appointed at the first session of the annual meeting, five members by the president of the association, and five by the chairman of the Council. The committee shall hold open session for the consideration of matters referred to it either by the association, any section, or by the Council, and to obtain the opinion of the members thereon and report to the referring bodies.

13. We recommend the addition of a new article to Chapter 10 of the By-laws, to be known as Article 10, and to read as follows:

The Committee on Program shall consist of the local secretary, the general secretary and the secretary of the Council. It shall be the duty of the committee to prepare and submit to the Council the program for the annual meeting so that same can be published in the Journal at least two months in advance of the annual meeting.

HARRY B. MASON, Chairman.

JOS. W. ENGLAND,
F. W. NITARDY.

EUGENE G. EBERLE
CHAIRMAN OF THE COUNCIL.

JOSEPH W. ENGLAND
SECRETARY OF THE COUNCIL.

Scientific Section

Papers Presented at the Sixty-Second Annual Convention

REPORT OF COMMITTEE ON QUALITY OF MEDICINAL PRODUCTS—AUGUST, 1914.

The Chairman waited until July 16th for the usual valuable contributions of the other members of the Committee, at which time that of Prof. Scoville was the only one obtained. As the Chairman was to leave on a vacation the 31st it became necessary to leave each other member to submit a separate report.

The continued activities under pure food and drug legislation are undoubtedly working toward better standards and greater carefulness, but there is still a tendency to allow the enforcement of regulations to become one-sided and work serious and uncalled for injustice. In the near future this will result in reaction or in the establishment of better methods on the part of the authorities.

There is no good reason why goods sampled should not be sampled in duplicate and the sealed duplicate be given to the person supplying the sample. In the event of the department official finding his sample defective, the holder of the sealed duplicate should have the privilege of having it examined by an experienced chemist to learn if the original report is correct, and the result of this examination be made known to the department official. This might do away with some very serious mishappenings such as have transpired in the past. It is stated that one firm of manufacturers was widely advertised as adulterators and a quantity of goods destroyed, when subsequent investigation proved that they were of standard quality, but the department chemist had made an error in placing his decimal point, so that the goods were ten times too weak on paper only. Some restitution should be made in such cases, without putting the sufferer to still more expense in an effort to secure justification.

In another instance the product of a manufacturer was condemned in a department publication. The statement was spread broadcast and placed in the hands of every physician in the state. The chemist of the manufacturer called upon the official chemist for an explanation, but received scant courtesy. Later the manufacturer received a statement that the goods had been re-examined and found 66%, 76% and 87% from the same analysis. The chemist of the manufacturer finally obtained permission to assay the same sample in the official laboratory under the immediate supervision of the Asst. Dept. Chemist. The analysis which was signed and certified as to accuracy by the Asst. Dept. Chemist, made the product 109%. No one was authorized to undo the damage to reputation and business but the sufferer himself.

Other instances could be cited where products were said to contain ingredients that were not present and could not have been present. Prof. LaWall in the Am. Druggist is quoted as saying—"A great deal of money has been wasted by the Government and a great deal of unnecessary expense has been entailed upon manufacturers by prosecution on trivial charges which if true involved on real damage to the cause of pure food and pure drugs. A prosecution based upon 4 percent deficiency in the alcoholic content of tincture of opium, though the morphine content was fully up to the standard, a ruling that the presence of one vetch seed in a million of coriander would necessitate the labeling of a sausage in which this was present as "containing leguminous starch," a ruling against a sample of cresol because it differed one decimal figure in the third or fourth place

from the requirements as to specific gravity, though exceeding those requirements in germicidal power, are instances of a kind of meticulousity which has no place in so serious a business as the enforcement of the food and drugs act."

An editorial in the July Am. Druggist calls attention to rulings and interpretations that seem to be far-fetched and unreasonable. It states—"It is not the law; it is the man who administers it that counts, and unfortunately too many of the officials who interpret, administer and try to enforce our laws relating to foods and drugs are theorists, not practical men. The graduate from a college put in charge of a state laboratory may be able to detect one part of salicylic acid in a million parts of strawberry jam, but unless he knows that salicylic acid is a normal constituent of many berries he may cause expensive trouble by over zeal. It might be a good idea to require at least one year's practical experience in a manufacturing laboratory, canning or preserving plant, as a requisite for appointment as analytical chemist in the public service." The most scrupulous and painstaking manufacturer may suffer from the inattention or misdoing of his employees but he should not be subjected to the injustice of being advertised for variations from the standard which do not exist.

Reports of various boards show that there is still remarkable variation in the strength of simple products as supplied by the retailer.

Spirit of Peppermint	1% to 80%	of official strength.
Tinct. of Iodine	56% to 89%	" " "
Spirit of Anise	9% to 81%	" " "
Spirit of Camphor	55% to 75%	" " "

but these cases of variation are comparatively few in number compared to the total number of samples examined. In some states the character of the balances, weights and measures in common use in drug stores is very severely condemned, a serious number being found defective.

Many lots of Oil of Birch and Oil of Wintergreen have been condemned as mixtures of Methyl Salicylate and other distillates. New tests have been published which claim to give the presence of such sophistications. One of these tests is 5 drops of a five percent solution of vanillin, 5 drops of suspected oil and 2 cc. C. P. concentrated Sulphuric Acid. With Methyl Salicylate a very pale green color results; with Oil of Birch a blood red, and with Oil of Gaultheria a deep crimson red. Another form of the test adds 1 cc. of alcohol. The use of drops is a gross inaccuracy to start with and all color reactions are of no value unless the absence of other bodies that might give similar reactions is first determined. With the wide range of organic matter an unknown, unexpected or unfamiliar vegetable principle may vitiate the test.

To determine its value the test was applied using the following materials.

ONE A 5% alcoholic solution of Vanillin.

TWO A mixture of pure Methyl Salicylate 300 parts and Oil Cedar Wood 1 part. This mixture gives the optical rotation and responds to the other pharmacopœial tests for true oil of Wintergreen Leaf.

THREE Pure Methyl Salicylate.

FOUR Oil of Birch guaranteed to be strictly pure by a dealer who does not market Oil of Wintergreen Leaf.

FIVE Sample of Oil of Birch guaranteed by a dealer to be pure to his certain knowledge.

SIX Oil of Birch from a prominent manufacturing chemist.

SEVEN Oil of Birch from a distiller guaranteed absolutely pure.

EIGHT Oil of Birch from a distiller guaranteed absolutely pure.

NINE Oil of Birch from a dealer who has assured himself by observation and tests that it is absolutely pure.

TEN Methyl Salicylate 99 parts, Oil Cedar Wood 1 part.

ELEVEN Oil Gaultheria Leaf from dealer who guarantees it absolutely pure from investigation of its source and by chemical examination.

TWELVE Oil Gaultheria Leaf from a distiller.

THIRTEEN Oil Gaultheria Leaf from a distiller.

FOURTEEN Oil Gaultheria Leaf from a dealer who has assured himself of reliability of source and has had it carefully examined for purity.

In applying the test 3 minims each of the Vanillin reagent and the oils were mixed with 2 cc. of C. P. Sulphuric Acid and the color noted on mixing (Column A.) After 17 hours color was noted (Column B.) One cc. of alcohol was added and color noted (Column C.) After 24 hours color was noted (Column D.) A separate test was made by mixing 1 cc. of each product with one cc. of C. P. Sulphuric Acid not using any Vanillin reagent with the oils (Column E).

TABLE

	A	B	C	D	E
1	Pale green.	No change.	No change.	Dark green.	Deep red soon changing to olive green.
2	Pale cherry or dark amber.	Little darker.	Deep crimson like No. 14.	Deep crimson	Very pale straw.
3	Pale green.	No change.	No change.	Dark green.	No color.
4	Deep cherry red.	Much darker inclining to crimson.	Deep violet red	Violet.	Deep blood red.
5	Deep cherry red.	Little darker.	Darker red.	Deep red.	Amber.
6	Amber only.	Little darker.	Some darker.	Deep red.	Pale Amber.
7	Amber only.	Little darker.	No violet.	Deep red.	Dark Amber.
8	Amber only.	Little darker.	No violet.	Deep red.	Amber.
9	Between No. 4 & No. 6	Little darker.	No violet.	Violet red.	Very pale Amber.
10	Darker red than 3. 6. 7 or 8.	Little darker.	Violet crimson red.	Deep crimson.	Straw color.
11	Deep cherry red.	Little darker.	More crimson.	Deep violet blue.	Deep blood red.
12	Amber red.	Little darker.	More crimson.	Violet red.	Light blood red.
13	Dark amber red.	Little darker.	More crimson.	Violet red.	Light blood red.
14	Deep crimson red.	Little darker.	Violet red.	Violet blue	Blood red

By studying this table it will be seen that No. 4 and No. 5 Birch Oil gave the deep cherry red with "A" test but No. 4 became very much darker and with "E" test gave a deep blood red while No. 5 gave amber only.

The mixtures of Cedar Wood Oil and Methyl Salicylate gave a good test for pure oils with test "A" but an entirely different and characteristic reaction with test "E." All but two of the birch oils would be rejected by tests "A," "C" and "E" yet were all specifically guaranteed to be pure. Is it not probable that the oils in their color giving contents vary by different methods and the varying amount of care used in distillation? Is a color test that can be so easily modified by the addition of other substances to be depended upon?

After standing 36 hours the mixture of equal parts of the sample and C. P. Sulphuric Acid gave the following—

No. 2	Decided separation of Salicylic Acid.
No. 3	Greater " " " "
No. 4	Moderate " " " "
No. 5	Slight " " " "
No. 6	Decided " " " "
No. 7	" " " "
No. 8	" " " "
No. 9	No apparent " " " "
No. 10	Decided " " " "
No. 11	Small " " " "
No. 12	Decided " " " "
No. 13	" " " "
No. 14	Very little " " " "

Later on all gave a decided separation of Salicylic acid.

Martin I. Wilbert has accomplished a table reporting the examination of 10,524 samples, of which 3288 or 31.2% were rejected. He also presents an interesting table showing the wide variation in the active constituents of drugs.

	No. of samples	Minimum %	Maximum %
Belladonna leaves	144	0.175	0.563
Belladonna root	115	0.110	0.780
Guarana	41	3.720	5.160
Hydrastis	114	2.30	4.85
Hyoscyamus	120	0.043	0.234
Ipecac	253	1.240	2.750
Jalap	173	3.67	21.76
Stramonium	127	0.140	0.470

He also calls attention to deterioration caused by heat, by constituents of the air, by ferments, by micro-organisms and by combination with inorganic bodies.

Of 718 prescription balances examined in Kansas 195 were unfit for use, nearly one-half of the prescription weights were condemned. He states that tablets under most favorable conditions may vary from 10 to 30% from the quantities claimed.

In the Chemical Laboratory of the Am. Med. Association of 20 samples of 5 gr. Tablets of Potassium Iodide only two were below 94% of stated strength, one was 106.6% of stated strength, average 99.75%. Fl. Ext. of Goldenseal ranged in strength from 82% to 135% of official alkaloidal contents, while the declared alcohol contents varied from 40% to 66%. Nineteen samples of Morphine Sulphate T. T. $\frac{1}{4}$ gr. varied from 84.10% to 115.94% of stated strength, average 97.6%.

ACETANILIDE Tablets 5 gr. were 4.36 gr.

DEPT. AG.

ACETANILIDE COMP. Tablets contained 2.898 gr. Acetanilide instead of 3.5 gr. and 0.431 gr. of Caffeine Citrated instead of 0.5 gr.

DEPT. AG.

ACID CRESYLIC Varies considerably in color, solubility and in antiseptic value. Much of the commercial supply is below the U. S. P. standard.

W. L. SCOVILLE

ADEPS LANÆ Sometimes contains sulphur compounds in appreciable amounts. W. L. SCOVILLE

ALCOHOL Frequently 96% to 97% with objectionable amounts of non volatile matter. W. L. SCOVILLE

Of 98 samples 47 or 47.9% were rejected. M. I. WILBERT

ALOES One lot was free from Aloin. W. L. SCOVILLE

ALUM DRIED 5% insoluble in water. Contained trace of iron, 7% water, was not clean.

Lot 2, 3.5% water, 5.5% insol. in water.

Lot 3, 2% water, 3.5% insol. in water. E. L. PATCH

BEEF EXTRACT Varied from 7.4% to 17.88% salt. W. L. SCOVILLE

BELLADONNA LEAF 0.3, 0.35, 0.099, 0.235, 0.30. E. L. PATCH.

BENZOIN Six lots varied from 77% to 94% alcohol soluble matter.

W. L. SCOVILLE

BLACK HELLEBORE ROOT 15 lots Ash from 8.6% to 11.44%. Extractive from 22.3% to 31.6%. E. L. PATCH

BLOODROOT Five lots yield 4.1% to 6% ether soluble alkaloids.

W. L. SCOVILLE

BORAX Of 17 samples labeled variously "borated skin soap," "real borax soap," "borax soap powder," etc., eight were free from borax, while others ranged from traces to 10%. J. IND. ENG. CHEM.

CAFFEINE CITRATED TABLETS 2 gr. were less than 1 gr. DEPT. AG.

CALOMEL TABLETS 2 gr. were .93 gr. DEPT. AG.

CALOMEL & SODA T. T. 1 gr. Calomel were .62 grain.

CANNABIS INDICA East Indian 10.1% Ether soluble resin to 12.2%. American consisted of leaves only. E. L. PATCH

AM. CAN. IND. Tops contain 10% to 12% seeds and physically tests 80% of Bombay. SMITH, KLINE & FRENCH CO.

CHLOROFORM Some lots contained chlorine compounds and organic bodies which modified the odor and made it unfit for use. W. L. SCOVILLE

CINCHONA. RED 12 lots yielded from 7.21% to 11.63% total alkaloids.

W. L. SCOVILLE

COCHINEAL 10% ash including considerable magnetic iron oxide, Fe_3O_4 . Had 75% of normal coloring power. Lot 2 5% ash, 75% of normal coloring power. Gray. Ash 5%, coloring power 100%. E. L. PATCH

CRESOL

Sp. gr. 1.029, Not soluble in 60 parts of water.

Sp. gr. 1.038 Soluble in 90 parts of water insol. in 1 vol. 10% NaOH.

Sp. gr. Soluble in 90 parts of water insol in 1 vol. 10% NaOH.

Sp. gr. 1.028, Not soluble in 60 parts of water insol. in 1 vol. 10% NaOH.

Sp. gr. 1.029, Not soluble in 60 parts of water insol. in 1 vol. 10% NaOH.

Sp. gr. 1.036, Soluble in 60 parts of water soluble in 1 vol. 10% NaOH.

Sp. gr. 1.030, Not soluble in 60 parts of water not soluble in 1 vol. 10% NaOH.

Two out of six lots U. S. P.

E. L. PATCH

CUDBEAR Varies from 60% to 100% in coloring power.

E. L. PATCH

CUBEB Ran quite uniform the past year, yielding 18.1% to 22% oleoresin.

W. L. SCOVILLE

DAMIANA, PHOS. & NUX VOMICA TAB. 2-25 gr. Ext. Nux Vomica instead of $\frac{1}{4}$ gr. only a trace of phosphorus. DEPT. AG.

DERMATOL Contained 20% of sulphur.

GINGER ROOT Jamaica Ginger Ash 3.8%, Alc. Ext. 3.6% to 6.3%.

E. L. PATCH

GUAIAC RESIN Showed 67.5% to 92.8% soluble in alcohol. Four out of 8 lots were above 80% soluble. W. L. SCOVILLE

HYDROGEN PEROXIDE One lot contained arsenic in excess of 1 part in 100,000 and was deficient in strength. DEPT. AG.

HYOSCYAMUS Of 22 samples 2 were below 0.05%, two between 0.05% and 0.06%, six between 0.06 and 0.07%, five between 0.07% and 0.08%, three between 0.08% and 0.09%, two between 0.09% and 0.10% and two above 0.10%. W. L. SCOVILLE

INFUSORIAL EARTH Much of that in the market contains carbonate or soluble matters which render it objectionable as a clarifying agent, unless washed with a dilute acid. W. L. SCOVILLE

IODINE TINCTURE 15 samples varied from 56% to 89%. MASS. B. H.

Of 984 samples 474 or 48.1% were not up to standard. M. I. WILBERT

IPECAC One sample of Rio contained 1.58% alkaloids. W. L. SCOVILLE

Rio 1.837%, Ash 5%, 2.12% alkaloid. Carthagen 1.818%, Ash 5.2%, alkaloid 2.4%, 2.13%, 2.4%, 2.29%. E. L. PATCH

IRON IODIDE Syrup labeled 10% contained 4.6%. DEPT. AG.

Of 549 samples 88 or 16% were rejected. M. I. WILBERT

JALAP Total resin 6.05% Ether soluble 0.9%

" " 9.67% " " 1.07%

" " 3.57% " " 0.72%

" " 8% " " 1.1%

" " 7.2% " " 0.9%

E. L. PATCH

KOLA 1.4% to 2.24% alkaloid.

E. L. PATCH

One lot 1.6%.

W. L. SCOVILLE

LEAD CARBONATE Was a mixture of Barium Sulphate and Sulphide.

E. L. PATCH

LARKSPUR SEED 1.12% to 1.76% alkaloid.

E. L. PATCH

LUPULIN Is still in the market containing sand. One sample only 2.4% ash and three had 24%, 27.7% and 30.9% mineral matter respectively.

W. L. SCOVILLE

MACE Arillus of *Myristica malabarica*, false mace or Bombay Mace, worthless as a spice, used to adulterate and substitute the genuine mace, the dried arillus of *Myristica fragrans*.

DEPT. AG.

CASTOR OIL Sold containing 33% of Cottonseed Oil.

DEPT. AG.

OIL ANISE Lots answered all tests but that of optical rotation. They were guaranteed absolutely pure.

Opt. rotation + 0.4°

+ 0.4°

— 0.3°

+ 9.05°

Congealing point 6° C. (U. S. P. not below 15° C.)—1.0°

Congealing point 15° C. Sp. gr. 0.9796 —0.2°

Congealing point 15.5° C. Sp. gr. 0.9768 —0.2°

E. L. PATCH

OIL CLOVE Contained 15% of alcohol.

DEPT. AG.

OIL CORIANDER Contained 20% Oil Caraway.,

DEPT. AG.

OIL FENNEL Sp. gr. 0.9784 (U. S. P. 0.953 to 0.973) Congealing point 0° C. (U. S. P. not below 5° C.) N/D 1.5318 (22° C.) Opt. rotation + 14.5°. Was a Schimmel Oil guaranteed absolutely pure.

E. L. PATCH

OIL LAVENDER (Mottet's) consisted of a mixture of Oil of Lavender and Glycerin esters.

any santonine. BULL. SCI. PHARMACOL.

E. L. PATCH, Chairman of Com.

Memorandum:—In signing the report of the Committee on Quality of Medi-
cinal Products, I desire to make several comments on statements contained therein.

1. I think that the evidence adduced to show that "there is still a tendency to
allow the enforcement of the regulations to become one-sided and work serious

and uncalled for injustice," should be carefully investigated before being endorsed by the Committee or the Association. Such an investigation might show that the charges so recorded are based on *ex parte* statements, and are either without foundation or are seriously misrepresentative. Such unfounded charges are being systematically circulated, and in a way to appear sincere and truthful, thereby misleading the well-meaning. That the tendency above-quoted, exists, I am not denying, but I think that the greatest care should be taken in sifting specific charges, lest unjust conclusions should be drawn.

2. I think there must be some mistake about a Henbane that contained 0.234 percent of alkaloid. I think something else than the henbane must have been examined, probably Stramonium.

3. I think that something else than Belladonna leaf was examined when 0.099 percent of alkaloid was obtained, probably henbane. H. H. RUSBY.

Memorandum:—In signing this report I do not endorse the unverified charges made on pages one and two. The charges are rather serious and, if correct, should be verified by reference to publication or otherwise. Bald, general statements of this character can not be productive of good. I fully agree with the Chairman of the Committee that if anyone has been injured by error due to an inadvertence of the analyst, restitution to the fullest should be made. No manufacturer should be compelled to suffer loss of trade and be put to an expense as the cause of such error.

Respectfully,

L. F. KEBLER,

Chief, Drug Division, Bureau of Chemistry, U. S. Department
of Agriculture.

THE NEW SCIENCE OF IMMUNOLOGY.

F. E. STEWART, PH. G., M. D.

It is my purpose in this paper to call your attention to the new science of immunology on account of its rapidly growing importance to pharmacy. Biological products, as they are called, are products of immunization and they are used to produce artificial immunity for the prevention and cure of disease, and for diagnostic purposes. They are manufactured by the great pharmaceutical houses and also by physicians for their own use. They are already handled by the pharmacist, and as the new science of immunology develops, the demand for them will increase. Sooner or later, therefore, the science of immunology must occupy a more important place in relation to the educational work of the colleges of pharmacy, and text books must be written suitable for the use of pharmaceutical students.

Objections are strongly urged by some against teaching the science of immunology in colleges of pharmacy. It is said with some truth that the preliminary education of the pharmacist is not sufficient either in scope or character for him to comprehend it. Attention is called to the fact that the science of immunology deals with knowledge profound and complex, requiring a thorough medical education and post-graduate laboratory training for proficiency. The same objections might be as well urged against the teaching of chemistry in the pharmaceutical schools.

It is also objected that the practical application of the knowledge of immun-

ology pertains exclusively to physicians and bacteriologists, and has no place in the drug-store. On the contrary, a certain amount of knowledge of this science is requisite to proper living and every graduate of a high school should be instructed in the principles of this science.

The conception of contagion or the communication of disease from person to person by contact, direct or indirect, has been handed down from the times of Aristotle (384-322 B. C.) but it is only within recent years that the true nature of contagion has become known. Now we know that the infectious diseases are caused by bacteria, protozoa, yeasts and moulds. The pharmacist is being taught something about these organisms in his course in botany and bacteriology, but it seems to me that he ought to be taught also how infective agents grow and multiply in the body and produce the groups of symptoms known as infectious diseases. The pharmacist is taught by the pharmaceutical college to know that malaria is due to malarial germ carried by the mosquito and that quinine taken properly as a medicine will kill the malarial germ. Why should he not be taught that boils are due to staphylococcic infection, and that the injection of killed cultures of the staphylococcus into the patient's healthy tissues will stimulate the tissue cells to produce substances, which, taken into the circulation and carried to the diseased tissues, will aid in curing the boils?

It is common knowledge that immunity to subsequent attacks of the same disease is conferred by the first attack in relation to some of the infectious diseases, such for example as smallpox or typhoid fever. But how many pharmacists stop to consider how immunity is acquired by the attack of an infectious disease? It is quite generally known that persons subject to "common colds" seem to acquire a greater susceptibility as the result of an attack. Yet bacterins are used for the purpose of immunizing against "colds." How can a bacterin, consisting of a modified disease virus, produce immunity against an infectious disease like a "cold" or influenza, when no immunity can be acquired by an attack of the disease? This question is frequently asked by physicians and intelligent laymen. How can this seeming paradox be explained, or is the use of bacterins for immunization against "colds" a fake? It is also commonly known that immunity to certain infectious diseases may be acquired artificially by vaccination, but how many pharmacists know that vaccines are modified disease viruses or how immunity is produced by vaccination? Infectious diseases: what are they? Immunity: what is it? Unless the pharmacist can answer these questions satisfactorily to the intelligent laymen, he is in position to make himself ridiculous.

But you say the pharmacist is not supposed to be proficient in the knowledge of the uses of drugs. This knowledge is necessary to prescribing medicine, but prescribing is the province of the doctor. That is very true. Prescribing or applying medicine is the province of the doctor, because to prescribe properly, diagnosis is necessary. But no diagnosis is involved in answering questions as to the proper use of a drug. There is a long distance between the knowledge of drugs and their uses, and the knowledge of disease, diagnosis and treatment. Knowledge of drugs and their uses is constantly demanded of the pharmacist by the medical profession as well as by the general public, and in my opinion such

knowledge should be taught in the colleges of pharmacy, so that pharmacists may be able to answer questions asked of them by intelligent laymen and also frequently asked by physicians.

Moreover, the knowledge of immunology is now being popularized by our monthly magazines, weeklies and daily newspapers. The well-educated layman is often far better posted on the subject than either the ordinary physician or the pharmacist. And yet the pharmacist, as well as the physician, claims to be an expert in *materia medica*. Can the colleges of pharmacy afford to graduate their students without sufficient knowledge of this new science of immunology to enable their graduates to answer questions on the subject liable to be asked them at any time by the educated class of the community?

Most educators will admit that pharmacists ought to be taught how biological products are produced and how they should be carried in stock in such manner as to prevent their deterioration. Yet this knowledge is not sufficient to meet the requirements of the medical profession and the public. If pharmacists are to receive recognition as professional men, they must acquire sufficient knowledge to justify the classification of pharmacy among the learned professions. I am therefore bringing the subject before you for discussion. The following outline is suggested as suitable for use by colleges of pharmacy in teaching the new science of immunology.

OUTLINE SUGGESTED AS SUITABLE FOR USE BY COLLEGES OF PHARMACY IN TEACHING THE NEW SCIENCE OF IMMUNOLOGY.

- I. Introduction: General Remarks defining the new science of immunology.
- II. History of the Conception and Development of the Germ Theory of Infectious Diseases.
 1. Reference to the work and observations of Kircher in 1659, and Leeuwenhoek in 1675. *Animalcula*. *Microbes*.
 2. Statement of the germ theory by Plenciz in Vienna in 1762.
 3. Advancement of the knowledge of infection along the lines of fermentation. Observations and work of Robert Boyle (1627-91); Cagniard-Latour (1835); Schwann (1837); Helmholtz (1843). Pasteur's announcements in 1858, 1860, and 1863.
 4. Origin of Microbial Life. Doctrine of spontaneous generation overturned by Pasteur.
 5. First actual demonstration of the germ theory; discovery of the microbe origin of anthrax or splenic fever; Fuch's discovery of micro-organism in animals dead of anthrax, in 1848. Henle's postulates for testing the claims of discoverers. Pollender's discovery of rod-shaped bodies in the blood and spleen of animals dead of anthrax, about 1850. Davaine's demonstration that the disease can be transmitted by these germs.
 5. Modern conception that infectious diseases are groups of reactive symptoms produced by the resistance of the body cells to invading microbial cells, and that the process is one in which enzymes or digestive ferments, secreted by both combatants, play a most important part.
 7. Discovery of the germ of relapsing fever by Obermeir in 1868. Halt in the development of further knowledge in the field of bacteriology and immunology owing to the want of proper *technique*.

8. Introduction of technical methods of research by Koch in 1880, and new era in the development of bacteriology and immunology. Work and observations of Koch, Metchnikoff, Ehrlich, Eberth, Klebs, Behring, Roux, and many others.

9. Great work of Pasteur in developing the knowledge of infection, immunity, and vaccination, stimulated by discovery of smallpox vaccination by Jenner in 1798.

III. Infection and Immunity.

1. Infection and Immunity defined. Natural and acquired immunity. Active and passive immunity. Theories of immunity; Pasteur's Exhaustion Theory; Chauveau's Noxious Retention Theory; Metchnikoff's Phagocytosis Theory; Vaughan's Parenteral Digestion Theory; Theories of Besredka and Garbat and Meyer; Sajous' Internal Secretions Theory; Ehrlich's Side-chain theory.

2. The known infective agents—bacteria, protozoa, yeast and moulds. How infective agents grow and multiply in the body. Protoplasm and protoplasmic enzyme action. Phagocytosis or cell digestion. The doctrine of specificity. Constitution of enzymes. Function of amboceptor and complement. Parenteral digestion. Digestive power of blood serum.

3. How immunity is acquired through an attack of an infectious disease. Definition of term "infectious disease." Infectious diseases due to the growth and multiplication of infective agents in the body. Infective agents live on tissue proteins. The tissue proteins are digested and split up by the enzymes of the infective agents. Structure of the protein molecule; primary (poisonous) and secondary (non-poisonous) groups of atoms comprising the protein molecule. Protein sensitizers. Toxicity of infectious diseases and poisonous action of infective agents due to the poisonous group of the protein molecule. "Serum sickness and anaphylaxis."

4. Immune Serums and Antibodies. Antigens and antibodies defined. Antibodies found in immune serums; bactericidins, bacteriolysins, opsonins, agglutinins, precipitins. Amboceptor or substance sensibilisatrice; immune body. Complement, alexin or cytase. Teachings of various authors compared.

5. How active immunity may be artificially acquired.

(a) Active immunity acquired by immunizing with a living virus.

(b) Active immunity acquired by immunizing with a modified living virus; Vaccination. Smallpox vaccine. Rabies vaccine.

(c) Active immunity acquired by immunizing with killed bacteria; bacterial vaccines.

(d) Active immunity acquired by immunizing with sensitized bacteria; sensitized bacterial vaccines, senso-bacterins, sero-bacterins.

(e) Active immunity acquired by immunizing with bacterial extracts; agglutinations.

6. How passive immunity may be acquired.

Antitoxins and antibacterial serums.

IV. Vaccines, Bacterins, Antitoxins, Antibacterial Serums.

1. Preparation. Preparation of smallpox vaccine. Preparation of rabies vaccine. Preparation of bacterins (bacterial vaccines.) Preparation of sensitized bacterins (senso-bacterins.) Preparation of antitoxins and antibacterial serums.

V. Prophylactic Immunization against Infectious Diseases.

1. Active and passive immunization against typhoid fever; paratyphoid fever; influenza and "common colds;" pneumonia; pertussis or whooping-cough; scarlet

fever; Asiatic cholera; bubonic plague; cerebrospinal meningitis; tetanus; anthrax.

VI. Bacterin and Serum Therapy.

The aim of bacterin and serum therapy, the production of a condition of immunity for therapeutic purposes. What occurs in spontaneous recovery. Mechanism of Immunity. Bacterin and serum therapy depend upon the principles of active and passive immunization respectively.

Bacterin and serum therapy of diphtheria; tetanus; typhoid fever; pneumonia; broncho-pneumonia; influenza bronchitis and "common colds;" pertussis (whooping-cough); Asiatic cholera; plague; dysentery; tuberculosis; meningitis; staphylococcic infections, acne, carbuncle, furunculosis, sycosis; streptococcic infections, septicemia, erysipelas, puerperal fever, streptococcic sore throat, rheumatism and various complications; gonococcic infection, acute and chronic gonorrhoea, gonorrheal rheumatism, etc.

VII. The toxins of the Higher Plants and Animals and their antibodies. The phytotoxins, ricin, abrin, crotin. The zoötoxins, phrynolysin (toad poison), arachnolysin (spider poison), snake poison, scorpion poison, bee poison. Antiferments.

VIII. Chemotherapy; distinguished from pharmacotherapy by Ehrlich. Atoxyl, Salvarsan. Chemotherapy of malignant tumors.

IX. Diagnostic Tests and Reactions.

Tuberculin reactions; the subcutaneous reaction, cutaneous reaction, Moro's tuberculin ointment, Von Pirquet's cutaneous test, intradermal tuberculin test, the opthalgo reaction, the mallein test, agglutination tests, Abderhalden's test and various tests by other authors. The opsonic index.

GLYCERITE OF BISMUTH.

WILBUR L. SCOVILLE, PH. G.

The present formula for making Glycerite of Bismuth, N. F., is faulty in that a considerable loss of bismuth occurs in the process and the glycerite is therefore indefinite in strength.

No method for assay nor standard of strength is appended, and thus any product made according to the formula will be approved, but in the use of this glycerite for making elixir of bismuth and similar preparations there will be necessarily a variation in strength.

In preparing the bismuth and sodium tartrate, the subnitrate is first dissolved in nitric acid and water, the solution is diluted, then tartaric acid and sodium bicarbonate are added successively, which probably results in the formation of bismuthyl-sodium tartrate. Whatever the composition of this salt, it is soluble to a considerable extent in the strongly acid liquor, and is not wholly thrown out by further dilution.

Dr. E. H. Squibb has recommended to increase the dilution from 1000 Cc. of added water to 5000 Cc. This throws out the bismuth salt more completely,

but still results in considerable loss. Moreover this dilution is troublesome to handle and demands large containers and a large volume of purified water for the preparation of a relatively small amount of the glycerite.

The water used must either be distilled, which is costly, or a specially purified water which will not darken the salt or solution is needed. Furthermore it was found that the loss of bismuth occurs not only in the first washings, but in the last as well. If the present (1000 Cc.) amount of water be employed and three washings given, there will be a loss of about 5 to 7% of the bismuth and the final product will be strongly acid and not entirely soluble. The addition of sufficient sodium hydroxide to produce a neutral or faintly acid solution will bring all of the salt into solution, but on standing the salt will partially crystallize out. This is not due to supersaturation, for the separation will still take place after considerable dilution and the salt is soluble in alkaline liquids.

This method of procedure, which at first appeared quite satisfactory, proved to be anything but so on standing, and elixir of bismuth made with it, also gave trouble by separation of the bismuth compound.

Attempts were then made to recover all of the bismuth used by neutralizing the strongly acid liquor before washing. Since the tartaric acid and sodium bicarbonate are used in molecular proportions, a neutral solution should be obtained by simply neutralizing the free nitric acid present.

On trial, however, it was found that the bismuth precipitate is quite soluble in neutral solutions, and that while more of the salt was thrown out by the addition of alkali, yet it was impossible to entirely precipitate it by this method. While the liquid is still strongly acid, the salt begins to redissolve on the addition of alkali.

The amount of dilution is also a factor in the case. After a number of trials it was found that the addition of 64 gms. of sodium bicarbonate or of about 70 Cc. of concentrated water of ammonia, resulted in the least loss of bismuth. If the excess of alkali be added before dilution, the magma is more dense and washes more easily.

In these experiments the total mixture was made up to a volume of about 2000 Cc., which is about the same dilution as the present directions.

Further experiments were made to determine the relative advantages of ammonium tartrate and sodium and potassium tartrate (Rochelle salt) for securing a soluble salt. It was found that a soluble salt could be obtained by using Rochelle salt in place of sodium tartrate, but that relatively more of the former is required. Thus while theory requires 217 gm. of Rochelle salt, in place of 177 gm. of sodium tartrate, 300 gm. of Rochelle salt was required to produce a clear glycerite. This solution keeps well but has considerable color, and is not economical.

In a similar way ammonium tartrate was tried, and was found to be inferior to the sodium salt for the purpose.

The amounts of wash-water and the number of washings were also varied. It was found to be impracticable to wash the magma entirely free from acid, but the final acidity should not be strong. When the amount of wash-water and

the amounts decanted are uniform, five to six washings are ample. At the end the washings will be acid to litmus paper but not strongly so.

Some attention was also paid to the assay of this preparation. Attempts were first made to ignite it directly to bismuth oxide and sodium carbonate, then wash out the carbonate with hot water and weigh the oxide. This can be done, but the ignition must be made very slowly or the residue will deflagrate violently enough to throw practically the entire contents of the crucible out. This explosion usually comes without warning, and over a very low flame. A preliminary treatment with strong nitric acid tends to prevent it, but even then there is danger and the operation is slow, for digestion with the nitric acid must be continued for ten to fifteen hours before ignition can safely follow.

Furthermore the heat evolved in ignition from the action of the nitrate on the organic matter present, almost fuses the bismuth oxide and makes it very difficult to wash. In fact it cakes so hard that one never feels satisfied that it is thoroughly washed, and no way was found of avoiding the caking.

The sulphide method of estimating bismuth was found to be not only much more satisfactory, but shorter and easier to operate. By this method the glycerite is simply measured, diluted, saturated with hydrogen sulphide and the precipitate collected, washed, dried and weighed.

One point was settled in the series of experiments, namely, that crystallization in the glycerite does not occur primarily because of supersaturation. The solution is heavy in salts, probably containing nearly 400 gm. of tartrates in 1000 Cc., yet samples containing 110% of standard have stood nearly four months (present writing) without precipitation. Apparently the compound is easily thrown out of solution by other salts, or even by hydrolysis, but when in proper condition the solution is stable.

The following formula is recommended for this preparation:

GLYCERITUM BISMUTHI—GLYCERITE OF BISMUTH.

Bismuth Subnitrate	156 gm.
Nitric Acid	148 cc.
Tartaric Acid	232 gm.
Sodium Bicarbonate	325 gm.
Glycerin	
Distilled water each a sufficient quantity to make about 1000 Cc.	

Mix the nitric acid with 300 Cc. of distilled water, in a bottle having a capacity of about 4000 Cc. and dissolve the bismuth subnitrate in the mixture. Then slowly add 600 Cc. of distilled water and dissolve 116 gm. of tartaric acid in the mixture. Now add, in small portions, 195 gm. of sodium bicarbonate, shaking frequently and avoiding loss by effervescence. When all is added fill the bottle with distilled water and mix well. Allow the magma to settle and decant the clear liquid. Again fill the bottle with water and wash the magma by decantation as before, until the wash-liquor has but a slight saline taste. Then pour upon a filter and allow to drain, rinsing the bottle with a little water.

Now transfer the moist magma to a porcelain evaporating dish and add 116 gm. of tartaric acid, then slowly, and in small portions 130 gm. of sodium bicarbonate. Heat the mixture on a steam-bath until solution is effected and the total volume

is reduced to 475 Cc. Then add 475 Cc. of glycerin, if necessary, enough water to make 950 Cc. of solution, and filter. Estimate the amount of bismuth in the liquid by the process given below, and adjust it by evaporation or the addition of equal values of glycerin and water to contain the equivalent of 12.8 gms. of bismuth oxide in each 100 Cc.

A colorless or pale-yellow liquid having a slight odor of glycerin and a sweet, followed by a saline taste.

Specific gravity about 1.378 at 25° C.

If 5 Cc. of the glycerite, accurately measured, be diluted to about 200 Cc. with water, this solution saturated with hydrogen sulphide and allowed to stand two hours, then the precipitate collected on a tared filter, washed thoroughly with hydrogen-sulphide test solution, then with a little alcohol, and finally with recently distilled carbon disulphide until all free sulphur is removed, then dried to constant weight at 100° C., the residue should weigh not less than 0.690 gm.

(The weight obtained multiplied by 0.905 and this product by 20 gives the equivalent of bismuth oxide per 100 Cc.)

CONFERENCE.

Section on Pharmacopoeias and Formularies

Papers Presented at the Sixty-Second Annual Convention

CHAIRMAN'S ADDRESS—SECTION ON PHARMACOPOEIAS AND FORMULARIES.

E. FULLERTON COOK, P. D.

As this address is being written your Chairman faces the peculiar position of not knowing whether he is to deliver a call for renewed activity to a virile and promising branch of the Association, or whether he is to be called upon to preside at the obsequies of a dead or dying Section. Today the life of the Section hangs in the balance; before the Council, prosecution and defense have presented their cases and the verdict is awaited.

The Chairman has earnestly protested against the discontinuance of the Section, as he believes that it is an advantage to the Association to retain the divisions of work already established, increasing them perhaps, if necessary, so that the annual meeting will include adequate consideration of every important branch of pharmaceutical activity.

Instead of arbitrarily selecting three or four general heads as "Scientific," "Practical Pharmacy," etc., with the hope that the Chairman entrusted with the preparation of programs will cover all departments within the scope of pharmacy, it would seem to be a better plan to divide the same time between two or three Chairmen, each selected for his knowledge and interest in a specific branch of the work. Can it be expected that a chemist as Chairman would develop a program covering the latest developments in *Materia Medica* and Pharmacognosy, or a pharmacognist be interested in galenical preparations or prescription difficulties? Yet this is what has been seriously advocated.

Those familiar with the history of the Section know that it was proposed by the late Professor Oldberg whose large experience gave him the comprehensive vision which recognized the value of assembling pharmacopœial and formulary material, and developing year by year special programs covering this field. The Section was created by resolution of Council in 1912 and has officially enjoyed two years of life, a preliminary meeting having also been held during the Denver meeting three years ago. Whether the motion to abolish the Section has prevailed in the Council will probably be known by the time this Section meets and congratulations or condolences will be in order.

Whatever the decision, however, the importance of guide and reference books of the character here under consideration will not be lessened. So long as pharmacy exists a standard collection of formulas with tests and other related information for medicinal or prophylactic use, will remain an essential, so that, even in the midst of these uncertainties, a few guiding principles may well be laid down.

One task before the Section is the listing of the best available books containing formulas. This has already been started; a list mainly of foreign books having been presented a year ago by Mr. Raubenheimer and published in the Journal. The Secretary this year promised a more comprehensive collection of titles.

It would be of much value if this list when published would include a brief outline of each book, indicating its scope and purpose, price and publisher, and it should include, in addition to pharmaceutical preparations as usually understood, veterinary medicines, household recipes, business and scientific formulas, etc.

This field may also be enlarged (when the Association establishes permanent headquarters) through the Section's assistance in collecting the actual books, either by exchange for our National Formulary, or through donation or purchase. In this way a valuable collection of pharmacopœias and formularies will be made available for the officers of the Association and others. There has evidently been no attempt in the past to start such a collection, and your Chairman would suggest that, in anticipation of the establishment of headquarters, the proper parties be instructed to enter into correspondence with authors or publishers of such books, with a view of effecting an exchange with the new N. F. IV.

The main purpose of this Section lies in its possibility for constructive work. Its activities throughout a period of years should materially assist in the improvement of existing books and in the development of many new formulas and processes. The Section may encourage the improvement of existing standard formulas, the proposal of new or improved tests and assays for establishing the standard character of preparations, and the perfecting of new preparations useful in the field mentioned.

Before this Section, have been presented the reports from all established committees at work in associated fields—Pharmacopœia, National Formulary, Unofficial Standards, Recipes for Household or Scientific Use, etc., and the value of collecting these allied subjects before one interested audience and of affording an opportunity for discussion must be recognized.

Our own publication, the National Formulary, with the Fourth Edition enters upon a new era. For the first time it has been revised with the purpose in view of serving as a standard under the Food and Drugs Act. Standards have been established for such preparations as lend themselves to assay, and all articles entering the formulas have been carefully defined, if not already standardized by the U. S. P.

Although a privately owned book, it now becomes a part of the National Law, and it will require much wisdom on the part of the Committee in charge, and of the Association Council to establish the policies which are to control it.

The importance of the National Formulary has also greatly increased because of the inclusion in this edition of many largely used preparations formerly official in the U. S. P. The Association has assumed the authority of republishing these formulas, but it cannot claim thereby any exclusive control over them. This fact compels a broad and liberal attitude toward this question.

With the increased importance of the National Formulary another policy should become well-defined, i. e., the exclusion of any formula which can be said to imitate a proprietary or widely-advertised product. When years of medical

use have proven the efficacy of a certain type of preparation, and many pharmaceutical houses and retail pharmacists are manufacturing products of that type, there can be no fair criticism of the National Formulary if it publishes a formula of the same general character for the purpose of establishing a standard strength. The guiding principle here, however, should be "A high grade pharmaceutical product, offered upon its own merit and with a distinctive flavor and appearance."

Your Chairman would recommend that this Section go on record as approving such a policy for the Association in the preparations of the National Formulary.

The question has many times been asked "What sharp distinction now exists between the U. S. P. and N. F. " With the new policy for the N. F. IV in which basic substances used in formulas are included and standardized there is even less difference between the two books to the casual observer. There remains, however, this important difference: To the U. S. P. is conceded the right to first choose from the entire field of materia medica those substances or preparations, in the eligible class, which, in the opinion of the Revision Committee are most useful in the practice of medicine. The chief purpose of the N. F. from its inception has been to provide standard formulas for those substances used in medicine which the U. S. P. thought it unwise to include. Even this classification is too broad, for there are many substances and preparations used in medicine which will not be found in either the U. S. P. or N. F., so that in reality the N. F. is the second selection. As to the relative merits of many of the articles left for the N. F. there is a vast difference of opinion and often it has been by but a small majority that the decision was reached to include or exclude preparations from both books. This, of course, may be expected since medicine yet depends largely upon empiricism for its conclusions concerning the merit or demerit of many products, and this very condition demands a book occupying the place now held by the N. F.

Every member of the Association should do his utmost to perfect this important publication so that the Association may occupy an honorable and helpful place in the advancement of medicine during this era. As much as is possible the question of financial return to the Association from the sale of the book should be subordinated, especially if it is suggested that this income be used for the general work. The Association can hope to retain the honorable, but unusual position of control and ownership of a National standard only so long as the policies guiding the Association are free from pure commercialism; it must prove that it is worthy of the trust. A portion of the income from the sale of the book should be used for the establishment of a laboratory where, before the next edition is needed, some of the problems which have arisen during the current Revision may be solved. This would be a worthy and suitable use for a portion of the profits, and it should not be forgotten that at least the expense of adequate Revision should be provided for.

One feature of the sessions this year which should prove interesting to the members of the Association, and which should be helpful to both the U. S. P. and N. F. Revision Committees is the exhibit to be held on Friday. A number of the members of the Association have prepared specimens of new or modified

formulas using the proposed methods, and they have reported their experience with each preparation.

Your Chairman desires to express his appreciation of the immediate response given to his appeal for assistance in getting up this Exhibit, and takes this opportunity of thanking all of those who have contributed.

REPORT OF THE COMMITTEE ON THE U. S. PHARMACOPOEIA.*

The publication of four parts of the first proof of the U. S. P. IX has given this committee some material for consideration during the past year. The strenuous efforts, however, of the National Committee of Revision of the U. S. P., and of the committee on the National Formulary to complete their respective works has continued to absorb to a considerable extent the available energy of the majority of the members of this committee. We have, however, managed to review the first three parts of this first proof, and have forwarded as rapidly as possible the results of our deliberations direct to the Chairman of the Committee of Revision. We have hoped in this way to place our suggestions before the National Committee, at a time when they would be in a position to consider them.

A few of the comments that this committee has made which have a general bearing, we desire to present at this time in our report.

The use of the term "Melting Point," which is generally understood to mean a definite temperature, is inappropriate when used to designate a range of melting points for a given substance which may extend over several degrees of temperature.

The word "should" is not emphatic enough for use in expressing a requirement, and its use in this sense in the Pharmacopœia ought to be greatly curtailed.

Since the U. S. P. is a legal standard the plea has been made that its language be as free as possible from relative qualifying words of the character of "faint," "slight," "moderate," "about," etc., unless the same be properly defined in an appropriate place.

When an article of different origins is considered it is undesirable to place the different descriptions under one title, as is offered in the case of Salicylic and Benzoin, etc.

The use of the term "absolute Alcohol" to indicate an alcohol which is absolute, in one part, and not absolute in another part of the book, is confusing.

It seems highly desirable that the tests in the U. S. P. be discriminated into "identity or description tests" and "purity requirements."

With reference to standards, there seems to be a desire on the part of those who use the U. S. P. simply as a legal standard to set the purity requirements high and to have the tests very exacting, whereas those who may be amenable to its provisions seem to advocate a somewhat lower purity requirement with tests less exacting. To harmonize these two interests is undoubtedly a difficult matter. One also notes the desire of the Chemist to introduce special testing apparatus like the polariscope, spectroscope, refractometer, platinum ware, etc. On the other hand the druggist does not see his way clear to acquire these, even though he may have the time and ability to use them. Consideration should therefore be had for him in this effort to secure proper standardizations. Where no method of preparation is given for an article, refined methods of valuation would seem desirable; but in the case of the various preparations which may be

* Presented to Section on Pharmacopœias and Formularies, August, 1914.

made by the druggist, methods of standardization which demand only inexpensive apparatus should suffice.

This committee does not feel that the specific comments that it has made on individual drugs that have been mentioned in the pages of the first proof are of sufficient moment to the Association at this time to warrant burdening it or the pages of the Journal with them, since no one but the members of the Revision Committee can have any special interest in them.

Let it suffice to say that the members of this committee have made such criticisms and rendered such assistance as they could during the past year to aid the Revision Committee in their work of preparing a Pharmacopœia that will be acceptable to the members of this Association and to American pharmacists in general.

Respectfully submitted.

L. D. HAVENHILL, Chairman.

REPORT OF THE COMMITTEE ON RECIPE BOOK.

With Special Reference to its Scope and Indirect Value.

To Officers and Members American Pharmaceutical Association:

The Chairman of this Committee, through the courtesy of his colleagues, but not necessarily with their approval, is allowed to present his conclusions regarding the publication of a recipe-book by the American Pharmaceutical Association, independently, and, in the same manner, offer arguments supporting these conclusions.

There is so much more involved or intended to be involved in this recipe-book proposal than is yet generally recognized and appreciated that it seems not at all out of place to call attention, special attention, to related subjects and ask careful study of the far-reaching vital results that may be made to follow a proper working out of the relationship a recipe-book may bear to the other work and the other publications of the Association.

Fundamentally, the publications of an organized body, carrying such stupendous responsibilities as does the American Pharmaceutical Association, are important far beyond usual comprehension. One may justly tremble for those who have assumed principal responsibility for these publications, no matter whether the assumption be stimulated by creditable benevolence or sordid ambition. What is there, that is tangible, of the Association's yesterday's, but its publications? How is it possible to broaden the scope of its influences beyond that represented by the very limited number who attend its meetings save through or by its publications? What real thing is left to those who will follow us, but its publications? How does the world come to know of it; how does the world estimate its value; how is the world's respect created or its contempt engendered?—Wholly by its publications. Pharmacy and pharmacists of the United States of America, —and all and everything comprehended in these terms; the aims, the ambitions, the attainments, the standards, the science, even the morals of all these are most conspicuously and positively set forth in the publications of this Association. Let us be impressed by the truths:— "It is not that which entereth the man that defileth him, but that which proceedeth therefrom" and "By your fruits shall ye be judged."

And, fundamentally, again, must be considered the influence of the American Pharmaceutical Association, direct and indirect, upon other publications, notably, upon the Pharmacopœia and the pharmaceutical text-books. It is well for us to remember how much all of us laymen, as well as teachers, have to do with what is taught those who are to have future pharmacy's control. Why should we

wonder that such slow progress has been made when we fail to give those who must be our successors not the best that we know, but that which appears to be the most expedient for ourselves. God help us.

Parenthetically, it may be added that the influence of the American Pharmaceutical Association upon the revision of the Pharmacopœia is much more potent than is generally recognized and must not be overlooked or denied when the faults of *that* publication are exposed or its praises sung. If there is not soon to be a readjustment of the titles of our books of standards, even greater responsibilities might be thought of for this Association, in connection with the further proper development of the Pharmacopœia. It is really remarkable how comparatively little there is wrong with the general character of the eighth revision. The deletion of a very few inconsistent contents would make it almost perfect, save for its great want of comprehensiveness regarding much used simple substances. Let us congratulate ourselves and be happy over the most creditable progress made, but let us, also, as happily engage in making still further desirable progress.

Names may or may not have influence or power; this is an old question that is not, just now, up for settlement. For the moment, however, the titles of certain legally recognized books and their present characteristics may be wholly forgotten and the imagination allowed to form pictures without hindrance; such pictures are:— First. A thoroughly comprehensive book of standards for simple substances that are, in any way, used for the healing of the ills of human and other animal bodies,—nothing beside, nothing less. The proposed governmental list of general standards is held in mind, but careful consideration will lead to the opinion that there is a fortunate and unusual benevolence always surrounding the “healing of the sick,” which will lend additional interest and carefulness to the preparation of a book of standards for medicinal substances, alone. The differentiation of a simple substance may be made by describing it as something held together by the forces of cohesion or chemical affinity, separately or connectively. The creation and oft correction of such a book of standards should be entrusted to those who are trained to know, and do know, most about the identity and contained characteristics of drugs—the pharmacist.

Bearing directly upon the proper scope of the Association's existing publications, indirectly upon the proper status of the recipe-book and largely upon the prophetic comprehensive book of standards, is the excellent and creditably unselfish work done by our Committee on Unofficial Standards. Whoever it was, Dr. Kremmers or Dr. Beal that initiated this work, the real originator should be ascertained. He builded far beyond our early contemplation of the subject. It is, no doubt, the very satisfactory beginning of such a book of standards as is most needed by those that have to do with medicines and, if the work is properly husbanded and encouraged, it will surely lead to an authority to which the Pharmacopœia will be second, if the latter continues the impossible feat of riding two horses and of carrying such a diversity of burdens.

Surely, the work of the Committee on Unofficial Standards should be published in an independent volume and should not, for many good reasons, be included in a book of formulas. The Recipe-book, if published, will also make certain need for these standards. The importance and helpfulness of this fixing of marks of identity and signs of quality is far in advance of the mere constructions of formulas.

Second. An intelligent and carefully prepared list of therapeutic agents. Such a list should include the application of all the scientific knowledge at command and, while it could not be mandatory upon the medical profession, would help the trusting helpless and be an essential guide to teachers and board examiners. With this the pharmacist should have nothing to do and the medical profession should, through its greatest organization, have all to do. Whether or not this publication should contain more than simples, as heretofore described,

may be a subject for consideration by its compilers. Well defined outlines of this picture may already be seen in "Useful Drugs" of the Americal Medical Association.

Third. A book in which is contained formulas for preparations of the agents listed in "Number Two," the book of therapeutic standards, in such form and combinations as conform to the best knowledge and practice of the times and, certainly, with regard for reasonable ethics and the just rights of others wherever and wherever they may be. Such a book should be indicative of the character and attainments of the profession or professions it presumes to represent and should lend the helpfulness of advanced science. It should not, under any circumstances, present the fallacies of past ages or the mistakes of later days. The care and control of such a publication should, undoubtedly, in justice to all concerned,—invalid humanity, medicine, pharmacy,—be delegated to representatives of the two professions most intimately involved.

Fourth. A storehouse, repository, a resting place; in some respects, a museum to care for and hold for use, for reference, certainly, for preservation, all the medical formulas that are worth while, that have no place in authorized books of formulas. No formula should be included that has not been in more or less general use for five years and its genuineness and trustworthiness, as to identity, should be assured. When once admitted, it becomes the authoritative formula for the preparation under the name of which it is written, being, thus, a guide for all concerned.

It must be borne well in mind by all those who would enlarge the scope of the Recipe-book, that new formulas are generously gathered from all sources by the able reporter on the Progress of Pharmacy and are printed in the Year Book with such connected information as to make experimentation with them more successful. This yearly comprehensive collection of suggested formulas and suggested modifications of formulas is a most valuable feature of the Association's publications and does not need to be replaced by any other device. To the contrary, it should be encouraged and more earnestly exploited, for there is, indeed, much helpful information of this kind always stored in the Year Book. Let us hope for even a greater collection of offered formulas useful to the practical pharmacist.

All formulas introduced into the repository of accepted recipes should be prefaced with a concise history, giving the source, local connections and former placement, if any. Other offerings for the same title may be subsequently introduced, but always with explanatory notes of contest and with the names and arguments of contestants. Modifications of formulas may be accepted, but these must never lead to the slightest change of the original; they must be exhibited as modified recipes, with explanatory notes showing the reason for the modification and its author.

The source of these recipes should be as follows: (a) Deletions from the Pharmacopœias, including the revision of 1870, and those from all subsequent revisions; deletions from all the editions of the National Formulary, also the originals of the formulas remaining, in subsequent editions of those books, when the revised formulas show marked changes in strength or structure. (b) Popular formulas published in recognized medical and pharmaceutical authorities. (c) Selections from medical and pharmaceutical journals. (d) Foreign formulas largely used in this country. (e) Private contributions.

Concise a few specific recommendations are offered.

RECOMMENDATIONS.

It is recommended to the Association, as a whole, the recommendations to be referred for consideration, as may be the Association's pleasure, as follows:

First. That a permanent committee on Recipe Book be provided for, com-

posed of seven members, appointed by the Council, and that vacancies be filled by that body.

Second. That the Committee be authorized to collect recipes according to such rules as it may adopt, provided such rules are endorsed by the Council, it being understood that amendments to these rules shall also be endorsed by the Council.

Third. That as soon after the publication of the ninth revision of the Pharmacopœia and the fourth edition of the National Formulary, as practicable, the Committee's collections of recipes shall be published as a separate supplement to an issue of *THE JOURNAL* and a copy be furnished to each member of the Association with the issue of *THE JOURNAL* to which it may be a supplement.

Fourth. That the matter of publishing the recipes thereafter in book form be referred to the Council with power to act.

Attached hereunto will be found the suggestions as to "Scope and Character" of the Recipe Book, as made by Chairman Raubenheimer in the painstaking and able report read by him at the Boston meeting and as mere suggestions to the successors of this Committee, there will be also attached several lists of formulas giving their titles only, with source from which they may be obtained, all of which are most respectfully submitted as a part of this report.

In conclusion, the matter of this report should not be subjected to superficial criticism; it relates to matters of far too serious import to be so treated: it sets forth conclusions built upon years and years of hard and careful study, aided by close experiences, in the work, and by unusual opportunities for observation. The arguments should have full force; that they may be connected with personal eccentricities should not detract, in the least, from their real worth, nor should anything submitted in this report be opposed by mere personal whims. The fetish clinging to names by prejudiced conservatism or erroneous usage should be forgotten; the thing, itself, must be considered, its truth or its error, its progress or its "standpatism"; most of all must be considered its promises, its promises of better things, especially, to those for whom we should make clear the way.

From Report of Committee on Recipe Book at the Boston Meeting, Otto Raubenheimer, Chairman:—

"SCOPE AND CHARACTER."

"The Recipe Book should be progressive and helpful and should include formulas for things which are used and useful and should be divided into several parts.

a.—formulas deleted from U. S. P. and N. F.

b.—Formulas of foreign pharmacopœias and formularies, which are often prescribed or for which the retail pharmacist could make propaganda efforts.

c.—Various other formulas, often named after their originators, scattered, at present, in pharmaceutical and medical journals, books and proceedings and also hospital formularies.

d.—Toilet articles, cosmetics, and perfumery.

e.—Technical receipts as battery fluids, photographic solutions, cleansing fluids, insecticides, etc.

f.—Agricultural preparations, veterinary remedies, poultry foods and medicines, etc.

g.—Soda water, beverages, syrups, etc."

Formulas selected from those suggested by Chairman Raubenheimer, which are of a character to demand convenient placement and which would add real value to the Recipe Book:

Kummerfeld's Lotion
Hufeland's Infant Powder
Scarlet Red Ointments

Beck's Bismuth Pastes
Lubricating Jellies
Thiersch's Gauze

Lassar's Paste	"Clondy" Ammonia
(N. Y. S. & C. Hosp. Modification)	White Lotion
Compound White Lotion	Calamine Lotions
Granville's Lotions	

List of articles, the formulas of which the Chairman suggests, might, with great advantage, be taken out of the National Formulary and preserved in the Recipe Book:

Aromatic Vinegar	Sedative Water
Traumatic Balsam	Compound Camphor Cerate
Blackberry Cordial	Compound Decoction of Aloes
Compound Elixir of Celery	Elixir of Buchu
Compound Elixir of Buchu	Elixir of Buchu and Potassium Acetate
Compound Cathartic Elixir	Compound Elixir of Chloroform
Elixir of Coca	Compound Elixir of Corydalis
Elixir of Coca and Guarana	Compound Digestive Elixir
Glycerinated Elixir of Gentian	Elixir of Malt and Iron
Elixir of Pot. Acet. and Juniper	Compound Elixir of Blackberry
Brown Plaster	Compound Elixir of Stillingia
Compound Elixir of Viburnum Opulus	Essence of Pepsin
Compound Tar Plaster	Ferrated Extract of Apples
Compound Fluidextract of Buchu	Glycerite of Guaiac
Phosphatic Emulsion	Fermented Milk
Compound Liniment of Opium	Humanized Milk
Germicide	Alkaline Antiseptic
Battery Fluid	Solution of Morphine Citrate
Magendie's Solution of Morphine	Acid Solution of Phosphates
Solution of Pot. Arsen. and Bromide	Pearson's Solution
Solution of Chlorinated Potassa	Astringent Lotion
Black Wash	Lotion of Lead and Opium
Yellow Wash	Mixture of Acacia
Villate's Solution	Mixture of Ammonium Chloride
Hope's Mixture	Parrish's Camphor Mixture
Dalby's Carminative	Chloral and Bromide Compound
Chloroform Anodyne	Sun Mixture
Squibb's Diarrhoea Mixture	Lafayette Mixture
Loomis' Diarrhoea Mixture	Chapman's Mixture
Thielman's Diarrhoea Mixture	Mixture of Guaiac
Velpeau's Diarrhoea Mixture	Oleo-balsamic Mixture
Mixture of Oil of Tar	Stokes' Expectorant
Compound Mixture of Rhubarb	Gadberry's Mixture
Haller's Acid Elixir	Aromatic Pepsin
Antidyspeptic Pills	Barker's Post Partum Pills
Antineuralgie Pills	Francis Triplex Pill
Warburg's Pills	Compound Powder of Acacia
Hiera Picra	Catarrh Power
Soluble Antiseptic Powder	Compound Powder of Catechu
Aromatic Powder of Chalk	Calomel and Jalap
Compound Powder of Iodoform	London Paste
Compound Powder of Kino	Emollient Species
St. Germain's Tea	Breast Tea
Spirit of Ants	Alcoholic Eye Wash
Compressed Sponge	Bleached Sponge
Lime Juice and Pepsin	Compound Syrup of Cimicifuga
Syrup of the Bromides	Compound Syrup of Canada Snake Root
Syrup of Morphine Sulphate	Compound Syrup of Morphine

Syrup of Poppy
Compound Syrup of White Pine
Aromatic Syrup of Blackberry
Fenner's Guaiac Mixture
Hot Drops
Tincture of Ferrated Extract of Apples
Churchill's Tincture of Iodine
Tincture of Poppy
Compound Tincture of Zedoary
Mother's Salve
Soothing Ointment
Compound Fluidextract of Stillingia

Jackson's Pectoral Syrup
Neutralizing Cordial
Fleming's Tincture of Aconite
Warburg's Tincture
Bestucheff's Tincture
Deweese's Tincture of Guaiac
Compound Tincture of Kino
Bateman's Pectoral Drops
Turner's Cerate
Compound Tar Ointment
Hebra's Itch Ointment

To these must be added the one hundred and thirteen formulas in the "Appendix," which are deletions from the pharmacopœias.

The Pharmacopœia of the United States holds formulas, which the Chairman believes detract from its usefulness by lessening the respect in which it is held.

These formulas would *adorn* the Recipe Book; the list is as follows:

Vinegar of Opium
Cerate of Lead Subacetate
Confection of Senna
Emul. of Cod Liver Oil with Hypophos.
Compound Infusion of Senna
Antiseptic Solution
Mixture of Rhubarb and Soda
Mucilage of Elm Bark
Vegetable Cathartic Pills
Pills of Podo. Bella. and Capsicum
Compound Licorice Powder
Compound Jalap Powder
Aromatic Spirit of Ammonia
Syrup of Lime
Compound Syrup of Squill
Compound Tincture of Benzoin
Compound Tincture of Lavender
Aromatic Tincture of Rhubarb
Troches of Ammonium Chloride
Troches of Gambir
Troches of Krameria
Troches of Santonin
Wine of Antimony
Wine of Colchicum Seed
Wine of Iron
Wine of Ipecac

Hamamelis Water
Compound Rosin Cerate
Emulsion of Cod Liver Oil
Emul. of Oil of Turpentine
Turpentine Liniment
Chalk Mixture
Mucilage of Sassafras Pith
Compound Cathartic Pills
Compound Laxative Pills
Compound Pills of Rhubarb
Dover's Powder
Tully's Powder
Compound Spirit of Juniper
Compound Syrup of Sarsaparilla
Tincture of Aloes and Myrrh
Liquid Dover's Powder
Paregoric
Troches of Tannic Acid
Troches of Cubeb
Troches of Glycyrrhiza and Opium
Troches of Potassium Chlorate
Troches of Sod. Bicarbonate
Wine of Coca
Wine of Ergot
Bitter Wine of Iron
Wine of Opium

From the Unofficial Formulas, published by the Maryland College of Pharmacy:

Chlorodyne
Guttæ Vitæ
Buckler's Croup Mixture
Ungentum Hebra
Crazeaux Nipple Ointment
Nutritive Ointment
Zoll's Pink Paste
Clapp's Pills
Pill Triplex

Zoll's Comp. Confection
Buckler's Neuralgia Liniment
Grahame's Diarrhœa Mixture
Compound Camphor Ointment
Compound Galbanum Ointment

Section on Practical Pharmacy and Dispensing

Papers Presented at the Sixty-Second Annual Convention

CHAIRMAN'S ADDRESS.

FERDINAND W. NITARDY, PH. C.

Fellow Members:

This section was founded to give the pharmacist a clearing house, for the exchange of practical hints and information about dispensing, and the practice of real pharmacy, as well as to provide an institution to aid and foster initiative and advancement. The record of our proceedings should form an accurate history of the progress of practical pharmacy and dispensing within these United States, and the papers presented at these meetings should throw a vivid light on the practical application of scientific pharmaceutical advancement of the year, reflecting a credit to American pharmacy second to none.

Excellent work has been done by this section since its very beginning, work of a quality that has served as an inspiration to your officers, and work that we hope to equal this year. The scope and usefulness of this section, however, is such that, up to the present, I believe we have but barely scratched the surface of our possibilities. Officers have labored under great handicaps, and the general support of the membership is still to be enlisted. Gradually these handicaps should be eliminated, and each year should add to the number of actively interested members, until by growth and development, the section will reach the zenith of service and usefulness to American pharmacy.

I did not fully realize the inadequateness of my experience, when you honored me with this important office, or I should have been more reluctant about assuming it and the duties involved. I am mentioning this with a definite purpose, for I believe that all previous officers have felt, to a greater or less extent, the lack of experience in conducting work of this nature. I also believe that something can be done to help overcome, in part at least, this handicap, and it is for this reason that I am devoting a portion of my address to the work of the section direct, embodying a few questions that I hope may receive your earnest consideration.

Guided by the experience obtained in a year's effort on behalf of our section, I am led to believe that one of the greatest handicaps to the officers lies in the absence of all records pertaining to the work done by their predecessors. Each year we have succeeded in collecting a number of valuable and instructive papers, most of them written by what we might call the old guard; small indeed is the quantity of new blood enlisted. Either there exists a shameful apathy on part of the rank and file of our members, or we officers are on the wrong track in our efforts to enlist their interest and coöperation. Would the preservation of our correspondence, mailing lists, etc., help future officers in selecting the names of members to whom to address their appeal for papers? Would a record of how and what, was done, with a notation of the results obtained, serve as a useful comparison or prove of value in determining how the duties of the officers may be executed with the greatest efficiency and economy? Could we in course of a few years by following a definite system, make an effective appeal to the entire membership and enlist the coöperation of all who are interested in practical pharmacy and dispensing? Could the final results of such appeals be tabulated or reduced to a card-index system, that would eliminate guesswork and un-

necessary expense and labor? Would it be advisable to formulate at each convention a set of questions, embodying such problems as confront practical pharmacy and dispensing, for study and solution during the year, the results or answers to be offered at the following year's meetings? Could a systematic research of practical pharmacy be carried on by this section, if we should formulate definite plans, divide and assign the work to such members as have expressed their willingness to aid, and compile the results for publication or presentation at our conventions? Would a carefully planned progressive campaign, endeavoring to solve the problems and questions confronting us, spell greater progress and interest for the section than our present method of leaving all the subjects of our papers and discussions entirely to chance? I believe I should answer these questions in the affirmative; further I believe the section can accomplish these and greater things in course of time if we shall lay the proper foundations and plan our work ahead like an architect plans a building previous to its construction.

I would like to have you discuss these questions briefly, and I should especially like to hear the opinions of the ex-chairmen and past officers of the section. Even tho it may be considered premature to take definite action this year, I feel that such a discussion will bring out many valuable suggestions, which, as part of our minutes can be referred to by future officers, with profit as well as give additional material for study previous to final action.

The interests of this section are the interests of the practical pharmacist and dispenser, and as such is true, I feel it may not be amiss to touch on some of the influences shaping his destiny.

Pharmacy is undergoing decided evolutionary processes. Considerable attention has been paid to the trend of commercialism, but the influences that are now changing the professional side of our vocation have been but meagerly discussed. Hygiene, preventive medicine, serum therapy, vaccine treatment and other modern methods are reducing the present physicians' legitimate demand for drugs. Prescription business is not increasing. Dispensing doctors, the "hand me down" type of prescriptions supplied by manufacturing houses in the form of ethical (?) proprietaries, Christian Science, medical fads, the public's love for self-treatment with patent nostrums, and our own inclination to let the manufacturer do the bulk of our work along producing lines, leave little real professional work for the pharmacist. We must carefully conserve the remnant and find new fields of professional endeavor, or professional pharmacy will gradually pass out of existence. By proper attention to the actual practice of pharmacy, much can be done to revive and maintain a demand for such professional service as is involved in the dispensing of prescriptions. Making our own preparations, educating the doctor to specify U. S. P. and N. F. and seeing that, when these standard preparations are specified, the products dispensed or compounded are perfect, active and pure, will do much toward increasing profits and regaining or holding professional prestige. But this alone will not suffice, for that line of service is becoming more limited. We must study the new tendencies and determine where new fields of usefulness are open to us. The pharmacy is the logical source of aid, information and supply for both physician and patient, and it behooves us to keep abreast with modern demands. If a physician abandons the old-fashioned prescription and oral administration, for the more modern intravenous method, should we worry? No! We should prepare ourselves to meet his wants, make and supply the necessary sterile solutions in glass-stoppered bottles or ampoules. We can do it just as well as some Frenchman on the other side of the globe.

If a physician is strong for vaccine treatments, we should supply him not only with vaccines, but offer our service on everything that goes with it. If he insists on making his own bacteriological examinations, we can at least supply him

with the stains, reagents, etc. required for this work. Let us be ever on the alert to exploit every opportunity that offers a chance for professional service, and let us take care that we are equipped to render such service in a satisfactory manner.

Evolution of pharmacy will not mean its death or a loss to those engaged in its practice, so long as we will grasp the opportunities offered by evolution, remain on top of the wave of progress, and rectify those conditions or practices that tend to lower, undermine or destroy our professional existence. While we should not advertise the defects or shortcomings to be found in our profession, we must nevertheless meet the problem squarely and seriously.

There are so-called pharmacists practicing to-day, who are unable to meet even limited demands along the ordinary line of professional pharmaceutical service, to say nothing of keeping abreast with advancement.

There exist so-called pharmacies to-day and many, many of them, whose prescription-stock is out of all proportion with the income derived from this department, and even then it is too limited and too old, to make good service possible on the few prescriptions that are filled.

Many localities are still burdened with so-called pharmacies that serve only as a blind for the degrading traffic in liquor and narcotics, practices that should be entirely divorced from, and never allowed to soil the skirts of an honorable profession.

It is to our shame that such things are true, and it is such conditions that rob pharmacy of its professional standing with the public and other professions. They are the destructive elements whose insidious activities are so effective, that the combined efforts of those who strive to advance our profession fade into insignificance. That the real pharmacist suffers more from these conditions than the druggist with whom pharmacy is a side line, is obvious.

Proper laws and their enforcement are helpful means to eradicate or mitigate these evils, but the most effective weapon in our hands lies in the selection and training of our apprentices. They will be the pharmacists of tomorrow. Their ability, thought and ideals will shape its destiny. They will act, think, believe in, hold sacred and idealize as we teach them, and therein lies our responsibility to pharmacy. Its future, through them, is in our hands.

So, if we would serve ourselves, humanity and our profession, let us not only practice pharmacy but ensure its future by eradicating present evils and barring from its ranks the morally and mentally unfit or incapable.

THE CONVENTION.

THE A. Ph. A. Convention for 1914 is a thing of the past; its action is accomplished and its mission completed,—no, not completed, for the effects of its work will be felt for years to come in revivifying and renewing the soul of pharmacy,—its science, its erudition, its *technique*,—all that bestows upon pharmacy true dignity and honor.

For sixty-two years the Association has held these things in charge as a precious heritage. In every honorable and dignified way it has striven to uplift and dignify the name of Pharmacist; it has resisted the sordid spread of commercialism within the profession, and has labored to keep its shield clean and bright when sullied by the cankering rust of mercenariness, Thaler-lust, and all that tends to the degradation, the lowering of mentality and character to any class or to any man in which these things become the predominant passion.

High above the bitter strife for existence, the selfish war of the world, it has held aloft its proud banner inscribed A. Ph. A., which might well be read, *Ars, Pharo, Abante*,—art, beacon-light, advancement, and has steadily pursued its way undisturbed by the forces of evil, which, surrounding our profession, seek to degrade it to the lowest levels; to make it simply the means of the sordid accumulation of pelf, forgetful, if not ignorant, of those noble spirits who, despising the dross of life, have given to the profession its dignity, its character, its very life. Ignorant or forgetful of Paracelsus, Agricola, Sylvius, Boyle, Priestly, Lavoisier, and Scheele, and the hosts of others who have gone to their graves almost “unwept, unhonored and unsung,” while ennobling the calling the profession of the Pharmacist, and to whose efforts they are indebted for all the respect the profession of Pharmacy enjoys to-day.

In this world the forces of good and evil are always at war. Nobility is arrayed against rascality, virtue against vice; generosity against greed, and against all the beneficent forces of nature, are arrayed the evils of canker, rust, blight and decay. And so with Pharmacy:—men have taken its livery,—the livery of heaven,—to serve the devil of Mammon in. Around it and even within its ranks are those who know nothing and who care less of its history, its nobility, its character and its ideals and who would barter most willingly its honored name for a mess of pottage. To all these mercenary spirits the A. Ph. A. has turned a deaf ear and has held its rudder true to the pole-star of honor, of character, of self-respect, refusing to lower its unsullied flag or to allow its pure folds to be dragged in the foul pools of money-grubbing.

All honor to those who established the Association upon such memories and

such traditions; who used for its foundation this Ehrenbreitstein, of character; all honor to those who have so carefully and lovingly treasured its name and its reputation, and all honor to its rank and file, who, by their earnest support have made the A. Ph. A. the guiding-light of American Pharmacy and a beacon for the world.

God give them strength for their work, that there may come to Pharmacy the place and that distinction so long denied, so foully threatened, but which its service to the world,—a service of usefulness and honor justly entitles it.

The Convention was a distinct success in every particular. From the opening of the first session until the close of the meeting the feeling expressed by all in attendance was that it was one of great profit to every member present and to the whole profession of Pharmacy.

The arrangements made by the Local Committee were carried out in a manner beyond all praise. Every detail looking to the prompt and careful conduct of the Convention and the enjoyment and comfort of each individual member was carefully observed and the vote of thanks bestowed upon the Local Secretary and the Local Committee by the Convention at its last session was one which was thoroughly well deserved. It is much to be hoped that the routine of their work may be put in print for the guidance of future Local Committees, who too often enter upon their work full of zeal to do their best, but without any well-tried and perfectly-outlined plan of their duties, to act as a guide for them in their new and unusual work.

The experience of a local committee whose work has been so distinctly a success as that of the Detroit Committee would be most valuable to that of all future Local Committees.

Papers Presented at the Sixty-Second Annual Convention

HIGH GRADE CANDY: AS A SIDE LINE OF THE RETAIL DRUGGIST.

J. W. PEYTON.

In these days the patient who is really sick is hurried off to the sanitarium or hospital, where every thing is furnished the patient, and our business suffers thereby.

Department stores are taking a large share of the toilet-article and drug-sundry business and the price-cutter is found on nearly every hand. It's up to us to hustle other lines to make up the loss.

Then the cost of doing business is increasing all the time. Clerks must have more money to meet the high cost of living and the landlord wants more rent. More goods must be sold to meet this increase.

I know of no more attractive or profitable side than high-grade candy in attractive packages.

The first consideration is the brand to handle. Of course, any one already in the game has his own pet brand, but it is only fair to state that there are many good ones.

The one best known in your community, every thing else being equal, is the one to handle, if it can be had.

However, if your competitor has this one don't feel badly, for with any good candy and plenty of hard work you will be sure to get your share of the business. Right here I might add that the candy business is growing very rapidly and there seems to be no limit to its possibilities.

The experience of the writer was to take a comparatively unknown brand, selling at that time for 60 cents the pound retail, changed in a few months to 80 cents, and for a long time nearly every customer would say, "I won't pay you 80 cents; I will go to Blank's and get Blank's at 80 cents." (He carried a well-known brand.)

By the methods I will now take up in detail we made ours the best-known brand in this community.

Now for sale methods and publicity. Keep your candy well displayed in a nice candy case, and if in the summer, in a candy-refrigerator case. Have the case located in a prominent part of the store, near the door, if possible, so that every customer will see it coming in and going out. Keep a complete assortment of packages and keep them well displayed. Have plenty of signs telling both of quality and freshness.

If in summer, and kept in a refrigerator case, lay great stress on this fact. The

fresh story must be one of actual fact, as success depends greatly on always offering fresh goods. Far better lose some candy occasionally than sell stale candy. However hard you may try, a stale box may get out at some time, and when this occurs make it good with a fresh one without a word, unless it is to say that it affords you pleasure to adjust the matter in this way. In most cases the manufacturer will make this good.

Make orders small and often in the hot season and always by express. It is a find ad. to have a customer call for a certain package and find it out of stock, for in this way as in no other can you convince him you actually sell fresh candy. When a shipment is received take every package out of the case and put it in the case in such a way that the candy on hand will be sure to be passed out first. With this method there is practically no chance for stale candy. The brand we handle always comes by express, even in December, when the shipment amounts to more than two tons.

The fact that the goods come in original packages prevents any loss of weight and enables you to tell just what you make on the line.

Advertising:—We advertise in almost every conceivable way,—in the daily papers, writing our own copy and use frequently that furnished by the manufacturer; with signs on the store wall and on the show window; on our statement heads and the C. O. D. slips we send out, and in the theater program. Several times a year we make special candy windows, two of which we try to make especially attractive,—Christmas and Easter. We received the prize offered by our candy people for the most attractive Easter window.

One of our most successful methods has been to have a letter gotten out whenever a new and attractive package came out, telling the people that we would have a supply of this new candy on sale on the following Saturday.

For this we would get up a list of the people whom we know are either buyers of high-priced candy or should be, and have the manufacturer mail the letter mentioned above so as to be received not later than Friday. Be sure to have him say you will deliver the package if not convenient to call in person.

This letter has never failed to sell every package ordered for us.

Sending out a personal representative to solicit orders at such times as St. Valentine's Day, Easter or Christmas has been a great success. We have him call on all society people and on all firms and corporations, and from the firms and corporations we get some very large orders for the people they want to remember in a small way.

From the society people we get orders in advance for the handsomer holiday packages and many times orders for these are received after they are sold.

Many times when the order is not secured at the time the party will get an unexpected gift on Christmas morning and something must be done at once, and what is better on the spur of the moment than candy, so we get the order. In fact, we frequently carry an ad. on Christmas morning to this effect. Don't be afraid to suggest large packages as many times a one-pound buyer can be changed to a five or a three.

At certain times our two-pound sales nearly equal our one-pound sales. Buy-

ers of this candy are splendid customers in other lines and many of our best ones started in this way.

From a business of practically nothing in 1906 to nearly \$10,000 in 1913 and 1914 showing a healthy gain over 1913 is what the methods outlined have done for my firm.

From this you can easily see why I am enthusiastic over candy as a side line. I am anxious to do more and welcome any criticism or new ideas you may offer. I thank you.

To-day I find nearly as much candy sold at \$1.00 a pound as is sold at 80 cents.

CALENDARS AS AN ADVERTISING MEDIUM FOR RETAIL PHARMACISTS.

FRANKLIN M. APPLE, PHAR. D.

Business has been designated by some authors to be a *friendly* warfare, but the conditions that confront us to-day in mercantile transactions force us to believe that it can be more appropriately termed *fierce* warfare for the almighty dollar.

It is almost obligatory that merchants resort to some form of advertising in order to give due publicity to their establishments and wares. Incidentally it may be stated that many professional men are not averse to having the attention of the public directed to their talents by divers methods other than the usual manner of attracting the notice of the public, demonstrating an universally acknowledged necessity for advertising of some character or description, in accordance with one's code of ethics or business principles.

A great multiplicity of mediums for giving publicity to one's wares and mental equipment are available to-day, and one is frequently perplexed when endeavoring to arrive at a decision as to the most appropriate and the most effective one to employ—taking into consideration the very vital question of cost of said form of publicity.

Having experimented with various advertising mediums years ago, I found that calendars gave me the most desirable and effective method of appealing in a dignified manner to my neighbors for their support and patronage.

Calendars have the advantage of being up-to-date each day of the entire year, making a daily appeal for the consideration of those who may gaze upon them, and we well know that no home is too humble or too aristocratic to welcome the presence of a fitting, valuable and attractive calendar of proper size and color, clearly printed.

You will kindly observe that I have stated several qualifications for the model calendar, all of which I deem essential to its effectiveness, through continued use in the homes of one's patrons.

The size I have chosen ($5\frac{1}{2}$ in. x 9 in.) is one that can with propriety and pleas-

ure be given a space upon the wall in any room in the house, and its color,—white, with black type—will not offer any drawbacks to its hanging anywhere.

The printing should be clear, with as bold faced type as will harmonize with any cut that may appear thereon; and the calendar pad should be such that the dates can readily be read by anyone of average eyesight. Bold faced type should be used to the limit of the dimensions of the pad itself.

Being engaged in the drug business, I sought for a cardboard of the size desired, upon which was printed a scene that would be appropriate to and suggestive of my business, which I reasoned would add materially to its effectiveness. My search was rewarded, by accident, by the appearance upon the scene of a salesman who represented one of our foremost, world-wide famed firms of lithographers, who prepare programs and invitations for many pharmacy schools. His line of samples included a number of prints that were of the proper size to meet my demands, and appropriately suggestive of pharmacy, as I kept constantly in mind the idea of distinctive advertising of a drug store.

Just as it is appropriate and more effective for a bank to use a print suggesting security and safety in its advertising, so it is with a print descriptive of pharmacy to advertise our business and profession. The central idea being to call attention to the fact that it was from a drug store that the calendar was received; and if it is properly prepared it will be given a space in the home.

Having a variety of prints from which to select made it possible to use a series of them, one each year, making a set that has been preserved by some of my patrons for years.

It will be observed that one of these prints appears to have been prepared specially for my use, whereas the facts are that it was a stock plate that was altered, without extra cost to me, to serve my purposes. You can imagine the effect such an apparently individual calendar had upon my patrons, leading them to believe it to be a very costly one, the result of personal study and design; also adding to the value of succeeding ones.

Persistency of advertising has been stated to be essential to the effectiveness of the effort to attract and retain trade; and by adhering to this form of distinctive advertising, we have been able to reap a satisfactory reward from our efforts and expenditure along this line.

In order to make our calendars more valuable to our patrons, therefore adding to the possibilities of their retention and use by the customer daily, we have had printed upon the reverse side thereof some information that quite likely would appeal to the members of the household and which they wished to preserve in a convenient place. What more convenient place to have it than upon the daily calendar, which they would not be likely to misplace or store away somewhere to be soon forgotten?

You will undoubtedly think that the cost of this very high-grade, appropriate, suggestive and effective advertising is extremely high, but I can assure you that I have found it to be very reasonable, considering the results obtained from its use.

Probably it has become apparent to you by this time that it is vital that careful thought be given to the selection of an advertising medium and that the minor

details of the one selected be not overlooked in order to reach the desired end, with the richest harvest as a reward for your efforts.

Lay out your plans for an advertising campaign as a general lays out his plans for a battle and you will not run a very great risk of squandering your appropriation for publicity; and don't overlook the possibilities of the calendar as an advertising medium for retail pharmacists.

"WHAT ADVERTISING METHODS DO WE EMPLOY?"

R. A. LEET, OAKLAND, CAL.

In the first place we employ an advertising expert to advise us as to the mediums to be selected and the extent to which each shall be made use of. We also arrange that he shall attend to all of the details incidental to the carrying out of our advertising program. It is then assured that copy will be changed regularly, and that seasonal advertising will be looked after at the proper period. Regular interviews are arranged for with our advertising manager to furnish him material for copy, and enough matter is always kept ahead so that the change of copy shall occur without interruption, even though an interview or two should be missed. The advertising man is given freedom to consult with certain of the employees in order to get the real local color and atmosphere to his announcements and descriptions.

He is expected to see that a circular, descriptive of the drug store articles that would interest the mother of a very young child, goes each month to the birth list. He is expected to see that vacation suggestions, on a circular that can be checked off and used as a shopper's memorandum, gets into the hands of practically all of the people who take vacations and might use our stores. He is expected to have a circular pertaining to seasonable items ready for each month's statements, and circulars to go out in the packages to boost the sale of our specialties. He is supposed to keep track of the special occasions on the calendar and to have appropriate reference to them in our advertisement when business can be thereby promoted. He is also supposed to supply the copy for the "ho'd up" publications—those programs and year books, etc., that you don't consider to be worth much of anything to you for advertising mediums, but which, for certain reasons, you can't get out of patronizing. These usually require of the man, who is not an advertising specialist, the making up of extemporaneous copy—copy that must be ground out while the solicitor waits, and while your mind is distracted with other thoughts. But your advertising man will suit the copy to the medium and get some value for you even from this sort of advertising.

The thing that I would like to make the strongest in this paper is the advantage that lies in having an advertising man who has no other duty, so far as your business is concerned, except to look after your advertising. I don't think any business should attempt to do any advertising until it can be safely assured that

there will be no interruption in the regular appearance of copy, and no duplication of copy where it would be more profitable to have it changed.

It has always been a matter of regret to me that we did not make use of an advertising expert earlier in our business career. There is scarcely any business so small that it can not to advantage employ an expert to look after its advertising. This does not mean that he shall give his time exclusively, but that it shall be strictly up to him to see that the advertisements always appear on time and that the copy is as agreed upon.

Employ a local man—or *woman* for that matter. (Some of the best “ad” writers are women nowadays.) Give them the advantage of a subscription to some advertising system applicable to your line of business if you wish; but by all means have your “ads” written specially for your store, and specially for the articles that you wish to promote. This long distance advertising bears about the same relation to real advertising that canned vegetables do to fresh ones, and your customers can detect it quite as readily as they can detect the canned article in the vegetable line.

Be cold blooded in the matter of deciding what you shall spend on your advertising and keep within the limit of your appropriation. The amount that you are justified in spending will vary with the character of the business which you conduct. It is generally considered that the amount that should be spent lies somewhere between one and three percent. of your gross receipts in an ordinary retail business. Advertising certainly pays, but it has to be looked after very carefully.

When you take on an advertising manager, it should not mean that there should be any less of your personality in your advertising. You *could* probably write better advertisements than any advertising man that you can employ if you could side-track everything else and give your “ad” writing right of way; but it is necessary to have him in order that the work shall be done in a regular, orderly fashion, and that you may get the benefit of the observations of a man whose whole business is to keep abreast of the times in the field of advertising. You must, however, dictate for yourself the policy of the advertisements and see to it that their tone and character are the tone and character that you wish your business itself to take on.

BOOSTING THE BIOLOGICAL BUSINESS.

WALTER M. CHASE.

In the effort to build up a profitable “ethical” drug business the druggist finds oftentimes that he has developed a liability rather than an asset. He is obliged to peddle out the preparations of the detail man’s house at almost cost, to sell cigars at cost, and to hand over tablets and pills in lots of a dozen at a time at the 10,000 rate. All this for the sake of saying that he sells the doctor his supplies. But there is a line where the goods sold to the M Ds. pay a reasonable

profit (from 13 to 33%), where the demand is good and where the unsalable goods may be returned for credit. This line is the handling and sale of biological products.

We carry a complete line of bacterial products ranging from small-pox vaccine points to the newest phylacogen, keeping them in a specially constructed ice box so that the proper even temperature may be maintained at all times. A full stock is always on hand as we run no danger of overloading for when the time of potency is past they may be returned for credit. We carry but one manufacturer's line and that is a good one, a line that any physician will recognize as a standard.

But after having the stock complete, reliable, and fresh, we must dispose of it. To do this we proceed in several ways. We call the attention of every doctor that comes into the store to the fact that we have the line and offer to explain and show it to him. Each month we send to physicians on our mailing-list a personal letter or literature furnished by the manufacturer stating the advantages of a particular vaccine, serum or phylacogen. From time to time we call on the M. Ds. and show up to them something new in the line of biologicals; and there is always something new. If we hear of an accident in our vicinity we notify the doctor in charge that our antitetanic serum is available and offer to send several packages with the understanding that they may be returned if not used. In our monthly letter sent to the physicians on the first of July we always lay stress on the fact that we are prepared to furnish antitetanic serum for any accidents occasioned by fireworks on the "Fourth." If, as is oftentimes the case, there is a small-pox or diphtheria "scare" in an outlying town we send the doctors there a letter calling attention to the fact that they may secure the proper vaccine or serum by return mail. We have built up an appreciable trade among the physicians in our surrounding territory by means of personal letters detailing the bacterial products. We endeavor to get them to anticipate their needs for the more common preparations as small-pox and furunculosis vaccines, rheumatic phylacogen, etc., agreeing to take back any that are not used before their potency expires.

Aside from the business obtained from the doctors of medicine we have developed a most gratifying trade for veterinary biological products among the veterinary surgeons in our territory. In this city are a number of large dealers in Western-bred horses for use on the lumbering operations in the woods of Maine. These horses on their arrival from the west require acclimatization, being particularly susceptible to a form of influenza. The veterinarians find that equine influenza vaccine works remarkably well in these cases. A number of large herds of milch cows furnish an outlet for an appreciable amount of mallein. At certain seasons of the year many dogs (some of them being valuable hunters) are affected with a distemper. At these times by calling the attention of the veterinarians to the canine distemper vaccines, both curative and prophylactic we dispose of very satisfactory amounts. Veterinary antitetanic and antistreptococcic serums are preparations on which we have worked up a very satisfactory trade by employing methods similar to those used with the human bacterials.

A most important factor in handling biological products is the necessity of the

handler having at least a working knowledge of the various products and their uses, and an ability to discuss them intelligently. Owing to their comparatively recent adoption by the medical profession many M. Ds. possess rather hazy ideas as to the kinds and uses of the biologicals and as a consequence depend upon the druggist being able to explain to them the difference between a vaccine and a serum, between a toxin and a phylacogen or between tuberculin B. E. and tuberculin B. F. The comparatively small amount of time required for the druggist to gain this knowledge is time well spent when viewed in the light of added business obtained as a result of the knowledge.

DOES IT PAY TO CULTIVATE THE BUSINESS OF DISPENSING DOCTORS?

E. G. MCCLALLEN.

If dispensing doctors use goods that you sell and will buy of you at a price that gives you a respectable margin of profit, sell them. Cultivate their trade and friendship.

The above is the rule we use and have found it very satisfactory. Fortunately, the doctors in our immediate vicinity do not dispense only what emergency medicine they need. The few dispensing ones we find good customers for gauze, cotton, ligatures, gloves, syringes, hypo-syringes, needles, etc. We do not try hard to sell them tablets unless they want tablets made by the most reputable houses, and then we sell them at the regular price established by the house.

The country doctors have to dispense, and we have found many good customers among them. In order to protect our own interest we have divided them into three lots.

Lot A:—The doctors that want good goods and are prompt in paying. These are worth working hard for, and you can offer to make them low prices to meet competition.

Lot B:—Doctors that will use good goods, but are very slow pay. While we encourage these doctors' trade up to a certain credit, we cannot make so hard an effort to hold them; nor can we make them so good a price.

Lot C—Doctors that are out to buy the cheapest thing they can get; and doctors that we know to have the habit of not paying their bills.

With Lot C we do a cash business only. Not soliciting trade, only serving them when they ask it.

The friendship of the dispensing doctor is just as valuable as the friendship of any one else. He will go a long ways to return your favors and if you can arrange your buying so as to make him a good fair price, you will find him a good customer and a warm friend. He will carry words of praise for your store into many homes; and can, and will send you many customers for such articles as bed-pans, urinals, crutches, trusses and in many cases ointments and tonics.

While we would all like to see each doctor a prescription-writer, we must take conditions as we find them. We have tried hard to get the run of prices offered to the doctors from physicians' supply houses, and on a great many articles we find we can sell them at the same price and make a good fair profit.

Surgical instruments we sell from catalogues only, except some of the smaller and more used articles.

In order to sell the dispensing doctors we are of course obliged to carry a larger stock of many items, and have to insist on the very best terms from a great number of manufacturers.

A little missionary work among the class A and B doctors and a hard effort to keep in stock the items you can interest them in, courteous treatment, quick service and you can develop a good, satisfactory business.

DOES IT PAY TO CULTIVATE THE BUSINESS OF DISPENSING PHYSICIANS?

ARTHUR S. WARDLE.

Unqualifiedly, yes; it does. I base this assertion on years of experience in a city of twelve thousand inhabitants. I deduce that catering to the physicians' trade pays for these reasons:

First:—Such a policy enables the druggist to buy in quantity lots and so take advantage of the generous discounts thereby obtained.

Second:—The risk is small and the profits large.

Third:—Selling physicians their pharmaceuticals paves the way for an extensive trade in cottons, dressings, ligatures, elastic hosiery, trusses, surgical instruments, biologicals, office furniture, etc., the profits on which are exceptionally large.

Fourth:—It opens a channel for a pharmacist to put out a line of his own pharmaceuticals, dressings, and specialties at a handsome profit.

Fifth:—There is no better advertising medium. It will build up a prescription trade and give a store prestige.

Sixth:—It greatly enlarges a firm's territory and so makes it comparatively independent of local conditions.

Seventh:—It minimizes the purely mercantile features and emphasizes the professional side of the drug business and so insures the mental and professional growth of the pharmacist.

In further discussion of this question I would mention the following conditions as essential to success and offer a few suggestions:—

First:—Cultivate the patronage of only such physicians as are reputable and good pay. Let your competitors have the rest.

Second:—Be absolutely loyal to the interests of these physicians and discreet. Fill their orders promptly and accurately.

Third:—Make it a point to connect yourself with the reputable manufacturing chemists whose goods these physicians prefer. First class manufacturers are only too eager to make attractive propositions to pharmacists who can use quantity lots and pay their bills promptly. Their special discount concessions enable the buyer to dispense to the physician on satisfactory terms at a decided profit.

Fourth:—Next bring to the physicians' notice and push in every way, surgical supplies and sick-room necessities and have as many of these goods as possible under your own label. Profits on these lines range from thirty to eighty percent and, indirectly, the advertising derived, from the laity seeing your name on each article, is worth considerable.

Fifth:—Stand for quality, first, last and always. A physician and his patients want results. If a store is known as a physicians' supply store where the best of everything can be procured without delay, it will be heartily endorsed by the leading physicians and both physician and patient will gladly pay well for the superior article and service offered.

Sixth:—By means of correspondence, personal visit, and parcel post, get in touch with and sell to physicians in the outlying districts within a radius of fifty miles. They dispense practically everything so their orders are usually larger than the city customer and the cost of selling proportionately smaller. When, because of local industrial or other conditions, trade would otherwise be dull, the accounts of these physicians in the suburban sections help to tide over until local conditions become normal.

Seventh:—If you would successfully and profitably cultivate the patronage of the dispensing physician, you must read pharmaceutical journals and study trade catalogs. You must be thoroughly conversant with all that is newest in pharmaceuticals, appliances, etc., and so make yourself invaluable to the busy practitioner. Cultivate the friendship of the traveling salesman who cover your territory. They have many an opportunity to offer you something worth while, or speak a good word for you that will mean added profits.

I know of a drug firm whose business, conducted along the lines mentioned above, has increased ten-fold in fifteen years with losses averaging less than half of one percent.

HARMLESS CURSES.

Maledictions are not so scarce as to be satisfactory explanations of disasters. Guiteau cursed everybody connected with his trial and execution, but the foreman of the jury only died within a few weeks at the age of about ninety. The Emperor Francis Joseph is said to have been cursed, but it is curious if that curse brought death and destruction to his wife and his nephew and his sons and other connections, while he is still living. A great many kings, nobles, landlords and employers and parties to an ordinary quarrel have been cursed, and their misfortunes do not loom up sufficiently to impress the reflecting person with the potency of an imprecation.—*Philadelphia Record*.

Necrology

William Estell Lee, of Philadelphia, died on July 20, 1914, at his home after several months' illness, of heart trouble, at the age of sixty-four years.

Mr. Lee was born in Woodbury, New Jersey, of the late Walter B. and Martha Lee. Receiving his early education in the public schools of that town, he then studied pharmacy, with B. F. Carter, of Woodbury. Later, he matriculated at the Philadelphia College of Pharmacy, graduating therefrom in 1872, the subject of his thesis being "Gnaphalium Polycephalum."

A few years later he opened a drug store at 2337 Brown Street, Philadelphia, where he remained for over forty years.

Mr. Lee showed his devotion to his Alma Mater. For many years he has served as a member of its Board of Trustees, and during the past college year, (1913-14), he was President of the Alumni Association, and rendered it very valuable services, especially as Chairman of the Committee on Membership. He was a member of the P. A. R. D., and the N. A. R. D. He joined the American Pharmaceutical Association in 1905.

He was an ardent Mason. For 15 years he was treasurer of Olivet Lodge, No. 607, A. F. and A. M. He was a member of Harmony Chapter, No. 52, Royal and Select Masters, and Corinthian Chasseur Commandery, No. 53, K. T. He was a member, also, of Marathon Senate, No. 4, O. of S.; Woodbury Lodge of New Jersey, I. O. O. F.; "Goodwill Council;" Legion Red Cross, and Crescent Chapter 104, O. E. S.

Mr. Lee was a member of the Olivet Covenant Presbyterian Church, and was an earnest worker in the cause of civic reform.

Since early manhood, Mr. Lee took an active part in reform politics and civic movements, but only last year could he be induced to become a candidate for any office. At the last primary election, he was the successful nominee for the Pennsylvania Legislature on the Washington ticket, tenth legislative district. His strength as a reform candidate was shown at the last election, when, as a candidate for Select Councilman in the fifteenth ward, he was defeated by the "organization" by a small margin only.

Personally, Mr. Lee was genial, warm-hearted and true to the highest ideals. He believed that character was the most important thing in life, and that the dollar was only a means to an end. He did a man's work and exerted an influence for good that cannot be measured, because his deeds will long live after him. Quiet and modest, but positive in matters of principle, he practiced in life those principles of religion and morality which stamped him as a man among men; he brought honor to his craft, and won the respect and love of his fellows, hundreds testifying of his aid to them in sickness and in trouble.

His widow, Nellie Florence Lee, Secretary of the Women's Branch of the National Association of Retail Druggists and President of the Philadelphia Chapter of that organization, with a son, Dr. Walter Estell Lee, survive him.

The funeral was held on Thursday, July 23rd, at 2 P. M., from his late residence, 823 North Fourth Street, the services being conducted by Rev. Matthew J. Hyman of the Olivet Covenant Presbyterian Church and the officers of the lodge. The interment was at West Laurel Cemetery. The pallbearers were: Frank B. Rohrman, president of the Philadelphia Wholesale Drug Company; William C. Neely, representing the Olivet Lodge, A. F. and A. M.; Samuel C. Henry of the Executive Committee of the National Association of Retail Druggists; Professor Joseph P. Remington, Dean of the Philadelphia College of Pharmacy; J. W. England, of the American Pharmaceutical Association, and A. J. Kellar, president of the Philadelphia Association of Retail Druggists. The honorary pallbearers were the following directors of the Philadelphia Wholesale Drug Company; Henry C. Blair, Vice President, O. W. Osterlund, H. C. Clapham, Howard E. Siegfried, Russell F. Blackwood and George H. Fehr. In addition, David G. Potts, Frank E. Morgan, Frank W. Fluck, and Charles E. King, represented the Philadelphia Association of Retail Druggists, and J. C. Peacock, Vice President, David J. Reese, Secretary, L. H. Davis, Assistant Secretary, and F. P. Streeper of the Executive Committee, represented the Pennsylvania Pharmaceutical Association.

SOME PRACTICAL POINTS IN MANUFACTURING PHARMACY.

E. L. MAINES, PH. C., PHAR. D. AND R. J. GARDNER, PH. G.

Pharmaceutical production, on a large scale, is necessarily governed by different methods of procedure than retail or commercial pharmacy. Some of the following hints, however, may be adopted by the retail pharmacist with considerable gain, both as to the time employed in making, and the appearance of the finished product.

Liquor Cresolis Compositus: In the manufacture of Compound Solution of Cresol, it is not advisable to follow the exact directions of the United States Pharmacopœia; the following formula and method of procedure having been found to produce better results.

Cresol	50%
Linseed Oil	35%
Potassium Hydroxide	8%
Water	q. s.

Place the potassium hydroxide in a steam-jacketed kettle or tank, equipped with an agitator, and add sufficient water to dissolve the potassium hydroxide. Turn steam on kettle, keep agitator running, and add the linseed oil. Stir until the soap becomes clearly soluble in distilled water, adding small quantities of water from time to time in order to complete the saponification. The soap must completely dissolve in distilled water and leave no oil-globules floating on the liquid. Add the cresol gradually, constantly stirring the mixture until a clear solution is produced. Finally add sufficient water to make the desired yield, if necessary.

It is not necessary to use any specified amount of water in the manufacture of Compound Solution of Cresol, as any excess may be quickly evaporated in the steam kettle before adding the cresol. Any excess of water can easily be determined by noting the consistency of the soap. This is an important point to be observed, as it is the key to the successful manufacture of this product.

The authors can manufacture one thousand gallons in three hours, the product complying with all government requirements; whereas, to our knowledge, it has taken three days to produce a like amount by others who used the U. S. P. method.

Any galvanized-iron tank equipped with steam coils and a simple mechanical stirring device, is all that is necessary for the manufacture of *Liquor Cresolis Compositus*, although copper, or enameled steam-kettles may be used.

If the Pharmacopœial directions are strictly followed, it is impossible to make

a satisfactory preparation, or one that will mix clearly with water in any proportion.

Fluidextract Cascara Sagrada Aromatic.—In the manufacture of the various Fluidextracts of Cascara Sagrada Aromatic, a slight modification of the general methods will produce a superior product and one which is not necessary to age for so long a time. Aromatic Fluidextracts of Cascara are generally treated with calcined magnesia to remove bitter principles, then percolated with hot water to extract their active constituents, and made palatable by adding licorice, sugar and aromatic oils. Fluidextracts of Cascara are always aged, to allow the precipitation of inert material before being bottled for the trade. This can be overcome, in a great measure, by percolating the ground licorice separately. Place the licorice in a suitable percolator and exhaust the drug with hot water. Never allow the drug to macerate over three hours. Concentrate the weak percolates, make up to desired yield, place in a suitable container and precipitate the inert material by the addition of stronger ammonia water. This can be accomplished by the addition of about one ounce of stronger ammonia water to each gallon of licorice-percolate. As is well known the ammonia water has the additional advantage of intensifying the sweetness of the licorice.

Syphon off the clear portion and filter the remainder through canton-flannel. Exhaust the ground cascara with hot water after allowing the drug to macerate three hours. Mix the two liquids, add the sugar and aromatic oils dissolved in alcohol, and filter when ready for use.

Note.—The authors are experimenting upon a method which is not yet completed and by which Fluidextract Cascara Sagrada Aromatic can be used within twenty-four hours after manufacture and still have no precipitation.

FLUIDEXTRACT-MANUFACTURE NOTES.

1. *Fineness of Powder*.—Always use a No. 16 to No. 20 powder for percolation. A finer powder than this clogs up in the percolator and does not admit of complete exhaustion. This applies to manufacture on a large scale only.

2. *Alcoholic Percolation*.—In the percolation of drugs with 95% Alcohol, do not moisten the drug before packing in the percolator. Simply pack the drug dry and add the menstruum of 95% Alcohol directly to the percolator.

3. *Aqueous Percolation*.—In the aqueous percolation of such drugs as, cascara, licorice, senna, etc., be sure they do not macerate over three hours. Moisten well, place in percolator, add hot water, macerate three hours and then draw off the percolate. Continue this until the drug is completely exhausted.

If allowed to stand more than three hours the drug gelatinizes in the percolator and makes its extraction extremely difficult and tedious.

4. *Fluidextracts of the Alkaloidal Drugs*.—The percolate from all fluidextracts of the alkaloidal drugs should be concentrated in *vacuo* with the possible exception of opium, ipecac and hydrastis.

If ordinary stills are used there is great danger of decomposing the alkaloids.

Resina Jalapæ.—In the manufacture of resin of jalap, great care should be taken to wash out *all extractive matter* with both hot and cold water. If this is done properly the resulting yield will be non-hygroscopic.

Extractum Cubebæ, By-Product:—In the manufacture of Extract of Cubebs the Oil of Cubebs can be obtained as a by-product by simply re-distilling the exhausted drug.

Three hundred pounds of drug will yield, from fifty to sixty pounds of extract. The exhausted drug, in turn, will yield ten to twelve pints of Oil of Cubebs which complies with all U. S. P. requirements.

Fluid Orange Soluble, By-Product:—Oil of Orange may be obtained in the manufacture of Fluid Orange Soluble by distilling the separated oil.

Eight hundred pounds of drug, yielding sixteen hundred pints of Fluid Orange Soluble, will give a corresponding yield of ten to fourteen pints of oil of orange.

In the production of pharmaceutical products, the manufacturer has called to his aid every mechanical device whereby he may keep pace with pharmaceutical progress.

Vacuum-stills and dryers, mixers, granulators, mills, etc., enable the manufacturer to produce, within two or three days, the same amount of finished product that would ordinarily require one or two weeks to manufacture.

Thus the human factor has largely been eliminated and manual labor superseded by mechanical aids which enable the producer to manufacture with greater accuracy and to market preparations of a better quality.

MANUFACTURING LABORATORIES, BRISTOL-MYERS COMPANY, August 7th, 1914.

AMYL NITRITE; ITS PREPARATION, PURITY AND TESTS.

FRANK O. TAYLOR, PH. C.

From time to time during the past thirty-five years there have appeared articles on amyl nitrite dealing with the manufacture, impurities, assay and therapeutic effects. A number of these record investigations of the quality of commercial grades of amyl nitrite, chiefly by some method of assay and in a less number of cases by fractional distillation, together with some qualitative tests for aldehyde, nitropentane, etc. The collective evidence of these shows that the quality of much of the amyl nitrite on the market has always been inferior and, further, that the improvement following the publication of these investigations and criticisms has been by no means marked.

At the risk of re-treading ground already well explored the writer desires to record here results obtained in both experimental and practical work during some years past, to call attention to a number of facts of which he has seen no published mention and suggest higher standards and better tests than are now universally included in the various pharmacopœias. The pharmacopœial requirements are in some things too rigid and in others not sufficiently severe. The following brief *resume* of the requirements of a number of pharmacopœias is given so that proper comparison may easily be made, reserving comment on these statements until later:

Definition and Description.—Of the nine pharmacopœias examined only two, the U. S. and British, include a definition as distinguished from the description.

*Read at the Rochester Meeting of the A. C. S.

U. S. P.—"A liquid containing about 80 percent. of amyl (chiefly iso-amyl) nitrite ($C_5H_{11}NO_2$), together with variable quantities of undetermined compounds."

B. P.—"A liquid produced by the interaction of amylic alcohol which has been distilled between 262° and 270° F. (127.7° to 132.2° C.) and nitrous acid. It consists chiefly of iso-amyl nitrite, $C_5H_{11}NO_2$, but contains also the nitrites of the homologous series."

The description of amyl nitrite as regards color, odor, volatility and general physical characteristics is practically the same in all the pharmacopœias examined.

Specific Gravity.—The *U. S. P.* gives 0.865-0.875 at 25° C. which agrees with 0.870-0.880 at 15° C. as stated by the British, German, Austrian and Japanese pharmacopœias; the Italian gives 0.870-0.890; the Swiss and Belgian give 0.870-0.900, and the French gives about 0.88.

Boiling Point.—The *U. S.* and French pharmacopœias indicate 96° - 99° but the French gives among other tests a qualifying statement to the effect that amyl nitrite should completely distill below 110° . The German, Swiss Austrian, Italian and Japanese pharmacopœias state the boiling point as 97° - 99° , the Belgian gives about 99° while the British more properly makes the following statement:

"Submitted to distillation, about 70 percent. passes over between 194° and 212° F. (90° and 100° C.), the bulb of the thermometer not dipping below the surface of the residual liquid."

Acidity.—All except the Swiss pharmacopœia give some test for acidity, for typical examples of which the *U. S. P.* and *Ph. G.* tests are given here:

U. S. P.—"If 1 cc. normal potassium hydrate *V. S.* and 10 cc. of water be mixed with a drop of phenolphthalein *T. S.*, then 5 cc. of amyl nitrite added, and the tubes inverted a few times, the red tint of the aqueous layer should still be perceptible (limit of free acid)."

Ph. G.—"5 c. c. of amyl nitrite shall not neutralize the alkaline reaction of a mixture of 0.1 c. c. ammonia and 1 c. c. of water."

Aldehyde.—All nine of the above-mentioned pharmacopœias give a test for aldehydes of which that of the *U. S. P.* is typical.

"A mixture of 1.5 cc. of silver nitrite *T. S.* and 1.5 cc. of alcohol with a few drops of ammonia water should not become brown or black if 1 cc. of amyl nitrite be added and the mixture gently heated."

Water.—All except the Italian and Swiss pharmacopœias direct that amyl nitrite when cooled to 0° C. should not become turbid, showing absence of water.

Assay.—Only the *U. S. P.* and *B. P.* include a process for assay which in each case is an adaptation of the well-known gasometric estimation of nitric oxide produced by the reaction of the nitrite with potassium iodide and sulphuric acid.

As will be shown, much of the amyl nitrite on the market does not come up to the standard of strength which can be profitably attained on a commercial scale and certain impurities not detectable by any of the above tests may be present. It has been the intention therefore to collect published data, add to it results of a number of experiments and fix upon a standard severe enough to exclude therapeutically undesirable products and lenient enough to admit a grade commer-

cially obtainable and as definite as the complex nature of an acceptable amyl nitrite will permit.

AMYL ALCOHOL USED.

Commercial amyl alcohol is well known to be far from a pure substance and even the grades below that of highest purity contain notable quantities of impurities. Besides the active and inactive or iso-amyl alcohols which are always present together, there may be found iso-butyl, normal propyl and ethyl alcohols and often other of the various amyl, butyl and propyl alcohols. The action of nitrous acid on such mixtures would give very varied results, hence it is essential that an alcohol be used which is as pure as can be made without unduly increasing its cost.

The boiling point of amyl alcohol is variously stated and it would seem that some of the earlier investigators of amyl nitrite failed to distinguish between the active amyl and iso-amyl alcohols, or as they are sometimes known, the α - and β -iso-amyl alcohols.

Umney in 1870 (Pharm. Jour. (3) 1, 422) in an article on amyl nitrite states that amyl alcohol boils at 132°.

Tanner in 1872 (Pharm. Jour. (3) 2, 421) states that it boils when pure at 132° and for making amyl nitrite should distill "near 132°."

Dott in 1878 (Pharm. Jour. (3) 9, 172) says: "There is an amylic alcohol or mixture of alcohols boiling at 128°-129°."

The following year Greene (Am. Jour. Pharm., 1879, 65) in criticizing this paper of Dott's says that iso-amyl alcohol, "when carefully separated from fusel oil by fractional distillation, boils constantly at 132°. Portions may be obtained which when fractionated in an imperfect apparatus may pass entirely at 128° to 129°, but, if these be subjected to several careful rectifications in a suitable fractionating apparatus, they may be entirely resolved into the alcohol, boiling at 132° and iso-butylic alcohol boiling at 109°." He considers an alcohol distilling between 128° and 132° as pure enough for making amyl nitrite.

Dott (Pharm. Jour. (3) 10, 231) replies to Greene and reiterates his statement of the boiling point of amyl alcohol, bringing experimental proof of the same.

Squibb (Ephemeris II, 701) gives "about 132°" as the proper boiling point for alcohol to be used in amyl nitrite manufacture.

Dunstan & Williams in 1888 (Pharm. Jour. (3) 19, 487) gives 127° to 132° as the boiling point of the amyl alcohol of commerce and says, "in the portions of fusel oil which has been repeatedly fractionated between 127°-132° there is said to be usually about 13 percent. of the active alcohol. These alcohols cannot be separated by fractional distillation, since the α -amyl alcohol boils at 128° and the β -amyl alcohol at 131°." (This last statement is evidently a misprint as the boiling points of these alcohols should be reversed.)

Curtman before the A. Ph. A. in 1892 (Proc. A. Ph. A., 1892, 159) states that what is usually sold as "purified amyl alcohol" is the fraction of fusel oil between 125° and 140°.

Researches in pure chemistry, carried on at different times, have shown the boiling point of the active alcohol to be 128° and that of the iso-amyl to be

131.5°. A boiling point of 128°-132° will include both but exclude the chief portion of impurities, while a range of 130°-132° admits an alcohol consisting chiefly of iso-amyl alcohol.

METHODS OF PREPARATION.

Having obtained a properly purified alcohol, four general methods present themselves as suitable for producing amyl nitrite. *First*, direct heating with nitric acid; *second*, heating with nitric acid, sulphuric acid, and copper; *third*, by reaction between alkali-nitrite, sulphuric acid and amyl alcohol; and, *fourth*, by producing nitrous gas with nitric acid and arsenous acid or starch, and passing this through the alcohol. Other methods of less importance have been advocated but they have not received application except in a small way.

The first method is that originally proposed by Balard the discoverer of amyl nitrite, and has had numerous advocates, notable among them being John M. Maisch, (*Am. Jour. Phar.*, 1871, 146) and E. R. Squibb (*Ephemeris* 11, 701). Maisch states that the yield of nitrite distilling between 95° and 100° is small and mentions the fact that amyl nitrite, aldehyde, ethyl-amyl ether and hydrocyanic acid are also formed. The nitric acid and amyl alcohol are heated together carefully and all that product of the reaction collected which distills below 100° C. This is purified by washing with a solution of potash or potassium carbonate to remove acids and then distilled; all that comes over below 96° and above 100° being rejected. This will lead to the rejection of much amyl nitrite if the nitrite is not dried before distillation, for, as will be seen later, amyl nitrite and water distill together as a binary mixture at about 80°. Squibb distilled off all below 100° and purified by agitation with a solution of sodium carbonate, then rectified, rejecting only the portion above 100°, removing water subsequently by freezing. This obviates the difficulty connected with the purification of Maisch, but is liable to introduce another, tho in much less degree, for a binary mixture of iso-amyl alcohol and water distills at 95°. It is therefore always preferable to both wash with the alkaline solution and dry thoroughly before rectification.

A. B. Tanner (*Pharm. Jour.* (3) 2, 421) advocates the second method, the product of the reaction being distilled as made, below 98°. This is washed with solution sodium hydroxide and rectified over fused potassium carbonate, the portion distilling between 95° and 100° being collected for medicinal use. This method is liable to produce still more impurities than the first and however well they may be separated by fractionation the amyl nitrite so produced can by no means be considered a pure product and the yield will also be low.

The third method will undoubtedly produce the purest product, giving at the same time, if carefully carried out, a good yield. This process however is not suited to manufacture on a large scale tho excellently adapted for purely scientific work. A very pure alcohol is necessary and the increased expense of production is not justified by the greater purity of the product as the difference is not sufficient to cause any marked difference in therapeutic action. Greene (*Am. Jour. Pharm.*, 1879, 65) says that "a fair yield may be obtained" in this manner. He heats potassium nitrite with the amyl alcohol on a water bath and gradually adds sulphuric acid diluted with an equal volume of water. The amyl nitrite distils.

over and has to be purified by washing with potassium carbonate solution, drying with the fused salt and distilling; all that passes over below 100° being retained. This process is objectionable because of the heat being applied during the reaction. Dunstan and Wooley (Pharm. Jour. (3) 19, 487) give a process for the manufacture of iso-butyl nitrite which is exactly the same as that which they use for amyl nitrite. The quantities were calculated according to the equation:—

$2C_5H_{11}OH + H_2SO_4 + 2NaNO_2 = 2C_5H_{11}NO_2 + Na_2SO_4 + 2H_2O$ and a slight excess of sodium nitrite used. The acid was gradually mixed with the alcohol, the mixture cooled and poured very slowly to the bottom of a solution of the sodium nitrite in three parts of water, keeping the whole cooled to 10° or 12° . The amyl nitrite formed floats on the aqueous layer and is washed with alkaline carbonate solution and dried over fused potassium carbonate. If absolutely pure reagents are used, the amyl nitrite so formed requires no distillation and is almost perfectly pure. With less pure grades of alcohol, distillation must be resorted to.

The fourth process is more frequently recommended than any other. Umney (Pharm. Jour. (3) 1, 422) says that "true amyl nitrite should be made by passing nitrous acid into amyl alcohol" and proceeds to define the nature of the alcohol.

Hilger (Archiv. d. Pharm., 1874, 485) recommends the production of nitrous acid from arsenous and nitric acids and passing this gas into amyl alcohol until no odor of the alcohol remains. This method of determining the end of the process is both crude and unpleasant, as an attempt to detect amyl alcohol in the nitrite by odor will demonstrate. D. B. Dott (Pharm. Jour. (3) 9, 172) also considers this process much better than that using nitric acid, but does not compare it to third process given here.

The investigations of Williams and Smith (Pharm. Jour. (3) 16, 499) have shown the variation in yield of amyl nitrite due to the use of nitric acid of different strengths for generating the nitrous acid. Herein lies one of the chief objections to the process, that the nature of the gas given off when nitric acid reacts with arsenous acid is complex, and variable according to temperature and strength of acid.

Stenhouse and Groves in 1877 (Jour. Chem. Soc., 1877, i, 545) call attention to the variable composition of the gases so formed and recommended nitric acid of specific gravity 1.30-1.31 and a temperature of 70° as giving the most N_2O_3 . Lunge (Berichte 17, 1641) says that acid of 1.35 specific gravity produces large quantities of N_2O_3 along with N_2O_4 and that acid of specific gravity 1.5 produces chiefly N_2O_4 with some N_2O_3 . Ramsey and Cundall in a research on the oxides of nitrogen (Jour. Chem. Soc., 1885, 197), in which they employed arsenious acid, and nitric acid of specific gravity 1.5, state that "arsenious oxide when heated with nitric acid gives a liquid containing N_2O_3 according to the equation $2HNO_3 + As_2O_3 + nH_2O = N_2O_3 + As_2O_5 + (n+1)H_2O$. In the gaseous state, however, they claim that N_2O_3 does not exist but dissociates into NO and a mixture of NO_2 and N_2O_4 , the N_2O_4 , they assume, reacting with water as follows: $2N_2O_4 + H_2O = 2HNO_3 + N_2O_3$. Williams and Smith (vide supra)

say that "it is stated in chemical works that this gas (N_2O_4) acting upon amyl alcohol is broken up into nitrous acid (N_2O_3) and nitric acid." They made a practical test of conditions governing the production of a gas best adapted to making amyl nitrite and found their results agreed with this statement and with those of Ramsey and Cundall; giving also evidence confirmatory of Lunge's assertions. An acid of specific gravity 1.5 gave a low yield of amyl nitrite as would be expected if N_2O_4 were chiefly produced and decomposed into N_2O_3 and nitric acid. Their best results were obtained with acid of 1.35-1.36 specific gravity and this they recommended as best, as would be anticipated from the researches cited above.

E. Rennard (Pharm. Centr., 1874, 236) in a review of methods for making amyl nitrite also considers this method best, but uses starch or sugar for producing the nitrous gas.

CHEMICAL AND PHYSICAL CHARACTERISTICS.

The descriptions of Amyl Nitrite in the various pharmacopœias differ somewhat in details but in most cases do not indicate as great a variation from an absolutely pure product as is actually the case. In view of this it will be of interest here to consider at some length the characteristics of amyl nitrite, its allied nitrites and other possible impurities.

Of the definitions quoted, that of the U. S. P. is probably best as it merely states the percentage strength of the amyl nitrite and does not remark concerning the nature of the impurities.

The B. P. is contradictory as it states that "other nitrites of the homologous series" are present but specifies that amyl nitrite shall be made from amyl alcohol distilling between 127.7° and 132.2° , which excludes homologous alcohols. If this requirement on the alcohol is not observed the other statement will then be true.

Other pharmacopœias give no definition, which tends to give the idea that medicinal amyl nitrite should be a pure substance, especially in view of the boiling-point requirement.

As previously noted the different pharmacopœias give a range of specific gravity from 0.870 to 0.900. D. B. Dott (Pharm. Jour. (3) 9, 172) gives .877 as the exact specific gravity, while Dunstan and Williams (Pharm. Jour. (3) 19, 487) give .874 ($15^\circ/15^\circ$) as the correct figures for pure amyl nitrite. In view of the fact that secondary propyl nitrite has a specific gravity of 0.871; secondary butyl nitrite, 0.874; tertiary butyl nitrite, 0.8715; and iso-butyl nitrite, 0.876, all according to Cash and Dunstan (Proc. Roy. Soc., 49, 314), and there may be present impurities of both higher and lower specific gravity than amyl nitrite, the specific gravity alone is of but little importance and not at all indicative of purity.

The qualitative tests for aldehyde and free acid are of value, especially the latter. Free acid is not liable to be present in well made amyl nitrite immediately after manufacture, but may be generated through decomposition on standing when improperly protected.

As regards the boiling point much variation of statement exists. For example the U. S. P. says: "At about 96° - 99° it boils yielding an orange-colored vapor."

It is uncertain whether this means that a good amyl nitrite begins to boil at about this temperature, or, what seems more obvious, that it distills wholly between these degrees. Furthermore, the vapor of amyl nitrite is colorless when seen in shallow layers, such as the thickness of a distilling flask of half a liter capacity. The orange colored vapors first given off on boiling amyl nitrite are in reality strongly reddish tinted and are simply mixtures of N_2O_3 and N_2O_4 , which are very soluble in amyl nitrite. In distilling amyl nitrite, after these first colored vapors have been driven off, there is no further evolution of a similar character. It is difficult to obtain any amyl nitrite by the nitrous-acid method which will not show a trace of this orange vapor, but it is obtainable with much less difficulty by the sodium nitrite-sulphuric acid method.

Now, as will be seen later, if the amyl nitrite is supposed to distil wholly or in great part between 96° and 99° , we have a demand for an impossible range of temperature for a commercial article. Several pharmacopœias demand the still smaller range of 97° - 99° . On the other hand the B. P. requires that on distillation about 70 percent. pass over between 90° and 100° . This is a rational and wholly attainable standard.

Coming now to statements of various experimenters, we find marked difference in the temperatures given as the exact boiling point of pure amyl nitrite. Balard, the discoverer of amyl nitrite (*Ann. Chim. et Phys.* (3) 12, 318) gives 96° as its boiling point. Umney (*Pharm. Jour.* (3) 1, 422) gives 98° - 99° . Guthrie (*Jour. Chem. Soc.*, 1859, 245) in an article on "Nitrite of Amyl and Its Derivatives" says: "Nitrite of Amyl, when perfectly dry, boils at 99° C. in a glass vessel in contact with platinum wire, under a pressure of 756 mm. A small quantity of moisture depresses the boiling point two or three degrees, apparently by diminishing the cohesion of the liquid." Tanner (*Am. Jour. Pharm.*, 1872, 21) says that, "The portion which distills between 95° and 100° C. is collected as amyl nitrite sufficiently pure for medicinal use." Hilger (*Archiv. d. Pharm.*, 1874, 485) states that it has a boiling point of 94° - 95° . This, and the high specific gravity he assigns (.902), agrees much better with these characteristics of tertiary amyl nitrite as given by Bertoni (*Gazz. Chim. Ital.*, 16,515) (specific gravity .903 and boiling point 92° - 93°) than they do with the statements of other observers on α - and β -amyl nitrites. It appears probable that he may have had a more or less pure tertiary amyl nitrite. For preparing amyl nitrite he recommends the nitrous acid process and collects the distillate from 90° to 95° for use. Greene (*Am. Jour. Pharm.*, 1879, 65) confirms Balard's statement, saying, "It boils constantly at 96° ." Williams and Smith (*Pharm. Jour.* (3) 16, 499), after remarking on the difference in recorded boiling points, say, "Probably 95° or 96° may be the correct point; our experiments rather tend to confirm that temperature as the correct one." Cash and Dunstan (*Proc. Roy. Soc.*, 49,314) give the boiling point of α -amyl nitrite as 97° and β -amyl nitrite at 95° - 96° , the mixture boiling at 96° - 97° , the one being derived from α -amyl alcohol (B. P. 131.5°) and the other from the β - or active amyl alcohol (B. P. 128°). The researches of Dunstan and his associates on amyl nitrite and homologous nitrites are the most complete published and are undoubtedly the most authoritative.

From the above variety of boiling points it is evident that some observers did not have pure material and that the kind of alcohol used, whether active or inactive, even tho well purified, makes a difference in the boiling temperature. Experimental results to be given later tend to confirm the statements of Dunstan.

PHYSIOLOGICAL ACTION.

Any extended discussion of the physiological action of amyl nitrite is out of place here but before entering into the merits of methods of standardizing amyl nitrite as given in the pharmacopœias and elsewhere it will be of interest to consider the physiological effects of amyl nitrite and allied compounds so that we can better judge of the worth of assay methods as indicating medicinal value. In doing this we will quote briefly from the very thorough and painstaking research of Cash and Dunstan on "The Physiological Action of the Nitrites of the Paraffine Series, Considered in Connection with Their Chemical Constitution." (Philosophical Transactions 1893 B, 505-640.) The only account the writer has seen of it in any other place likely to be seen by pharmaceutical chemists is a brief and wholly inadequate abstract in the *Pharmaceutical Journal* (3) 25, 313).

After the discovery of amyl nitrite it was more fully investigated by Guthrie (*Jour. Chem. Soc.*, 1859, 245) who called attention to its power of causing flushing of the face and acceleration of the heart's action. It was considered as little more than a chemical curiosity until Dr. W. B. Richardson brought it to the attention of the British Association for the Advancement of Science in 1863 by a report on the "Physiological Properties of the Nitrite of Amyl" and showed it to be the most powerful known drug for increasing the action of the heart, and in 1864 he extended his investigations. Dr. Lauder Brunton by publication of results of his work in 1867 and 1870 did much toward increasing its use as a medicine. Valuable primarily in diseases of the circulatory system it has been advocated for numerous other affections in which a vascular excitant is desired. In 1888 Brunton and Bokenham (*Pharm. Jour.* (3) 19, 491) while investigating the effect of amyl nitrite on blood pressure found that the B. P. substance was more powerful than an absolutely pure amyl nitrite. This anomalous and unexpected result was explained by the work of Cash and Dunstan as due to the presence of iso-butyl nitrite which they found to be more powerful than the iso-amyl compound.

Their work dealt with ten related nitrites and their comparative action on the pulse and blood pressure is indicated in the following table, the numerals showing the order of activity.

	Sp. Gr.	Boiling Point.	Acceleration of Pulse.	Reduction of Blood Pressure.	Duration of Subnormal Pressure.
Methyl Nitrite.....		12°	1	4	10
Ethyl Nitrite.....		17°	2	2	9
Primary Propyl Nitrite...	0.895	48°	3	1	1
Secondary " " ...	0.871	39.5°	4	10	2
Primary Butyl " " ...	0.911	76°	5	3	5
Secondary " " ...	0.874	68.5°	6	8	6
Tertiary " " ...	0.8715	63°	8	9	7
Iso-Primary " " ...	0.876	67°	7	7	3
α-Iso-Amyl " " ...	0.874	97°	9	5	4
β- " " " ...	0.874	95-96°			
Tertiary Amyl " " ...	0.890	92°	10	6	8

Having demonstrated the action of these nitrites they say: "In conclusion, the following are the principal facts which have been established with reference to the connection between the various phases of the physiological action of these nitrites and their chemical constitution.

In respect of all phases of the physiological action, the secondary and tertiary nitrites are more active than the corresponding primary compounds. This is to be chiefly attributed, not to the direct physiological effect of the secondary and tertiary groups, but to the great facility with which these compounds suffer decomposition.

In respect of the acceleration of the pulse, the power of the nitrites varies directly as their molecular weights, and they therefore fall into an order identical with that of the homologous series. This same relationship, increase of activity corresponding with rise in molecular weight, may also be traced, though less uniformly, in their power of reducing blood pressure and of inducing muscular contraction.

This order appears to be the result, not so much of the direct influence of the substituted methyl groups, as of the increased chemical instability which their substitution confers on the higher members of the series.

In respect of the duration of subnormal pressure, as well as of the rapidity with which muscular contraction ensues, the activity of the nitrites is expressed by an order which is for the most part the reverse of that presenting their power in accelerating the pulse, reducing blood-pressure, and contracting muscular fibre, this order being in general contrary to that of the homologous series. In these respects the more volatile nitrites of low molecular weight, and containing, therefore, relatively more nitroxyl, are the most active. It is probable that these simple nitrites more readily attach themselves to constituents of blood and muscle, and thus act more quickly than the higher compounds in inducing muscular contraction, whilst their greater stability causes their effect, i. e., reduction of blood-pressure, to endure for a greater length of time than that of the higher and more easily decomposed bodies."

Besides the effect of these homologous nitrites, which is quite similar to that of amyl nitrite, we have that of numerous oxidation products. Thus we may find valerianic aldehyde, valerianic acid, amyl valerianate, nitropentane and unknown products which have the power even in minute quantity of producing violent and lasting headache. We shall also show later that pyridine nitrate is produced by the nitrous acid process and its presence may be expected. This makes it probable that the unknown bodies mentioned above may be pyridine derivatives. Hydrocyanic acid is mentioned by some, while others report that they are unable to find it. While we have made no extended examination for HCN, we have found no reason for concluding it was present in amyl nitrite of the nitrous acid process. Considering the poisonous properties of the pyridine compounds however, it is obvious that crudely prepared amyl nitrite may be extremely deleterious.

METHODS OF VALUATION.

Several methods of assay have been proposed but the most practical for pharmaceutical use is the nitrometer method first proposed by Allen for spirit of nitrous ether and subsequently applied by him to amyl nitrite. This is adopted in both the U. S. P. and B. P. (To be continued.)

OUR NEW OFFICERS.

CASWELL ARMSTRONG MAYO, PH. G.,
SIXTY-SECOND PRESIDENT, AMERICAN PHARMA-
CEUTICAL ASSOCIATION.

Caswell Armstrong Mayo, who was installed as the sixty-second President of the American Pharmaceutical Association on Saturday, August 29, 1914, at the conclusion of the Detroit meeting, was born in Columbus, Miss., July 5, 1862. He received his early education and his preliminary training in pharmacy in his native town. He was graduated from the Philadelphia College of Pharmacy in 1887, while employed in the pharmacy of William Procter, Jr., Company. He was assistant editor of the Druggists' Circular for a little over five years, editor of the Drug Department of the Oil, Paint and Drug Reporter for about a year, editor of Merck's Market Report for three months, in 1892, and succeeded Dr. Frederick A. Castle and Dr. Charles Rice as editor of the American Druggist, with which the Pharmaceutical Record was consolidated on the death of its editor, Prof. P. W. Bedford. Mr. Mayo has attended every meeting of the Association since 1888, with two exceptions, and has taken an active part in its affairs. He served for seventeen years as Chairman of the Committee on Transportation and on numerous other committees, and has been Historian, Chairman of the Section on Historical Pharmacy, Secretary of that Section, Member of the Council, and a Vice-President of the Association. He is a widower, and resides with his four children in Brooklyn, N. Y.

WILLIAM BAKER DAY, PH.G.,

THE NEWLY-ELECTED SECRETARY OF THE
ASSOCIATION.

In the selection of Professor W. B. Day as its General Secretary the Association has made a wise and an admirable choice. Becoming a member of the Association in 1895 he has done yeoman work in its behalf. In every position to which he has been appointed by the Association he has shown eminent ability and capacity, and he may be depended upon to give to the organization the same loyal service in the high and responsible position to which he has been chosen.

As past President of the Association he brings to the position a full knowledge of its duties, and is a most worthy and fitting suc-

cessor of Procter, Parrish, Maisch, Remington, Caspari and Beal. In his hands every member may be assured that the traditions of

the office will be fully maintained and that the affairs of the Association will be carried on with dignity, zeal and faithfulness.

CONVENTION ENTERTAINMENTS.

The Entertainment Committee, under the Chairmanship of Mr. O. W. Gorenflo, assisted by a Ladies' Committee, consisting of Mesdames Webster, Rennie, Mann, Mason, Scoville, Hall, Weaver, Francis and Stevens, were indefatigable in their efforts to make the meeting most pleasurable to every person in attendance.

On Monday evening the magnificent ballroom and the adjacent rooms was the scene of a most enjoyable occasion, that of the Presidents' reception and ball. In the receiving-line were President and Mrs. Beringer and the past Presidents of the Association with their ladies, and also the President of the Michigan State Pharmaceutical Association, Mr. D. G. Look. The rooms were thronged with a large and fashionable gathering until a late hour.

The ladies' excursion, given by the firm of Nelson, Baker & Co. was a most delightful function. The ladies were taken to Bois Blanc Island (Bob-Lo) where they were en-

THE CONVENTION AT THE PARKE, DAVIS AND CO.'S LABORATORIES.

THE CONVENTION AT THE PARKE, DAVIS AND CO.'S LABORATORIES. (2)

THE CONVENTION AT THE PARKE, DAVIS AND CO.'S LABORATORIES. (3)

tertained until a late hour, and where a fine dinner was served in unexceptionable style.

On Wednesday the alumni of the different colleges represented at the Convention met at luncheon together, the most elaborate of the functions being that of the Philadelphia College of Pharmacy at the Hotel Pontchartrain, at which Mr. Frank G. Ryan, the President of the Parke, Davis Co., acted as host. The Massachusetts College of Pharmacy Alumni held their lunch at the Hotel Ste. Claire, under the presidency of Mr. F. W. Archer.

Wednesday afternoon a card-party for the ladies was held in the parlors of the Hotel Pontchartrain, at which Mrs. H. M. Whelpley and Mrs. George M. Andrews were the prize-winners.

Wednesday evening the ladies were the guests of F. F. Ingram & Co. and F. A. Thompson & Co. at the Temple Theatre, while the gentlemen were being entertained most royally at the Wayne Gardens by Frederick Stearns & Co.

On Thursday afternoon, Parke, Davis & Co. entertained the entire Convention with a steamer-excursion to St. Clair Flats, which trip also included an inspection of the magnificently equipped laboratories of the firm. Supper was served on the boat and the party did not return until a late hour in the evening. The excursion through the Flats was one long to be remembered by those who participated in the trip.

Friday afternoon a general auto-ride was enjoyed by all those who desired, and the party was taken through the residential section of Detroit, along its beautiful boulevard, and to beautiful Belle Isle, probably one of the most magnificent public parks in America. Its Zoological Gardens and Aquarium were most enjoyable points of interest for all who participated in this excursion. It is but fair to say that the completeness with which every detail of these various functions was carried out, deserved and received the warmest encomiums of every person who participated in them.

*In Detroit Life Was Worth
Living Every Day.*

Proceedings of the Local Branches

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Acting Editor on the day following the meeting, if possible. Minutes should be *plainly* written, or typewritten, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

<>

CINCINNATI.

The Outing Committee of the Cincinnati Branch, A. Ph. A., planned for a delightful day at White Villa, Ky., about eighteen miles from Cincinnati.

Nearly every member with their families attended and enjoyed a good chicken dinner, games, boating, bathing and a good time generally in the coolness and shade of White Villa, as the guests of mine host, Mr. J. M. Myers. There were speeches by President E. H. Thiesing, Frank H. Freericks, National Delegate; C. T. P. Fennel, Theo. D. Wetterstroem, Charles Harding, Fred Ott and others.

The first prize in the ladies' guessing contest, for guessing the nearest number of Jequirity beans, prayer beans and jumble beads, contained in a jar, went to Miss Lula Faller, the second to Mrs. Frank H. Freericks and the third to Mrs. Otto Kistner.

Prizes also offered, guessing the weight of entire package, resulted: First prize, Mrs. Scallan; second prize, Mrs. Jackson; third prize, Miss Helen Heister.

The lady guessing the nearest number of polka dots in a polka-dot bow was Mrs. Freericks for first prize; Mrs. Kotte, second prize, and Mrs. Vocke, for third prize.

Sugar-coated pellets, contained in a jar, were nearest estimated in number by Mrs. Kistner, for first prize; Mrs. Weissmann, for second prize, and Miss Heister, for third prize.

The geography game resulted in the first

Cincinnati Branch
American Pharmaceutical Association
White Villa, Ky.
July 14, 1906

prize being awarded to Mrs. Dorn; second prize to Mrs. Fennel, and the third prize to Mrs. Julius Greyer.

The Committee in charge for the day were Messrs Charles G. Merrell, Chairman, Frank H. Freericks, C. T. P. Fennel, Otto Katz and Louis Werner.

Everybody voted to have spent an enjoyable day, due to the untiring efforts of this Committee.

Our Local Branch has a steady, healthy growth in membership, and will resume regular monthly meetings in October.

CHARLES A. APMEYER, Secretary.

College and Society

THE COLLEGE OF PHARMACY, STATE UNIVERSITY OF IOWA, IOWA CITY, IOWA.

Professor R. A. Kuever and Miss Ruth Wilburta Hindman of Iowa City were married at the house of the bride's mother, Mrs. Charles Baker, on June 20th. Professor and Mrs. Kuever spent a month in the mountains of Colorado and are moving into a fine new bungalow, which Professor Kuever built this last spring.

Mr. Thurston J. Long, Ph.G., '13, Ph.C., '14, of Iowa City, has just received an appointment as assistant drug analyst and inspector, under State Food and Drug Inspector Guy G. Frary of Vermilion, S. Dak.

The State University of Iowa opens on September 21, and the slogan "3000 in September" is sure to be realized, if advance registration can be taken as an indication. The advance registration to date of the College of Pharmacy is the largest in the history of the College, with but one exception.

Mr. Karl Kullman, Ph.G., '13, received his degree of Pharmaceutical Chemist at the Summer Session Commencement. Mr. Kullman will do relief work for the Hansen Drug Co. of Davenport, where he made good last summer in the same capacity. He will return to the University to continue his studies the coming year.

Miss Maud Wieland, Ph.G., '14, who is clerking for E. L. Boerner, was called to Red Oak by the death of her father.

Dr. E. W. Rockwood, Professor of Chem-

istry, and family are spending their vacation in Colorado.

The annual "Home-coming Day" for the University has been set for October 24th, the date of the Minnesota foot-ball game at Iowa City. For the home-coming Pharmacists, special lectures on Salesmanship and Store Management will be arranged.

Iowa City and the College were represented at the American Pharmaceutical Association Meeting at Detroit by Professor Kuever, Professor Zada M. Cooper, Mr. E. R. Utterback of the Whetstone Pharmacy, and Dean Wilber J. Teeters, wife and son Otis.

An important action was recently taken by the Educational Board by which, in September, 1915, a High School diploma will be required for entrance to the College of Pharmacy. For the present year, two years of high-school work is accepted.

The Pharmacy College, having placed an early import order, has received the entire shipment, so will experience no inconvenience for lack of apparatus this coming year.

Homer Long, Ph.C., '14, chemist for the Boerner Fry Co. of Iowa City, will continue his chemical studies in the University.

Professor B. Shimek of the Botanical Department has been lecturing in Bohemia, and fear is expressed that he may not be able to return in time for his school work.

Mr. George L. Parsons, '12, of Keokuk, Iowa, has invented a powder-dividing device and will put it on the market.

UNIVERSITY OF ILLINOIS SCHOOL OF PHARMACY.

Mr. A. H. Clark, Assistant Professor of Chemistry in the University of Illinois School of Pharmacy, will spend the coming year at the University of Michigan, pursuing advanced studies. His position in the University of Illinois School of Pharmacy has been filled by the appointment of Mr. E. V. Lynn of the University of Wyoming. Mr. Lynn holds the degrees of Bachelor of Arts from the University of Washington and Master of Arts from the University of Wisconsin. He has been Assistant in Chemistry in the University of Washington and in the University of Wisconsin. He was, at one time, instructor in Physics at the Adelphia College. He is the author of a Laboratory Guide in Pharmaceutical Technique, which was prepared during his connection with the Pharmaceutical

Faculty of the University of Wisconsin. His latest work has been in connection with research on the poisonous (to stock) plants of Wyoming.

<>

ST. LOUIS COLLEGE OF PHARMACY.

The Semi-Centennial of this institution will be celebrated early in November and it is desired by the officers of the College that every matriculant of the school shall participate in the celebration of this anniversary. All persons who have ever been connected with the school in any capacity are earnestly requested to send their names and addresses to Mr. Fred W. Sultan, 112 No. Second St., St. Louis, Mo., the Chairman of the Semi-Centennial Committee, who will be pleased to send further information to them regarding the exercises planned for this occasion, so full of interest to all friends of the College.

<>

THE WOMEN'S PHARMACEUTICAL ASSOCIATION OF THE PACIFIC COAST.

The regular monthly meeting of the Women's Pharmaceutical Association was held in San Francisco, July 24, 1914.

Delegates to the sixty-second annual convention of the A. Ph. A. were appointed as follows: Miss Clarissa M. Roehr, San Francisco; Dr. Josephine Barbat Winslow, San Francisco, and Mrs. K. K. Voluntine, Palo Alto.

The next meeting of the Association will be held in San Francisco, August 28, 1914.

Council Business

COUNCIL LETTER No. 20.

(Previously omitted.)

Philadelphia, Pa., May 19, 1914.

To the Members of the Council:

Motions No. 32 (Organization of San Francisco Branch, A. Ph. A.), and No. 33 (Appointment of Harry B. Mason as Chairman of Committee on Commercial Interests, vice Gus Lindvall, resigned), have each received a majority of affirmative votes.

The following communication has been received:—

"American Pharmaceutical Association:

Gentlemen:—Recognizing the importance of having a uniform shape for hypodermic tablets, it is our purpose to conform to the suggestions as outlined by your Association, in using the coffin-shaped mold for bichloride tablets.

Very truly yours,
H. K. Mulford Company,
Milton Campbell, President."

Philadelphia, April 27, 1914.

The following letter has been received:—

"Detroit, Mich., May 16, 1914.

Mr. Joseph W. England, Secretary of the Council, American Pharmaceutical Association:

Dear Sir:—At the suggestion of yourself, as Secretary of the Council of the A. Ph. A., I advance herewith a set of general principles for the consideration of the Council. The annual meetings of the association have grown so confusing and unsatisfactory that it seems to me the time has come to make radical changes. A little of the modern spirit of "scientific efficiency" is critically needed. We must cut out a lot of unessentials in order to find time for essentials.

Some of the propositions advanced in this letter may, if adopted, mean changes in the by-laws, or other formal action, but this is a detail which may be attended to later on. The first thing to do, it seems to me, is to act on the general principles involved, though it may be well to defer action on them until the Detroit meeting in August.

The central purpose behind all my recommendations is threefold in character: First, to get order out of chaos in the growing multiplicity of convention business; secondly, to get rid of unimportant things so as to find time for important ones, chiefly the more leisurely reading and discussion of good papers; thirdly, to so arrange the work that the members will not be worn out by being on duty from nine o'clock in the morning until one or two o'clock the next morning.

1. Abolish the Section on Pharmacopœias and Formularies, and let the work be done by other sections.

2. Discountenance the proposed Section on Materia Medica and Pharmacognosy.

3. Omit the addresses of welcome at the first general session, and start business with the president's address exactly as is done in the Sections.

4. Recognize the Report on the Progress of Pharmacy as being invaluable, but print it and give it no place at all on the programme of the meeting.

5. Adopt the general principle, indeed, that committee reports should for the most part be printed in the JOURNAL or rendered to the Council, or both, but eliminated from the annual meetings.

6. Have the Conference of Faculties and the Association of Boards meet either late the week before, or early the week following the A. Ph. A. itself, so as to avoid this ele-

ment of confusion and scattered interest. Or perhaps use some of the evenings for these bodies.

7. Observe in the future the principle adopted for the Detroit meeting, namely, that the Council shall hold all its meetings in the evening except the opening session on Monday morning.

8. Start the Section work promptly in the morning at 9:30—a step that is eminently practicable with the meetings of the Council relegated to the evenings.

9. Confine section and association meetings rigidly to the morning and afternoon periods, and thus leave the evenings free, so far as the great bulk of the membership is concerned, for rest, recreation and social intercourse. Those who desire, however, can then have the evenings for voluntary conferences, college reunions, and auxiliary activities of one kind and another not properly a part of the association business.

10. Adopt the general principle of concurrent meetings of the sections, and extend it so far as may be necessary to produce the best results. This means, however, that the section work must be better co-ordinated in the future than it has been in the past. Members sitting in one room should know precisely what is going on in another room at the same time. To this end the use of blackboards should be adopted, and entry should be made on them from minute to minute as the business changes.

11. Another cardinal necessity along this line is a collective programme containing the detailed programmes of all the different sections, and indicating approximately when any given paper is coming up for attention.

12. Still further to co-ordinate the work of the sections, and particularly to assist in arranging for discussions, the plan should be revived of having all papers printed in advance of the meeting.

13. A rule should be adopted that all manuscripts must be received by some arbitrary date, say July 15.

14. By these arrangements time and opportunity will be permitted for the discussion of papers read before the different sections, and this is a principle that must always be held uppermost. In the past, debate has been almost impossible, whereas well-planned and executed discussions of live subjects are perhaps the most profitable and interesting feature of the entire convention.

15. Finally, in order to insure the right kind of papers, all manuscripts should be sent by the section chairmen to the general secretary. The latter should have authority to reject or reassign contributions, and with the material before him he should prepare a united programme covering the entire meeting.

Very truly yours,

HARRY B. MASON."

The subject matter of Mr. Mason's letter is of the greatest interest. It is, in effect, a plea for the conservation of the time and the sys-

tematization of the work of the annual meetings, so that the most efficient results may be obtained.

The members of the Council are requested to give the subject their earnest consideration, and to discuss it in the Council letters, so that prompt action can be taken at the Detroit meeting.

In view of its importance, it might be well to make the subject one for special consideration at the first meeting of the Council on Monday, August 17, 1914.

Motion No. 34 (Election of Members). You are requested to vote on the following applications for membership:—

No. 124. Albert K. Jensen, 122 E. 20th St., Cheyenne, Wyo., rec. by Raymond Tyson and H. M. Whelpley.

No. 125. Frank A. Griebing, 3605 W. 32d Ave., Denver, Colo., rec. by F. J. Lord and Wm. A. Hover.

No. 126. Carl Eugene Schoder, 913 Corona St., Denver, Colo., rec. by F. J. Lord and F. W. Nitardy.

No. 127. Charles Howard Stocking, 540 Chautauqua Ave., Norman, Okla., rec. by A. B. Stevens and W. S. Hubbard.

No. 128. Edward A. Tupper, 800 10th St., South Minneapolis, Minn., rec. by E. L. Newcomb and F. J. Wulling.

No. 129. Frank U. Hammett, 2630 Pine St., St. Louis, Mo., rec. by J. W. Mackelden and Arthur C. Schulte.

No. 130. John E. Norman, 71 W. 9th Ave., Columbus, rec. by Edward Spease and Clair A. Dye.

No. 131. Ray Robert Chamberlain, 205 Main St., Malvern, Ark., rec. by Francis George Schachleiter and H. M. Whelpley.

J. W. ENGLAND,

Secretary of the Council.

415 N. 33d Street.

COUNCIL LETTER No. 31.

Philadelphia, Pa., August 15, 1914.

To the Members of the Council:—

The following communication has been received:—

"Detroit, Mich., U. S. A., August 11, 1914.

Mr. Joseph W. England, Secretary, Council of the A. Ph. A., 415 North 33d St., Philadelphia, Pa.:

Dear Sir:—Several months have now gone by since I submitted to the Council several propositions looking toward the reform, simplification and improvement of our annual meetings. The subject has since been considered and discussed so generally that I think we are ready for final decision and action. I have a motion to make, but first I should like to restate briefly the principles which I think should be adopted in the interests of increased efficiency.

First, let me say that the local Committee of Arrangements has, on its own initiative, decided to introduce several reforms at the Detroit meeting:

1. The customary addresses of welcome, and responses thereto, will be omitted at the first general session, and business will at once be started with the President's address exactly as is done in the sections.

2. At the suggestion of the Local Committee, the Council has already decided to hold its meetings in the evening with the exception of the opening session on Monday morning.

3. The section work will start promptly in the morning at 9:30—a step that is eminently practicable with the meetings of the Council out of the way during that period.

4. The section and Association Meetings will be rigidly confined to the morning and afternoon periods, thus leaving the evenings free, so far as the great bulk of the membership is concerned, for rest, recreation and social intercourse. Those who desire, however, can have the evenings for voluntary conferences, college reunions and auxiliary activities of one kind and another not properly a part of the Association business.

5. The principle of concurrent meetings of the sections has been extended more than ever before, and it has been arranged to co-ordinate the section work by a system of blackboards on which entries will be made from minute to minute, showing precisely what is going on in the different sections at the same time.

Although the foregoing innovations have already been adopted for the Detroit meeting this year, it seems to me that resolutions of approval should be passed by the Council for the guidance of future committees and for the permanence of these reforms.

Other necessary changes are the following:

6. Abolish the Section on Pharmacopœias and Formularies, and let its work be done by other sections.

7. Discountenance the proposed Section of Materia Medica and Pharmacognosy.

8. Recognize the report on the progress of pharmacy as being invaluable, but print it and give it no place at all on the program of the meeting.

9. Adopt the general principle that the reports of standing and special committees should be presented to the Council as the board of directors or executive committee of the organization, and by the Council referred to the Association only when it deems such action necessary. Inasmuch as no resolution or other formal action of the Council can be made binding until it is referred to and approved by the Association, there is no danger here of oligarchic government.

10. The manuscripts of all section papers should be received at least four weeks before the annual meeting.

11. All manuscripts should be sent by the section officers to the General Secretary, who should have power to reject any of them or to reassign them to different sections.

12. The General Secretary should have all accepted manuscripts printed in advance of the meeting. Their publication may still be limited to the official JOURNAL if so desired.

13. With all manuscripts in hand, three or four weeks before the meeting, the General Secretary should prepare a collected program containing the detailed programs of all the different sections, and indicating approximately when any given paper is coming up for attention.

14. Have the Conference of Faculties and the Association of Boards meet either late the week before, or early the week following, the A. Ph. A. itself, so as to avoid this element of confusion and scattered interest—either that, or else let these bodies use the evenings for their sessions.

With this spirit of elimination, co-ordination and increased efficiency in active play, it would easily be possible, as Mr. Wilbert has suggested, to confine the meeting to four days. This, however, would do away practically with all entertainment, and I do not feel like recommending such a radical step. Would the Association as a whole prefer a four-day program of solid work, or a five- or six-day program with a few entertainments sprinkled in? Why not leave the settlement of this particular question until it has been put to a vote by mail of the entire membership?

Now for my motion:

Some of the foregoing propositions, if approved, will mean changes in the by-laws. Others will merely mean resolutions or similar action. To simplify matters, however, I move that the whole subject of A. Ph. A. reform be made a special order of business at the meeting of the Council at 8 o'clock on Tuesday evening, August 25; that any germane recommendations that may be found contained meanwhile in the President's address or in any committee report be considered at the same time; that the Council vote 'yes' or 'no' on the general principles involved, or on any desired modification of

them; that a committee of three then be appointed to carry out the will of the Council and submit the approved propositions in the form of resolutions, changes in the by-laws, or what not; and that this report be rendered at the meeting of the Council on Wednesday evening, August 26.

It will thus be possible to clear up this whole matter with celerity, refer it to the Association, and get it disposed of finally during the week of the Detroit meeting.

Very truly yours,

HARRY B. MASON.

P. S. I submit purposely as a postscript three suggestions which I am not prepared to make as recommendations.

They have been advanced by others, and I think it might be well to consider them at the same time and thus clear up the whole atmosphere:

1. Abolish the House of Delegates and let the Council take over its work.
2. Abolish the Historical Section.
3. Change the Women's Section to an auxiliary."

'Do you favor above motion? It will be regarded as *Motion No. 48 (On special order of Business for Council Meeting of August 25, 1914).*

J. W. ENGLAND,
Secretary of the Council.

415 N. 33d Street.

The Pharmacist and the Law

AGENCY CONTRACT—LIABILITY OF AGENT.

A contract between a medicine company and an individual required the company to ship proprietary medicines to the individual for sale at retail, and bound him to sell at prices fixed by the company, to remit each week one-half of the receipts of the business, to submit weekly reports of the business, and on the termination of the contract settle in cash for the balance due the company on account. In an action by the receiver of the medicine company it was held that the contract was not a contract of sale, but an agency contract, and the individual paying the half of the receipts for goods sold was not liable for the value of goods in his possession at the termination of the contract.

Davis v. Woolsey, South Dakota Supreme Court, 147 N. W. 977.

LIABILITY FOR EXPLOSION.

Action was brought for personal injuries caused by the explosion of a cylindrical tank containing liquid carbonic acid gas. The tank was on the premises of the defendant, a drug company, when it exploded, and the plaintiff was working on the floor above. It was held that the mere fact of the explosion of the tank upon the defendant's premises was not sufficient to charge it with negligence. There must be some evidence that the tank was at the time of the explosion in the defendant's custody and control. In the absence of such evidence judgment was entered for the defendant.

Conley v. United Drug Co., Massachusetts Supreme Court, 105 N. E., 975.

<>

SALE OF LIQUOR—PRETENDED DRUGGISTS.

On appeal from a conviction of a violation of the local option law it appeared that the two defendants were partners in business as pseudo-druggists; neither had a license as a pharmacist, nor did they have a pharmacist in their employ. They employed a retired physician, and under what they claimed was a prescription written by him a sale was made of a quart of whisky. The sale was made by one of the partners in the defendant's store. The evidence was contradictory as to whether the other defendant was present, and there was no evidence that the sale was contrary to his wishes or instructions. It was held that, the defendants not having a pharmacist's license, and having no licensed pharmacist in their employ, they were not druggists and had no right to sell whisky on a prescription or without it. Every sale of whisky made by them was unlawful. The very nature of the partnership, so far as the sale of liquor was concerned, was a conspiracy to violate the law, and under these circumstances each was liable for a sale made by the other.

State v. O'Kelly, Missouri Supreme Court, 167 S. W., 980.

<>

CONTRACT OF SALE FOR CASH—INSPECTION OF GOODS—BUYER'S REMEDIES.

The contract of sale of a showcase stipulated, "Terms net cash. All terms mean from date of shipment, and not from date goods are received," and provided that, if goods were not up to contract, the seller might en-

ter on the buyer's premises and remove the same, and that a retention of the goods for ten days by the buyer without complaint was an acceptance, and a conclusive admission of the representations made by the seller. It was held that this did not prevent the seller from requiring the buyer, through draft, with bill of lading attached, to pay for the goods before obtaining possession. Where the buyer paid the draft and took possession of the goods, he had ten days within which to examine them. If during that period he discovered that they did not comply with the contract, he might complain to the seller, and either return the goods and demand the price, or he might keep them and sue for breach of warranty.

Eason Drug Co. v. Montgomery Showcase Co., Alabama Supreme Court, 65 So. 345.

MISBRANDING OF INSECTICIDE.

In proceedings for the condemnation of insecticide labeled "Sulpho-Naphthol" and "Inert Substance Water 7%, Insecticide 93%," it was held that the product was misbranded for the reason that it contained less than four-tenths of 1 percent of sulphur, the presence of which was due to chemical or accidental impurities, although the usefulness of the article was not affected, and also because it contained as much as 10.5 percent of water. A manufacturer, it was held, may not give to his product a name which indicates the presence in it in substantial quantities of a constituent when such is not the fact. *Libby, McNeill & Libby v. United States*, C. C. A., 210 Fed. 148. The manufacturer of the product expressed itself as willing to consent to a decree of condemnation. It did not wish to put out its product under a name which could lead any reasonable person to believe that he was getting something other than he was. It was willing to adopt another name, and in some way convey the information that the article, heretofore called sulpho-naphthol, does not contain any appreciable quantities of sulphur or any sulphur derivative.

United States v. Two Cases of Sulpho-Naphthol, 213 Fed. 519.

TAXATION—ADVERTISING PATENT MEDICINES.

Appeal was made from a conviction for an alleged violation of section 2 of chapter 90

of the Mississippi Laws of 1912, by which a tax of \$150 is imposed on "each person, firm or corporation selling or advertising by harangue, in any town or city, patent medicines, except a licensed merchant or druggist selling from his place of business." The appellant sold a lot of patent medicine to the Marks Drug Company, either a corporation or a partnership, engaged in the sale of drugs in the town of Marks, Miss., having a regular place of business, and agreed, as a part of the consideration for the purchase thereof, that he would assist the company in advertising and introducing it. This he did in the following manner: A platform was erected in front of the company's store on which the appellant would stand, accompanied by a negro with a banjo. This negro would attract a crowd by playing his banjo, singing, and telling stories, and the appellant would then make a speech telling the crowd of the great benefits to be derived by them from the use of this medicine, which they could purchase from the Marks Drug Company. He would then invite the crowd to follow him into the store. After the crowd would congregate in the store, sales of the medicine would be made to the members thereof by employees of the drug company. It was held that, as it appeared that the appellant, in advertising this medicine, was acting for the Marks Drug Company, which company had the right to have its medicine so advertised if it desired to do so, no crime was committed.

Hass v. State, Mississippi Supreme Court, 65 So. 502.

VIOLATION OF LOCAL OPTION LAW—SUFFICIENCY OF EVIDENCE.

The proprietor of a drug store was indicted for selling intoxicating liquor to one Brown without having a license and in violation of the local option law. Brown was the only witness for the State and defendant the only witness for himself. Brown testified that he made one purchase of a quart of whisky from the defendant's clerk in charge of his drug store, without having a prescription for it. He was indefinite as to the date, but stated that it was about the middle of the winter of 1912 and 1913 and during the defendant's absence; he thought while the defendant was out of town. The defendant testified that he was absent in Arkansas from the first week in February to the first week in March, and

that he never heard of the sale in question until after the indictment; that he never authorized his clerk to make a sale; on the contrary, had directed him not to sell liquor without a written prescription from a physician. This was all the evidence, except that between five and six years before the sale, and before the adoption of the local option law, he had pleaded guilty to selling liquor without a license. On appeal, it was held that the evidence was insufficient to authorize a conviction.

State v. Walls; Mo., 167 S. W. 1160.

LIENS FOR WAGES.

The prescription clerk and porter of a drug store, the stock in which had come into the hands of a receiver, filed a petition for the establishment of a preferred lien for employee's wages given by Tennessee Acts 1897, c. 78, as amended by Acts 1905, c. 414. The property was described as "the drug business at the corner of C. and M. Avenues in Memphis, Tenn." There were other prior liens on part of the fixtures. It was held that the petition was properly denied, as it should have described the property specifically, with a statement of the nature of the lien, or an attachment should have been issued and levied.

Hessig-Ellis Drug Co. v. Stone, Tennessee Supreme Court, 167 S. W. 864.

UNITED STATES PUBLIC HEALTH SERVICE.

List of Changes of Stations and Duties of Commissioned and Other Officers of the United States Public Health Service.

Sanitary Chemist H. C. Colson. Directed to proceed to Luray, Va., and take charge of the experimental plant constructed by the Service for the investigation of tannery wastes. August 8, 1914.

Surgeon C. W. Vogel. Directed to proceed to Philadelphia, Pa., for conference with health authorities with reference to organization of campaign against rodents. August 21, 1914.

Pharmacist F. A. Stump. Relieved from duty at Honolulu, Hawaii, and directed to proceed to Chelsea, Mass., and report to the medical officer in charge of the Marine Hospital for duty and assignment to quarters. August 24, 1914.

Official: (Signed) RUPERT BLUE,
Surgeon-General.

Surgeon W. J. Pettus. Directed to proceed to Liverpool, Eng., for duty in connection with sanitation of vessels in plague precautionary measures. August 13, 1914.

Surgeon S. B. Grubbs. Directed to proceed to Mobile, Ala., on request of health authorities, for duty in connection with rodent extermination campaign. August 14, 1914.

Passed Assistant Surgeon A. D. Foster. Granted two days' leave of absence from August 15, 1914, on account of sickness. August 17, 1914.

Passed Assistant Surgeon F. A. Ashford. Granted one month's leave of absence from August 17, 1914. August 12, 1914.

Passed Assistant Surgeon Lawrence Kolb. Granted one month's leave of absence from August 27, 1914. August 12, 1914.

Assistant Surgeon W. F. Draper. At the request of the Office of Public Roads, Department of Agriculture, detailed to make an investigation of the sanitation of convict camps in the states of Colorado, Utah, Oregon, Washington, Wyoming, and such other states as the office may direct. August 17, 1914.

Assistant Surgeon G. A. Kempf. Granted seven days' leave of absence from August 6, 1914, under paragraph 195, Service Regulations. August 5, 1914.

Pharmacist E. B. Scott. Granted six days' leave of absence from August 10, 1914. August 5, 1914.

Pharmacist G. A. Morris. Detailed to represent the Service at the meeting of the American Pharmaceutical Association to be held at Detroit, Michigan, August 24-29, 1914. August 13, 1914.

Assistant Epidemiologist F. E. Harrington. Directed to proceed from Cambridge, Md., to New Albany, Miss., for duty in investigations of rural sanitation. August 12, 1914.

Technical Assistant M. I. Wilbert. Detailed to represent the Service at the meeting of the American Pharmaceutical Association to be held at Detroit, Mich., August 24-29, 1914. August 13, 1914.

BOARDS CONVENED.

Board of Commissioned Medical Officers convened to meet at the Bureau at the call of the chairman, for the preparation of questions for the mental examination of Pharmacists C. C. Cannon and Ralph E. Knouse to determine their fitness for promotion to the grade of Pharmacist of the Second Class.

Detail for the Board:

Assistant Surgeon-General W. G. Stimpson, Chairman; Surgeon C. C. Pierce, Recorder. August 17, 1914.

Senior Surgeon H. R. Carter and Surgeon J. T. Burkhalter detailed as members of a Revenue Cutter Service, retiring board to meet at Baltimore, Md., by direction of the Secretary of the Treasury. August 18, 1914.

The Sixty-Second Annual Convention

Held at Detroit, Michigan, August 24-29, 1914

SECOND GENERAL SESSION.

President Beringer called the convention to order Tuesday, August 25, at 9:45 a. m., in the Convention Hall of the Hotel Pontchartrain. The records of the first session were read and approved.

The President then stated that Dr. F. A. Wolff, Assistant Physicist, Bureau of Standards, Department of Commerce, was now in attendance, his credentials being presented at the first session, to address the Association upon the relation of his department to the work of the American Pharmaceutical Association.

[In response to this invitation, Dr. Wolff read a paper, which appears on page 1426.]

At the conclusion of the reading of the paper, President Beringer stated that Dr. Wolff had conferred a favor upon the Association in the presentation of his address, and he thought appropriate action should be taken to evidence its appreciation of his courtesy.

Mr. Joseph W. England moved that the thanks of the Association be extended to Dr. Wolff, and that the paper be published in the Journal.

Mr. Mayo spoke of the willingness shown by the Bureau of Standards to coöperate with those endeavoring to advance this work of standardization. Mr. Mayo further suggested that the thanks of the Association be extended to the Secretary of Commerce for his courtesy to the American Pharmaceutical Association.

President Beringer stated that the suggested amendment to the motion would be accepted by the mover. Motion as amended carried.

The Secretary was directed to express the thanks of the Association to the Secretary of the Department of Commerce.

The Chair then called for the report of the Committee on Nominations. Mr. Nitardy then presented the report of the Committee on Nominations, which was as follows:

For President: William C. Alpers, L. D. Havenhill, Wilber J. Teeters.

First Vice-President: Chas. H. LeWall, L. A. Seltzer, D. F. Jones.

Second Vice-President: E. O. Kagy, F. W. Nitardy, E. A. Ruddiman.

Third Vice-President: L. A. Brown, E. N. Gathercoal, C. Osseward.

Council: F. M. Apple, Harry V. Arny, Philip Asher, Edward C. Bent, G. M. Beringer, James O. Burge, Chas. B. Jordan, Andrew Scherer, Robt. H. Walker.

The report was accepted, and President Beringer stated there was no further action to be taken as, according to the by-laws, the election of officers would be conducted by mail.

The Chair then called for the reading of the minutes of Council.

Mr. England then proceeded to read the minutes of Council. (Printed on page 1374.)

Mr. Marshall moved that the minutes of the Council be approved; motion seconded and carried.

The President stated that the Treasurer had raised the question as to the propriety of the Association approving the election of the members that have been elected by the Council by correspondence.

Mr. Whelpley moved that the Association approve the minutes of the Council which have been published in the Journal in the interval between the last annual meeting and this meeting; motion seconded and carried.

President Beringer then called for the Treasurer's report.

Mr. Whelpley, in presenting his report, made the following comments thereon:

"Mr. President and Members: The report of the Treasurer covers the fiscal year 1913, which closed with the 31st day of December. This report is in type and in the hands of the Secretary and the proof will be here today for the use of the pharmaceutical press. It is not likely that you would care to have the dry figures read to you in detail. I will say, in a general way, however, that at this date the American Pharmaceutical Association has not as much money as it had twelve months ago by \$3,307.52. The actual amount on hand in the bank in the current fund is \$5,372.95. This decrease in the cash balance is due to two conditions, increased expenses during the past year, and a decreased income from dues. The decreased income in dues is not caused by a smaller membership, but to the fact that when the present treasurer took hold of this work there was a large number of members who owed for a number of years, some of them for as many as five years. The present policy has been to get the members into the habit of paying for the current year, and we have succeeded in doing so, so that we have collected the outstanding accounts that amounted to more than one year, and that added to the income the year before last, and even the year before that, and has cut down our income during the past twelve months. I trust I have made that point clear to you. Some of the members have spoken to me this morning insisting that I give you some of the experiences of a treasurer, remembering some of

the experiences that I related last year and the year before. Unfortunately, I have nothing particular along that line to report. The membership has fallen into the habit of paying their dues promptly and saying very little about it. (Applause.) So that those extracts from communications that I gave you then are a matter of past, and not current history.

I might say that I recall one communication that I received early in January of this year from a member. I had been in the habit of stamping communications with a large stamp "Second Notice," "Third Notice," and so on, after the first one. This party wrote to me and said, "I surmise that you have a record of my transactions with the Treasurer, and remembering last year, when you sent me six communications, and believing you have prepared a set for this year, I will say 'Please destroy them'; the \$5.00 enclosed is the excuse." (Laughter.) While this member expressed his sentiments, many others enclosed the \$5.00 without expressing theirs.

Let me say that I believe, from the experience I have had with pharmaceutical organizations the country over, that state and local associations can collect their dues for the current year just as well as to allow them to accumulate and thus having members two, three, four or five years in arrears. It is merely a matter of taking hold of the work, just as a business firm does, sending out your statements the first of every month and following them up with personal communications wherever necessary." (Applause.)

[The Treasurer's report was printed in last issue of the Journal.]

The Secretary read the report of the Auditors on invested funds of the Association, and the report was accepted.

The report of James H. Beal, the retiring Secretary and Editor of the Journal was read by the Secretary, and accepted and referred to Committee on President's Address.

[Report printed in the last issue of the Journal.]

Mr. Wilhelm Bodemann moved that the Secretary be instructed to send a word of greeting to Dr. James H. Beal, with the heartiest wishes of the Association for his speedy recovery. The motion was unanimously adopted by a rising vote.

The President called for the report of the Committee on Status of Pharmacists in the Government Service. Chairman William B. Day, of Chicago, presented the report, which was printed in the last issue of the Journal.

The Secretary then moved that the report be received and referred for publication and the recommendation adopted; motion seconded and carried.

The President then called for the report of the Committee on Credentials, which was read to the convention by Mr. Marshall, and referred to the House of Delegates.

The Chair then called for the report of the Committee on Weights and Measures. Chairman Harry V. Army presented the report, which was accepted and the recommendation adopted.

[Printed in last issue.]

The President then called for the report of the Committee on Time and Place of Meeting.

The report of the above committee was read by the Secretary, after which he

stated that in addition to this report the Association had received invitations from the Los Angeles Convention League, the Chamber of Commerce of Chattanooga, the Convention Bureau of the City of St. Louis, the Chamber of Commerce, City of St. Louis, and the Merchants Exchange, St. Louis, with literature relating to the advantages of the different places.

Mr. Henry P. Hynson, of Baltimore, called the attention of the Convention to the invitation from that city, and stated that when the City of Baltimore invites the American Pharmaceutical Association to hold their convention in that city they expect to have the invitation accepted.

Mr. J. F. Hancock, Baltimore, spoke in favor of Atlantic City, and said it was the ideal place for gatherings of this kind; that the American Medical Association has selected Atlantic City as the most suitable place for their meetings; that San Francisco was too far away, and that the most central point, and the most advantageous point without any tax upon the members would be Atlantic City, and therefore moved that Atlantic City be put down as one of the places for consideration.

The President called the attention of the Convention to the invitation received from the New Jersey Pharmaceutical Association to meet somewhere in New Jersey, and asked that the Chairman of the Committee present same to the Convention for its consideration.

A member from Grand Rapids, Mich., stated that he was under the impression that it was understood that the next meeting was to be held in San Francisco, and for that reason Grand Rapids had not presented their invitation; but in the event that the matter had not been decided, he wanted to present Grand Rapids as a place for the next meeting, or at least for 1916.

Mr. Albert Schneider, of San Francisco, said that he thought the Association should meet in San Francisco in 1915; that he had assumed all along that they would do so; that he was delegated by the Exposition, and also by the San Francisco Convention League, as well as the State Association of the State of California, to invite the Association to come to San Francisco in 1915; that he had taken it for granted that the Convention would meet there, and for that reason had not thought it worth while to say much about it.

It was almost impossible for him to tell the Association about all the beauties of California and the desirability of selecting San Francisco as the most suitable meeting place for 1915; naturally most of the members would want to go to San Francisco to attend the exposition.

The speaker further said, in regard to the rumor that the conditions in Europe would affect the success of the exposition, that that was not the impression in San Francisco; that he had been in close touch with officials of the exposition and he was advised there would be no interruption or interference in the proceeding. Most of the countries which have promised to take part in the exposition have stated since the opening of the war that there would be no curtailment in the part that they were to take in the exposition.

Should the Association meet in San Francisco, Mr. Schneider assured the members that they would be well taken care of; that they should not feel for a moment that there are not sufficient accommodations in San Francisco for every one. If

any one should have trouble in getting accommodations and would let him know, he would see to it personally that they were provided for in every way possible. The Association had met at Los Angeles and they know what California was, and some of the members might remember the success of the meeting in San Francisco in 1889. He could assure the members that everything would be done for their comfort; the exposition alone should bring them there, and that the Local Committee had provided that the exposition would not interfere with the business end of the meeting.

Mr. Schneider thought the time of the meeting should be left to the Local Committee; it had been suggested the meeting be held some time in July; this had been proposed because some of the other pharmaceutical bodies were to meet at that time. Mr. Hynson asked if the Secretary would read the recommendation of the Committee. The President stated that the Committee had made no recommendation as yet; that as he understood the report, the report was simply that they had received invitations from Baltimore, New Orleans, St. Louis, San Francisco, Cedar Point, etc.

The President then stated that as Mr. Main was now in the room he would therefore ask for a statement from him.

Mr. Thomas F. Main, of New York, Chairman of the Committee, stated that the Committee had been unable to agree upon a place of meeting and therefore had reported the invitations received without recommendation, adding that since this report was written they had received an invitation from the President of the New Jersey Pharmaceutical Association, in which the Association was invited to meet somewhere in the State of New Jersey, mentioning the fact that either Asbury Park or Atlantic City, which, as every one knew, were seaside places, should be selected.

Mr. Hynson then moved, in view of the inability of the Committee to agree and the international troubles, and the fact that the exposition is to be held in California, that this matter of time and place of meeting be referred to the Council.

The motion to refer the question of time and place of meeting to the Council was lost.

Mr. Gordon then moved that the next convention of the American Pharmaceutical Association be held in Atlantic City, New Jersey, and made the motion for the following reasons: that any one who had been to the last convention of the N. A. R. D. knows how hot it is in the large cities in the summer time. He further said that Atlantic City had a number of advantages which other places would not have: that the railroads make special rates during the summer; that there were any number of hotels and all sorts of rates, and on the new piers there was a magnificent convention hall where the meetings could be held right out over the ocean, where it would be cool and the members would have plenty of time to talk over things; in other words, there was every convenience there. Another thing was that the American Medical Association is to meet there; in fact, meets there regularly. Mr. Gordon thought if the meeting went to San Francisco next year there would be hardly anybody there; that there had not been a meeting of this Association in the East for some time.

Motion seconded by J. F. Hancock.

Mr. Fred J. Wulling, of Minneapolis, stated he was a delegate from the Minnesota State Pharmaceutical Association, which had extended an invitation to this Association a year ago, and who were under the impression that the next meeting was going to be held at San Francisco and that he was here in the name of the Association to stand by San Francisco. He further stated he had no fault to find with Atlantic City; that he knew both Atlantic City and San Francisco and that he liked Atlantic City better than San Francisco because he had had some affiliations there that made him feel that way, but that it appeared to him that the general impression had been that the next meeting was to be held in San Francisco and that nothing had been heard to the contrary in Minnesota. However, if there were any better reasons for going elsewhere than to the place that nearly every one supposes the Association is going, he felt he had done his duty in calling attention to the sentiment in his vicinity.

Mr. John C. Wallace, of Pennsylvania, stated that he heartily agreed with Professor Schneider, but that many of the members of the organization had left the room and he did not believe that snap judgment should be taken upon a report of this importance; that if the Committee were unable to agree, he believed that a vote with as many delegates present as could be secured at the convention be taken, and he knew of no reason why a short session of the general session should not be held previous to Friday morning; that his understanding was that the general session had the right of way at all times, and he therefore moved that this matter be referred to a special meeting of the general session subject to the call of the chair.

Motion seconded by Mr. Hall, and was adopted by a vote of 38 to 19.

President Beringer called for the report of the Committee on Editing Rules. Mr. Mayo, chairman of the committee, reported progress and asked for a continuance. The report of the Chairman was received and the committee continued.

The Chair then called for the report of the Committee on International Pharmaceutical Nomenclature. Mr. Mayo, as chairman of the committee, begged leave to report that the international situation is in such a bad condition that the committee deemed it highly improbable that they could do anything further to bring about an international agreement on anything and therefore asked to be discharged. The meetings scheduled to be held in Europe on August 7 have been called off, and for that reason Mr. Mayo asked that the committee be discharged.

Mr. Mayo's recommendation was adopted.

The Chair then called for the report of the Committee on International Congress of Pharmacy.

Prof. Remington said he thought the President had referred in his address to the meeting last summer at The Hague on the International Congress; that the committee had made a report to the Chairman, which had already been published in the Journal of this Association.

He asked that that report be considered to be the report of the Committee in order to save time, as it sets out all the essential facts. The whole subject of international work at the present time is in such a tangled state that nothing could be done in the way of international work which would be of any value. He did

not believe the International Congress would be held in St. Petersburg, no matter what events the future would bring or which nation or combination of nations won in the European war; he did not believe there would be any opportunity inside of a year to do anything in the way of an International Congress; at least, it did not look so to him; for that reason he thought it wise and judicious at this time to be ready in case the Congress did go on, but thought it useless to look forward to any work of that character at present.

President Beringer asked Mr. Remington if he advised the continuation of the committee, to which Mr. Remington replied, "Yes." Mr. Beringer said he understood the committee was really in the nature of a delegation. Mr. Remington said that was true, but the Council will be able to act in an emergency and do what is proper.

Mr. Hynson asked when the International Congress was to be held and Mr. Remington stated that the International Congress would be held in August, 1915, in St. Petersburg, Russia. That was fixed; and at that meeting he (Prof. Remington) was to make a report which would look forward to making all the chemicals and preparations set out in the pharmacopœias, uniform, as to strength. Prof. Remington did not see how it was possible for such a report to be made now or how affiliation can continue between the associations of the different countries that are at war, and he considered it a very inopportune time to go on with a work of that kind, but, however, the idea was slumbering. He would not advise discontinuing the work, but to leave the matter as it is at present.

There being no objection, the report was received.

The President then read a letter from the Women's Organization of the National Association of Retail Druggists.

WOMEN'S ORGANIZATION NATIONAL ASSOCIATION RETAIL DRUGGISTS.

August 22nd, 1914.

To the American Pharmaceutical Association Assembled at Detroit, Michigan.
August, 1914.

Mr. George M. Beringer, President:—

The Women's Organization of the National Association of Retail Druggists send most sincere greetings to you upon this your 62nd Anniversary.

We congratulate your Association upon the splendid work accomplished in these past years—and at the passing of this milestone we ask for your Association, that many years may keep coming to you with their lessons, their calls, and their needs; and that your hands will be held out to receive them, and your use of them will be such that when you have reached the end of the road it will be said of each man—"he hath done what he could."

Sincerely yours,

MRS. JESSIE F. WATERHOUSE, President.

MRS. NELLIE FLORENCE LEE, Secretary.

The Secretary was then instructed to acknowledge receipt of the cordial greetings from the Women's Organization.

The Secretary then announced that the Detroit Chamber of Commerce, at 12:30, would be addressed by a Mr. Reed on the question of "Our Trade Relations with the South American Republic," and that a cordial invitation had been extended to all members of the Association to attend this lecture.

The Chairman then called for the report of the Committee on Membership. C. Herbert Packard, of Boston, Mass., Chairman of the Committee, read the report of the Committee.

(Printed in last issue.)

Mr. Philip Asher, of New Orleans, moved that the report be received and take the usual course; motion seconded by Mr. Weinstein, of New York, and carried.

The President then called for the report of the Committee on William Procter Memorial Fund. Mr. J. F. Hancock, Chairman of the Committee, made a report. (Printed in last issue.)

Supplementing his report, Mr. Hancock stated that he had some photographs of the model of the proposed monument that he would like to pass down to the members present, and stated further that he wished to give Prof. Remington due credit as it was through his assistance and effort that the Committee secured the assistance of the few gentlemen who are alive who knew Prof. Procter in his lifetime by personal contact, special reference being made to one gentleman in particular who had been a student at the college and who was the most exacting critic of the soft model, which was changed by the sculptor; that it seemed to be the opinion of the critics that it was the best model that could be made. Mr. Hancock further said that he did not believe, nor did the Committee believe that anything better could be done than has been done; that many suggestions had been offered by Prof. Remington, who was his assistant while he was living, and who knew a good deal more about his personality than anybody else, and the sculptor got all the information from him that could be gotten; that the Committee also got from the daughter of Prof. Procter the passport that he received when he went to Europe to attend the International Congress, and that the Committee had done everything it could to get the most exact model of the proposed monument.

The Chairman further stated the money for the monument had been secured, but that it was necessary to have some money in excess of that amount in order to make a formal dedication, and that it was expected a meeting of the American Pharmaceutical Association would take place at the time of, or in the summer of the dedication at Washington. This inspiration came to the Chairman by being present at the dedication and unveiling of the monument to Dr. Probst, the eminent surgeon, which was a very formal, and a very interesting affair on the part of the American Medical Association, and the Chairman thought it the most appropriate thing to have pharmacy represented with medicine in the National Capital, in the Smithsonian Grounds which are the center of science in Washington; that it is well known that Washington will grow more in importance as the country becomes more densely populated; it will be like Rome, all roads will center at Washington, and that is the place for a monument to an illustrious character such as we desire to honor. Mr. Hancock stated further that we should also honor the heroes who were not engaged in war, as well as the heroes who were engaged in war; to honor the heroes who were trying to prevent, rather than those alone who created death and destruction.

Mr. Wallace moved that the report be received and take the usual course. Motion seconded.

Mr. Hancock said that he wished also to say that 19 of the 20 members of the

Committee had signed in favor of the sculptor, Mr. Burge, but the twentieth one stated he did not know the gentleman and did not vote at all.

Mr. Wallace then stated that there was a recommendation contained in the report of the Committee, and asked that for the information of the members present, that the Secretary read the recommendation again.

The Secretary read the recommendation to the Association.

Mr. England then stated that in personal consultation with Mr. Hancock a day or so previous, Mr. Hancock had told him that he hoped to have Congress present the granite base for the monument, and asked if that was provided for in the recommendation. Mr. Hancock said that it was. Mr. England said that if this were not provided for, he would suggest that Congress be memorialized at its next session, to take steps toward that end; that if the Association waited until 1917, it would be 1920 before Congress granted the appropriation.

Dr. Hancock then stated that he thought he had not properly explained the matter. He had taken his ideas from the experience of the American Medical Association in erecting the monument to Prof. Probst; that the Medical profession had had the bronze monument cast, but that the Government had given the base and the ground, after which the monument was transferred to the Government, it being in their hands and keeping, and the Government has appointed a Commission,—a Commission which is very exacting,—to see that nothing shall be placed there that is not in accord with the views of that commission, and so we have secured the approval of this commission.

He further explained that Mr. Burge had made a reputation for himself, having recently placed in one of the squares of Baltimore several monuments, one of which is a monument to Mr. Latrobe, seven times Mayor of Baltimore, which is regarded as an excellent piece of work, and that he will have placed by the 12th of September a monument to the Hero of Fort Henry, when Gen. Ross made the attack on the city in 1814. He had already seen this, and it was a very creditable piece of work, and for these reasons the Committee did not think they were taking much of a chance as they would be doing if they were to take the work of a man who had not had any experience, and who had not already established the character of his work. Mr. Hancock further stated that the sculptor had made a very low bid, and they could not in competition get as low a bid as this, and the reason for this is that to have a manument in Washington would be an advertisement to the sculptor even though he made nothing on the work.

Mr. Wallace inquired if the funds which were to be drawn from the treasury of the American Pharmaceutical Association were exclusively the funds of the William Procter Memorial Fund. President Beringer replied that such was the case, whereupon Mr. Wallace stated that he desired to add to his motion that the report be received and the recommendation attached thereto be adopted.

Motion seconded.

Mr. Remington then took the floor and said he thought the Association should not lose the opportunity of thanking Mr. Hancock for his work in this matter, as he had been the prime mover of the business of erecting a statue to Prof. Procter, and he therefore moved that the thanks of the Association be given to Mr. Hancock and he be empowered to proceed with this work, which is not yet finished;

and further, Mr. Remington stated that he personally felt exceedingly thankful that the Association had a man like John Hancock who had pushed the matter to completion after so many years of hard work.

(Applause.)

The President then asked Mr. Wallace if this could be submitted as an addition to his motion. Mr. Wallace said he was willing to accept any addition that Prof. Remington had to offer.

Mr. Lemberger, in seconding the motion, said that he had been familiar with the project for some years and he knew personally how industriously and assiduously and persistently his friend Mr. Hancock had worked on this scheme, and that he deserved the thanks of the American Pharmaceutical Association.

Motion with Prof. Remington's addition unanimously carried.

Mr. Mayo then moved that the American Pharmaceutical Association petition Congress to set aside a site and to supply a suitable base for the erection of this monument and that the matter be placed in the hands of the committee on the William Procter Memorial Fund.

President Beringer suggested that the motion should also provide for the Government taking care of the monument after it is dedicated. Mr. Mayo accepted the suggestion. Motion seconded by Mr. England and carried.

There being no further business before the Association at this time, on motion of Mr. Wallace, duly seconded, the Convention stood adjourned subject to the call of the Chair.

THIRD GENERAL SESSION.

President Beringer called the third general session to order Friday evening, August 28th, at 7:15 p. m., in the convention hall of the Hotel Pontchartrain, on the twelfth floor.

The Secretary read the minutes of the second general session held Tuesday morning, August 25th. On motion of Mr. Wallace, duly seconded and carried, the minutes were ordered approved as read.

Secretary England of the Council read the minutes of the session of that body. Printed at page 1388.

On motion of Mr. Mason, duly seconded and carried, the minutes of the Council were approved as read.

The President announced that the next order of business was the consideration of the report of the Committee on Time and Place of Meeting, and said that the status of the situation was that on Tuesday morning at the second meeting of the general session it had been moved, seconded and carried that the determination of the time and place of meeting be decided at a special meeting of the general session to be called by the Chair, which meeting was now called; that since that time the Committee on Time and Place of Meeting had prepared a supplemental report which they desired also to submit, and if there was no objection from any of the members present, the Secretary would read the supplemental report so that the members could have full information before them in considering the question.

The Secretary thereupon read the supplemental report of the Committee, recommending that the meeting of the Association be held in San Francisco in 1915.

President Beringer then asked the Secretary to read an invitation received that day from the Springfield, Mass., Board of Trade.

President Beringer then stated that the report of the Committee was before them for action, and asked for the pleasure of the convention.

Mr. Wm. C. Anderson, of Brooklyn, N. Y., moved that the supplemental report of the Committee on Time and Place of Meeting be adopted. Motion seconded by Lewis C. Hopp, of Cleveland.

Mr. Samuel L. Hilton, of Washington, D. C., moved to amend the motion and make the place of meeting Asbury Park. Motion seconded by Mr. C. P. Wimmer, of New York.

Mr. Remington then offered a substitute for the motion and the amendment and named San Francisco as the next place of meeting. Motion seconded by Mr. Weinstein.

Mr. Remington stated that in a way the Association was committed to go to San Francisco; that there had been no vote taken, and he believed there was nothing official on the subject, but like a great many other things, when the Association goes to certain place at a certain time, it has been a well established practice for the parties who want us to go to a certain place to begin their efforts in that direction two or three years beforehand and name the place as a possibility, of course; that there was nothing binding on the Association to go to San Francisco except that the proposition was favorably received at the time it was made although no vote had been taken.

Further, Mr. Remington said that last year the International Pharmaceutical Congress at its meeting at The Hague, was invited to come to San Francisco, and they were coming and would have been there, but the prospects at this time were not favorable for their coming; and it was impossible to tell what was going to happen during the coming year. In view of the fact that nobody could tell what was going to happen, he, for one, preferred, unless the Association cared to go to San Francisco, leaving the matter of time and place for Council to settle, when we know what is going to happen in this country and what is going to happen in foreign countries.

Mr. Remington in concluding said he wanted to record his preference at this time to go to San Francisco and carry out what was partially promised at previous meetings, and he therefore made the motion to go to San Francisco.

Mr. Schneider, as a member of the Committee and as a native son of California, spoke in favor of San Francisco, and said that Mr. Hatfield, field worker of the Exposition, and engaged in securing conventions, had met with the Committee yesterday and they had had quite a long talk with him. He further stated that quite a number of the members had asked him whether the Exposition was going to come off on schedule time, and in reply to that said there would be absolutely no hitch whatsoever; that the Exposition will open on the 14th of February and will remain open until the December following, which gives a long period of time during which visitors can come and stay as long as they wish. Mr. Schneider mentioned this in connection with the statement that was made, that during the time of the Exposition nobody could get accommodations, which was perhaps true in a measure of the World's Fair at Chicago, where the time that the Exposition was open was much shorter. Mr. Schneider said that the long period of time during

which the San Francisco Exposition will be open would give everybody an opportunity to come at a time when there is no congestion. He would make this promise, that if anyone who came to San Francisco, should the Association decide to meet there, had any trouble in getting accommodations, he would see to it that they got accommodations anywhere in the city where they wished to stay, either for the Convention, or later. The Exposition was coming off on schedule time as far as they now knew and that the only difference the war in Europe would make would be in the exhibits, possibly, of the three nations who are involved in the war, out of the thirty-six nations who have expressed their readiness and intention to participate in the Exposition, the three nations being France, Russia and Italy, Germany never having signified their intention of making a national exhibit, although, of course, some German manufacturers agreed to exhibit, and whether these exhibits would be discontinued or not Mr. Schneider could not say. The only effect of the war, would be to reduce the number of visitors from Europe, which, however, would not amount to much anyway; not more than five thousand visitors at the most would have visited San Francisco from Europe in case there had been no war. This would be offset by an increase in the number of visitors from the Western Hemisphere; and the exhibits, as far as the Western Hemisphere is concerned, will be increased as an offset against the decrease in the exhibits from the European countries.

Mr. Schneider said that the hotels in San Francisco had agreed not to raise their prices and that the members could make provision for hotel accommodations right now, and get good rates. The hotel rates in San Francisco are very reasonable, and were very much lower than they were in Detroit, and lower than they were in Los Angeles; that perhaps the members who attended the convention at Los Angeles would remember the rates charged at the Hotel Alexandria. Mr. Schneider assured the members that there were no such rates in San Francisco, and that they could get good hotel accommodations, good rooms, from a dollar up, mentioning the Hotel Fairmount, the largest hotel in San Francisco, many times larger than the Pontchartrain, where good rooms could be obtained for \$2.50.

In closing, Mr. Schneider said that he did not know of much more that needed to be said. He was satisfied the Exposition was coming off and no one need hesitate on that account. The California climate was ideal, and San Francisco was an ideal convention city. Every city made such claims, but San Francisco he felt sure, received more conventions than any other city in the United States. It was constantly decorated, and the first thing one would say in going up Market Street would be, "What is going on?" There would be one convention there one week and something else there the next week; constantly decorating and re-decorating, and he certainly hoped the Association would decide to come to San Francisco.

Mr. Wilbert said that we are living in troublous times; we don't know what tomorrow will bring forth, and that we should be cautious. He thought the number of members present was insufficient to be representative; that those who were "young" enough to remember fifty-five years back when the Association agreed to meet in St. Louis had no idea that St. Louis would be in the war zone the following year. We who are living today cannot say what the Pacific coast will encounter two weeks from now, three months from now, or six months from now, and he thought it would be unfair for the Association to take snap judgment at this

time with the limited number of members present, and for that reason moved as a substitute for all the motions that this matter of time and place of meeting be referred to the Council to be decided not earlier than January, 1915.

In concluding, Mr. Wilbert stated he thought this was an important matter, and it would be unfortunate for the Association to drop a meeting.

Motion seconded by Mr. Apple.

Mr. Albert M. Roehrig, of Buffalo, N. Y., did not understand how the Council would be more representative than the meeting the Association was holding, and it seemed to him a very fair expression of what the members desired could be obtained at the meeting and avoid the necessity of waiting until the Council decided the matter three, four, five or six months hence; that if the people want to go anywhere they desire to begin to make their plans now and to know how far they are going.

Mrs. Fletcher Howard, of Los Angeles, Cal., as President of the Ladies Auxiliary of the Pharmaceutical Association of the State of California, extended the greetings of the California Associations and said those who attended the meeting at Los Angeles a few years ago would know that California delivered the goods it promised in the way of entertainment. Mrs. Howard said that they were now decorating all over the state in preparation for the Exposition, and that even the street lamps in Los Angeles were decorated with golden poppies, and the buildings were decorated with ornamental plants; that the efforts being made were truly remarkable and that the members could have no conception of what is being done in the State of California to entertain the expected visitors; that as you come into the state at San Diego, San Francisco, or Los Angeles, you will find that California is waiting to welcome you with outstretched arms, and in addition to the natural beauties of California, you will receive an educational impulse and impetus from the wonderful exhibits at the Exposition which you cannot afford to forego; that the members should remember this, that if they decided to go to some other place, many of them could not afford to attend the Convention and the Exposition too.

In concluding, Mrs. Howard stated that in going to San Francisco the members would have the opportunity of attending two of the greatest expositions in America in addition to the beauties which they would see during the whole long trip to California, and also up and down the State of California, and that she knew they would come to California. (Applause.)

Mr. Jeannot Hostmann, of Hoboken, N. J., stated that as a loyal citizen and native son of the State of New Jersey, he thought he would indeed be derelict if he did not say something in favor of New Jersey; that as far as Asbury Park is concerned, from a convention standpoint, he did not think it was necessary to say that they can properly take care of any convention that should see fit to choose that place; furthermore, that as the President of the New Jersey State Association had seen fit to write the letter of invitation, that the members of the State Association would leave nothing undone to make it as pleasant as possible for the Association. As an additional reason why the Association should come to New Jersey, Mr. Hostmann said that most of the conventions in recent years had been held in the middle west or the far west; that if the convention came to the New Jersey coast the members would not find as many diversions to take them away

from the meetings as they would if they went to San Francisco when the Big Fair is on, something which happens once only in great while, and he feared that many of the members, if they went there to attend the convention, would be found at places other than at the section sessions.

Mr. Gordon said that he had originally moved that the next session be held at Atlantic City, but since talking the matter over with others, he had come to the conclusion that Mr. Wilbert had reached, that under the present circumstances, the war in Europe, he thought the wisest thing for the Association to do would be to leave the matter of place of meeting to the Council. It was not essential that the place of meeting be decided upon that night, that week or three months hence, as there would still be ample time for everybody to get ready and the Council could take into consideration many things which could not be taken into consideration in general debate, and for that reason he was heartily in favor of Mr. Wilbert's motion.

Mr. Holzhauer said so far as New Jersey was concerned, it was immaterial whether they met at Atlantic City or Asbury Park, but if they decided to go to either place, that the New Jersey Association would do their very best to please everybody.

Mr. Whelpley then took the floor to speak on Mr. Wilbert's motion and stated that he fully realized the force of his statement as to the uncertainty of the very near future, but personally did not agree with the conclusion that it was best to leave the entire matter to Council and leave the question of place of meeting undecided for an indefinite time; that the Council did not desire to shirk responsibility or duty, but the Council would feel that the number of people present there that evening were more able to express their preference than Council would be; that if a decision was reached as to the time and place of the 1915 meeting and some of the forebodings that had been mentioned came true so that it was not possible or desirable to carry out the vote of the Association, the Council could, and would be expected, by reason of the authority vested in it by the Constitution and By-laws, to act in accordance with the circumstances. He urged that a vote be taken then and leave to the Council's care the future.

Mr. F. J. Wulling, of Minneapolis, stated that the meeting of the American Chemical Association which was scheduled to meet in Montreal, had been called off by the governing body of the Association because Montreal is located in a country which is now a belligerent state, and should the occasion arise, the Council of the American Pharmaceutical Association would have the power to either change the time and place of meeting, or cancel it entirely, a contingency which was to be hoped, of course, would not happen at all.

Mr. Wilbert's motion was lost.

Professor Remington's substitute motion naming San Francisco was then voted upon and carried by a vote of 53 to 34.

Mr. Wilbert then moved that the Association vote to meet in San Francisco in 1915; motion seconded.

Mr. Lemberger then moved that the Association make it unanimous for San Francisco; motion seconded by Mr. Anderson and carried.

Mr. Wulling then moved that the date of the meeting be referred to Council for decision; motion seconded and carried.

The Chair then stated that there had been quite a number of propositions looking to the reform of procedure in the Association, and that at a meeting of the Council a committee had been appointed to prepare necessary amendments to the by-laws to carry out the decisions of the Council and asked if the Committee were ready to report.

Mr. Mason then read the report of the Committee on By-Laws.

(Printed in last issue.)

Mr. Wilbert then moved that the report of the Committee be received; that the rules as read be adopted and that the portion of the report relating to changes in the by-laws be laid over until the next meeting of the general session; motion seconded.

Mr. Remington stated that a committee had been appointed on the President's address, which had contained quite a number of recommendations, and that committee had been hard at work on the address, only to find that the Council had already taken up those things and voted on them; that the secretary's report had been turned over to the same "distinguished, hard working and suffering" committee; that now that the work had been completed, Mr. Mason had gotten up and that the work of his committee had been wiped out, and asked what was going to be done for the Committee on President's address.

The Chair stated that the report of the Committee on President's address would be received, and that the report of Mr. Mason's committee would be allowed to go through as presented.

Mr. Remington then moved that Mr. Mason's report be laid on the table until his committee could submit their report.

Mr. Mason replied as a matter of information he would like to state that that portion of the President's address which referred to the subject matter of his report was specifically not given to Prof. Remington's committee; that he himself, on Monday afternoon, had made the motion that that portion of the President's address referring to internal reforms be not referred to the Committee on President's address but set apart to the Council.

Mr. Remington replied that the Committee on President's Address had received no such instructions; that they had been given the address and had gone ahead like "honest, long suffering citizens" and had worked on it and were prepared to make their report, asking what disposition was to be made of it.

The President then stated the motion of Mr. Wilbert, that that portion of the report relating to amendments of by-laws be laid over until the next meeting of the general session, and that that portion of the report relating to rules for the guidance of future program committees be adopted.

Mr. J. M. Riber then moved that the report of the Committee on President's address be heard and that then the Convention would know what to do with both reports; motion seconded; motion carried.

Mr. Remington then submitted the report of the Committee on President's address, as follows:

REPORT OF THE COMMITTEE ON PRESIDENT'S ADDRESS.

Your Committee, to whom is entrusted the work of reporting upon the President's address, beg to present the following report:

1. The endorsement of the objects of the International Pharmaceutical Federation be approved and it is recommended that the Council be authorized to make application for *active* membership of the A. Ph. A.

2. The recommendation of the President to reduce the number of members necessary for the organization of a local branch be reduced from twenty-five to fifteen, and that the Chairman of the Committee on Local Branches provide for Bulletin to be issued to the local branches suggesting topics of importance for discussion.

3. The recommendation of the President that a Special Committee should be created on *Pre-requisite Laws* to take such action as will encourage the Pharmacists of each State where such a law does not exist to have passed an amendment to the Pharmacy Law which will secure the passage of such a Pre-requisite Law to take such action as will encourage the Pharmacists of each State where such a law does not exist to have passed an amendment to the Pharmacy Law which will secure the passage of such a Pre-requisite law. It is suggested by your Committee that the election of this Special Committee be referred to the Council for action.

Disapproved.

4. The suggestion of the President that the Council shall take into careful consideration the subject of the preparation of a *Pharmaceutical Syllabus*, expressive of the views of the pharmaceutical educators is approved.

5. The Recommendation of the President that a *Special Committee*, consisting of the President, of the Association and the living former Presidents to report to the Association at its next meeting upon the subject of standardizing of Pharmaceutical degrees, be approved.

6. Your Committee regards favorably the proposition to create an *Advisory Board* consisting of the ex-Presidents of the Association to whom may be referred such subjects as the Council may direct for their report and decision.

7. The recommendation is approved that this Association joins with other organizations in urging a modification of the Postal regulations to permit the shipment of medicines by Parcel Post or through the mail, provided that such medicines are *not* of such a character as to damage the contents of the mail bag and do *not* belong to the class of habit-forming drugs.

8. We approve of the President's recommendation that a Committee be appointed to prepare and introduce a new bill at the next session of the Congress improving the status of Pharmacists in the Army Service of the United States.

9. Your Committee approves of the recommendation of the President that some plans should be formulated for the protection of the public and for the prevention of accidents due to swallowing bi-chloride tablets or their solutions. Your Committee is not united in the selection of the form and shape to be recommended, but believe that this should be settled after a discussion in an open meeting of the Association.

10. The recommendation of the President that a Year Book of the A. Ph. A. be completed and published within a reasonable time after the expiration of the year, which it represents, is approved by your Committee.

11. The Committee recommends that the suggestion of the President to continue the publication of the *Code of Ethics* in the Year Book be approved.

12. The Committee on Publication, in view of the Publication of the Journal and other duties, require some addition to their clerical force and the recommend-

ation of the President is approved that the appropriation for the use of the Committee be paid in quarterly sums in advance. It is further recommended that the Council takes steps to give the Committee on Publication more extended power.

13. The Committee approves of the publication of an Epitome on the N. F. with the objects stated in the address and that there be established a Committee on Propaganda with the object of increasing the use and extending the influence of the N. F. preparations.

14. Your Committee approves of the suggestion of the President, that Committees recommended by the various Sections should be approved by the Council before assuming their duties.

15. The recommendation of the President that a filling of vacancies in the Offices of Sections should be filled by the President when occurring *ad interim* is approved.

16. Your Committee heartily approves of the recommendation of the President that more time should be given by the Nominating Committee when selecting candidates for the offices of the Association. There is no question that this is a reform greatly needed.

17. We approve of the recommendation of the President that local Branches of the A. Ph. A. should *nominate* a member for the Council and that the Council itself elects or declines as in its judgment seems best.

18. The recommendation of the President that the functions of the House of Delegates be restricted to the consideration of topics of general interest, is approved, but the Committee believes that a Special Committee should be appointed to take into consideration the whole subject of the function of the House of Delegates.

19. The recommendation that the Association should have its own Committee on Resolutions and that this Committee should hold open sessions for their discussion, is approved.

20. Your Committee approves the recommendation of the President to provide for Auxiliary of Women members who shall be eligible.

21. The plan recommended by the President for consolidating some of the Sections in his address with a view of facilitating the business of the convention is also approved.

Respectfully submitted,

R. H. WALKER,
JOS. L. LEMBERGER,
OTTO RAUBENHEIMER,
JOSEPH P. REMINGTON, Chairman.

Mr. Whelpley then moved that the report of the Committee on the President's Address and the further consideration of the special committee be laid over until the next general session; that in addition, he would like to call the attention of those present to the fact that this was an adjourned meeting of the general session and was occupying the time that was provided for in the general program for a joint session of the Boards of Pharmacy, Conference of Faculties and the Section of Education and Legislation; that this meeting had been called for a specific purpose, and that the other matters that had been brought up were incidental to the main issue.

The above motion being duly seconded, was carried.

Mr. Hugh Craig, of Chicago, stated that there was in the hands of the General

Secretary a communication from the Section on Education and Legislation which he thought should be brought up at this general session.

The Secretary then read the following communication :

The Section on Education and Legislation recommends the adoption of the following preamble and resolution :—

WHEREAS, National Anti-Narcotic Legislation regulating the traffic in Narcotics is absolutely necessary for the effective control of the Narcotic evil, and

WHEREAS, State laws regulating this traffic cannot be effectively enforced, without Federal Legislation that will provide a record of purchases of narcotics in inter-state commerce, and

WHEREAS, The personal attendance clause and the record keeping clause of H. R. Bill No. 6282 are not absolutely essential for the purpose for which the Bill is intended, therefore be it,

Resolved, That the American Pharmaceutical Association, in Convention assembled urges the passage of H. R. Bill, 6282, as it passed the Senate of the United States.

HUGH CRAIG, Chairman,

W. S. RICHARDSON, Acting Secretary.

Upon motion of Mr. Anderson, seconded by Mr. Nitardy, the communication was received and the recommendation adopted.

There being no further business to come before the session at this time, Mr. Whelpley moved an adjournment, which was duly seconded and carried.

W. S. RICHARDSON,
Chairman House of Delegates.

E. FULLERTON COOK, P. D.,
Ex-Chairman Section on Pharmacopœias and
Formularies.

PROCEEDINGS OF THE COUNCIL—(THIRD SESSION FOR 1913-1914).

The third session* of the Council of the American Pharmaceutical Association for 1913-14, was held at the Hotel Pontchartrain, Detroit, on Monday, August 24, 1914, at 9:30 a. m.

Chairman E. G. Eberle presided.

Present: Messrs. Alpers, Apple, Asher, Beringer, C. E. Caspari, Eberle, England, Godding, Havenhill, Hopp, Lyons, Koch, LaPierre, Mason, Mayo, Nitardy, Richardson, Ruddiman, Sayre, Schneider, Seltzer, Stewart, Thomas and Whelpley.

The reading of the minutes of the previous meetings of the Council and of the Council Letters was on motion, dispensed with, except Council Letters Nos. 30 and 31, which were read and approved.

The voting cards on Motion No. 48 of Council Letter No. 31 (on special order of business for Council meeting of August 25, 1914) had been sent out by the Secretary but the replies had not been received. Motion No. 48 was then taken up for reconsideration and H. B. Mason moved, seconded by G. M. Beringer, that the motion be adopted. Carried.

President Beringer discussed the subject of delegate-representation at the first general session of the Association to-day and urged that the usual courtesies be extended to the delegates at the sessions, which was agreed to.

The report of the Secretary of the Council was read, as follows:

To the Members of the Council:

Gentlemen—The Council held two sessions at the Nashville (1913) meeting and has transacted business by mail since.

Thirty-one Council Letters have been issued, covering 91 pages, and 48 motions.

The members elected number to date 404; the number last year by the first session of the Council was 299.

A synopsis of the motions of the Council is submitted and will become a part of the records. The minutes up to July 29, 1914, (Council Letter No. 29) have been published in the JOURNAL.

The membership of the Council now numbers forty, of which sixteen are Local Branch representatives.

The three members of the Council elected by mail on November last for 1914-15 were: Otto F. Claus, St. Louis; M. I. Wilbert, Washington, and William B. Day, Chicago.

Respectfully submitted,

J. W. ENGLAND, Secretary of the Council.

SYNOPSIS OF MOTIONS OF COUNCIL, 1913-14.

Motion No. 1—That the Sixty-second Annual Meeting of the American Pharmaceutical Association be held during the week beginning Monday, August 17, 1914. Carried.

Motion No. 2—That the date "August 24, 1914" be substituted in Motion No. 1 (C. L. No. 1) for the date of "August 17, 1914." The substituted motion will then read: "That the Sixty-second annual meeting of the American Pharmaceutical Association be held during the week beginning Monday, August 24, 1914." Carried.

* The first and second sessions of the Council for 1913-14 were held at Nashville, Tenn., August 22 and August 23, 1913.

Motion No. 3—That the sum of Thirty-five Dollars (\$35.00) or so much thereof as may be necessary, be appropriated for Badges and Bars.

Appropriation approved by the Committee on Finance. Carried.

Motion No. 4—Election of Members Nos. 1-8, inclusive. Carried.

Motion No. 5—That Wilhelm Bodemann be elected as the representative to the Committee on Transportation from Chicago. Carried.

Motion No. 6—That E. Floyd Allen be elected the representative to the Committee on Transportation from St. Paul or Minneapolis. Carried.

Motion No. 7—That Fred I. Lackenbach, of San Francisco, be elected a member of the Committee on Transportation to represent San Francisco. Carried.

Motion No. 8—That John G. Roberts, of Philadelphia, be elected a member of the Committee on Unofficial Standards, succeeding Francis Hemm. Carried.

Motion No. 9—That the bond of the Treasurer be renewed with the Fidelity and Deposit Company of Maryland. Carried.

Motion No. 10—That \$250 be appropriated for the use of the Committee on Membership. Appropriation approved by the Committee on Finance. Carried.

Motion No. 11—That \$25 be appropriated for the use of the Women's Section. Appropriation approved by the Committee on Finance. Carried.

Motion No. 12—That the annual salary of the Editor of the Journal be increased \$1,000, said increase to take effect as of September 1, 1913.

Motion No. 13—Election of Members Nos. 9-17, inclusive. Carried.

Motion No. 14—That the sum of Twenty-five Dollars be appropriated for the use of the National Drug Trade Conference. Appropriation approved by the Committee on Finance. Carried.

Motion No. 15—Election of Members Nos. 18-24, inclusive. Carried.

Motion No. 16—The Committee on Finance submits for approval the following:

Proposed Budget of Appropriations for 1914.

Item.

1—Salaries	\$6500

23—Section on Pharmacopœias and Formularies.....	25
24—Women's Section.....	25
25—National Syllabus Committee.....	25

\$19,510

Motion No. 17—That the sum of \$250 or as much as may be necessary, be appropriated for badges and pins in accordance with the resolution of the Nashville (1913) meeting, that badges and pins be supplied to dues-paid members of the Association at the price of twenty-five cents each, which shall include cost of postage, and that the Secretary of the Council be authorized to order one thousand badges and pins, assorted, of best quality, design No. 3, as per bid submitted by the Whitehead & Hoag Co. Appropriation approved by the Committee on Finance. Carried.

Motion No. 18—That the Tentative Program for 62d Annual Meeting, as submitted, be approved. Substituted by Motion No. 19.

Motion No. 19—That the "Tentative Program for the 62nd Annual Meeting" be published and criticism and comments be invited before final adoption." Carried.

Motion No. 20—Election of Members Nos. 25-33, inclusive. Carried.

Motion No. 21—That the Report of the Committee on Publication with its recommendations and authority to employ E. C. Marshall as Advertising Manager be approved. Carried.

Motion No. 22—That the sum of one hundred dollars (\$100.00), or so much thereof as may be necessary, be appropriated for the use of the Committee on Status of Pharmacists in the Government Service. Appropriation approved by the Committee on Finance. Carried.

Motion No. 23—That the sum of two hundred and fifty dollars (\$250.00) or so much thereof as may be necessary, be appropriated for payment of the expenses of delegates to the National Drug Trade Conference during the year 1914. Appropriation approved by the Committee on Finance.

Motion No. 24—Election of Members Nos. 34-54, inclusive. Carried.

Motion No. 25—(1) That the American Pharmaceutical Association accept the complete assignment of the patent-rights of the Norwich Pharmacal Co. in and to a design patent for a Poison Tablet, Serial Number 801,748, as tendered by the said Norwich Pharmacal Company in their communication to the President of the Association, dated February 16, 1914, and presented in Council Letter No. 12.

(2) That the American Pharmaceutical Association hold such design patent exclusively for the free use of the medical and pharmaceutical professions of the United States, without restrictions except such as may be necessary to prevent possible abuse through use of the design for confectionery or other non-poisonous substances.

(3) That the American Pharmaceutical Association hereby tenders to the Norwich Pharmacal Company a vote of thanks for their generous and public spirited proposition. Carried.

Motion No. 26—Election of Members Nos. 55-90, inclusive. Carried.

Motion No. 27—Election of Members Nos. 91-123, inclusive. Carried.

Motion No. 28—That the resignation of James H. Beal as Editor and General Secretary to take effect May 1, 1914, or after the issue of the Journal for that month, be accepted. Substituted by Motion No. 30.

Motion No. 29—That Ernest C. Marshall, at present Advertising Manager of the Journal, be elected as Acting Editor of the Journal and Acting General Secretary of the Association until the annual meeting of the Association at Detroit during the week of August 24 next, the Association to pay him for all of his duties at the rate of three thousand dollars per year from the time when he takes full charge to the first of September. Substituted by Motion No. 31.

Motion No. 30—(Substitute for Motion No. 28.) That the resignation of Dr. James H. Beal as Editor and Secretary be accepted with the sincere regret of the Council and with the understanding that such resignation shall not take effect until September 1, 1914. Carried.

Motion No. 31—(Substitute for Motion No. 29.) That Dr. James H. Beal be relieved of the active work of the Secretaryship and Editorship of the JOURNAL as far as possible, and that he be authorized to make the best arrangements he can with Ernest C. Marshall or other person or persons that he may select, to carry on the work of the offices of Secretary and Editor under his direction until September 1, 1914. Carried.

Motion No. 32—That the organization of the San Francisco Branch of the American Pharmaceutical Association be approved. Carried.

Motion No. 33—That the appointment of Harry B. Mason as Chairman of the Committee on Commercial Interests be approved. Carried.

Motion No. 34—Election of Members Nos. 124-160, inclusive. Carried.

Motion No. 35—That the Program for the Sixty-second Annual Meeting as submitted be approved.

Motion No. 36—(Amendment of Program for Sixty-second Annual Meeting.) That the second session of the Commercial Section be held on Wednesday, August 26, at 9:30 a. m., instead of Friday, August 28, at 9:30 a. m., and (2) that the second session of the Conference of Pharmaceutical Faculties be held on Wednesday, August 26, at 10 a. m., and (3) that the original program as amended be substituted for the program given under Motion No. 35.

Motion No. 37—Election of Members Nos. 161-196, inclusive. Carried.

Motion No. 38—(Substitute motion for Motions Nos. 35 and 36 in re. Program for Sixty-second Annual Meeting.) Carried.

Motion No. 39—That the organization of the Columbus Branch of the American Pharmaceutical Association be approved. Carried.

Motion No. 40—That an appropriation of \$50 or less be made to the Section on Pharmacopœias and Formularies. Appropriation approved by the Committee on Finance. Carried.

Motion No. 41—(1) That the American Pharmaceutical Association accept the complete assignment of the patent rights of the William S. Merrell Chemical Co., in and to a design patent for a new, original and useful improvement in packages for Antiseptic Poisons, serial number 817,384, as tendered by the William S. Merrell Chemical Co. in their communication to Professor Julius A. Koch, dated May 15, 1914, and presented in Council Letter No. 21.

(2) That the American Pharmaceutical Association hold such design patent

exclusively for the free use of the medical and pharmaceutical professions of the United States, without restrictions, except such as may be necessary to prevent possible abuse through use of the design for non-poisonous substances.

(3) That the American Pharmaceutical Association hereby tenders to the William S. Merrell Chemical Co. a vote of thanks for their generous and public-spirited offer.

Motion No. 42—(Amended Motion of Motion No. 41 (par. 1), for Assignment of Patent Rights for Improved Package for Antiseptic Poisons) as follows: "Resolved, That the American Pharmaceutical Association accept the completed assignment of the patent rights of the William S. Merrell Chemical Co. in and to a design patent for a new, original and useful improvement in packages for Antiseptic Poisons, serial number 817,384, provided such patent and assignment is completed without expense to the Association or associated with any other conditions than that named in the assignment."

Motion No. 43—That the name of the subdivision of the American Pharmaceutical Association now known as the Women's Section be changed to the Women's Auxiliary, and that all matters of constitution and by laws of this Auxiliary be left to the determination of those who shall constitute it, with the provision that membership in the Auxiliary be limited to the women members of the immediate family of all members of the Association." Substituted by Motion No. 45.

Motion No. 44—Election of Members Nos. 197-281, inclusive. Carried.

Motion No. 45—That the consideration of Motion No. 43 be postponed until the annual meeting of the Association in Detroit. Carried.

Motion No. 46—That the Committee on National Formulary be authorized to call a meeting of the committee for the purpose of a personal conference during the two days succeeding the last session of the Association at Detroit, the matter of appropriation for expenses incurred by the Committeemen for transportation, sleeper, hotel expenses, etc., to be passed upon by the Council at the Detroit meeting. Carried.

Motion No. 47—Election of Members Nos. 282-345, inclusive. Carried.

Motion No. 48—That the whole subject of A. Ph. A. Reform (as contained in letter of H. B. Mason in Council Letter No. 31), be made a special order of business at the meeting of the Council on Tuesday evening, August 25, 1914.

The Report of the Secretary of the Council was received.

Applications for membership from Nos. 346 to 393, inclusive, were received, and the applicants elected. [For names see Council Letter No. 1, printed elsewhere.]

The Report of the Committee on Publication was presented as follows:

To the Members of the Council:

Gentlemen: At the Nashville (1913) meeting, the Association authorized the employment of an Advertising Solicitor and Assistant Editor of the Journal, at a salary to be fixed by the Committee on Publication, subject to the approval of the Committee on Finance and the Council.

Acting under this authority, the Committee on Publication elected Mr. Ernest C. Marshall at an annual salary of fifteen hundred (1500) dollars plus 20 per cent for commissions on the advertisements he secured up to a maximum of one thousand dollars and 10 percent on all advertisements secured through outside

solicitors working under his direction, to pay the latter. In this way, the Advertising Manager cannot receive more than \$2500 a year, and the Association can receive about \$6500 or more in advertisements.

This action was approved by the Committee on Finance and the Council, as was also, the recommendation that the cumbersome title of "Advertising Solicitor and Assistant to the Editor of the Journal" be changed to "Advertising Manager."

Mr. Marshall began service on February 1, 1914, for one year, residing in Columbus, Ohio.

The Association has sustained a serious loss through the resignation by illness of Dr. James H. Beal as Editor of the Journal and General Secretary of the Association, who tendered his resignation to take effect on May 1, 1914. Dr. Beal wished immediate action, but was prevailed upon to postpone the date of resignation until September 1, 1914, and the arrangements were made with Mr. Marshall, Advertising Manager, to act as an Acting Editor and Acting General Secretary at a salary of \$250 per month, for June, July and August in lieu of all other compensation as Advertising Manager, etc.

We deeply deplore the necessity that has compelled Dr. Beal to resign, and we earnestly hope that, relieved from routine work and responsibility, he will soon recover his health and vigor, and we know that we voice the sentiment of the entire membership of the Association when we express to Dr. Beal our sincere gratitude for the splendid services and personal sacrifices he has made in behalf of the Association.

Regarding the selection of a new Editor and General Secretary, Dr. Beal writes that:—

"Unless some acceptable Editor and General Secretary should present himself before the Detroit meeting, I suggest that, instead of making a final selection at that time, the matter be left with the Publication Committee with power to act. This will give the Committee not only a chance to discuss the subject at the meeting, but will enable it to take its time in making final choice." We recommend that the suggestion of Dr. Beal be adopted.

The Journal—The number of reading pages of the Journal in 1913 was 1600, and in 1912 was 1466, an increase of 134 pages. In character and comprehensiveness of subject matter, as well as financially, and in stimulating the work of the Association, the Journal continues to more than justify its existence.

Expenditures for the Journal—The expenditures for the Journal for 1913 were \$5465.83, plus the Editor's salary of \$2133.13, or a total of \$7598.96, being an increase over 1912 in Journal cost of \$962.68, and in editorial cost of \$333.13, or a total of \$1295.81.

Receipts for Journal—The receipts of the Journal from advertisements, etc., for 1913 were \$3395.80, a decrease of \$259.62 over 1912.

Net Cost of Journal—The net cost of the Journal for 1913 was \$4203.16 and for 1912, was \$2647.72, an increase of \$1555.44.

Expenditures for the Year Book—The Year Book for 1912 (Volume 1), corresponding to Volume 60 of the former Proceedings of the Association, was issued in June, 1914, and cost \$1718.99 for the printing and \$244.99 for the mailing, or a total of \$1963.98, which, including the salary (\$1200) of the Reporter on the Progress of Pharmacy, amounted to \$3163.98.

The cost of the 1911 Proceedings (Volume 59) including the salary (\$1200) of the Reporter on the Progress of Pharmacy was \$4262.54, indicating a decrease in cost of \$1098.56. The number of pages of reading matter in the two books was nearly the same—620 in the 1912 Year Book and 670 in the 1911 Proceedings.

The Committee feels that especial praise is due to Professor Diehl for his able work as Reporter on the Progress of Pharmacy. We know of no other work of reference, which, in its field, compares with our Year Book, because the work is a real digest of pharmaceutical literature and not a mere description index, as are so many similar publications. Year Books prepared along the lines laid down

by Professor Diehl, are of the greatest service for reference by pharmacists, and amply justify the wisdom of the Association in deciding to issue separate volumes, rather than including the subject matter of the same in the pages of the Journal.

Expenditures for all Publications—The total net cost of the publications for 1913 was \$7367.14 and for 1912 were \$6910.26, an increase of \$456.88. The estimated cost of the Boston (1911) meeting was \$6500 and the expenditures of the Proceedings for 1908, 1909 and 1910, averaged \$7000 for each year.

The total net cost of the publications for 1914 will be distinctly more than in 1913, because of the salary of Advertising Manager Marshall (\$1500) and because there has been no increase in the Advertising receipts, at least to date. This is not the fault of the Advertising Manager as he has had only four months service in such work alone. The rest of his time has been devoted to his newer duties of Acting Editor and Acting General Secretary.

In connection with the subject of the Year Book of 1913, Professor Diehl writes, August 1st: "The work of the Year Book is now so far advanced that I can send the list of most of the cuts required to the General Secretary in the course of the next eight or ten days, and I am confident that the abstracts will be completed and the matter arranged for the printing or shortly after the meeting in Detroit.

It is earnestly hoped that it will be possible to issue the 1913 Year Book immediately after the Detroit meeting, or at the earliest possible moment, even if it becomes necessary to borrow money to finance the National Formulary.

Treasurer Whelpley speaks very earnestly about the necessity of issuing our Year Book more nearly in conformity with the date. He writes:

"The A. Ph. A. members promptly paid their 1913 dues early in the calendar year. They have not yet received the Year Book for 1913. Such a condition does not place them in a very favorable frame of mind when the Treasurer asks for the 1914 dues."

National Formulary (IV)—The Committee on Publication has invited bids for the composition, electrotyping, printing and binding, etc., of the National Formulary (IV) from the same firms that were invited to bid for the U. S. Pharmacopœia, and the bids received will be opened by the Committee and reported upon to the Council later.

It will be recalled that at the Denver (1912) meeting of the Association, a communication was received from the Lloyd Library offering to take charge of all publications of the American Pharmaceutical Association under certain conditions. The offer was referred to the Committee on Publication and after consultation the original offer has been modified by Professor John Uri Lloyd as follows:—

"In reply to your letter of July 14th I will state that I first regret that the American Pharmaceutical Association could not see its way to accepting the proposition made in 1912 by the Lloyd Library, whereby the Society's publications would be systematically arranged and the Association relieved from detailed journalistic correspondence and the yearly distribution of its Proceedings.

Your suggestion that the Lloyd Library store your material, meets the approval of my brother and myself, but our Library is not at this time in a position to attend to the yearly publication distributions, or to the details of current exchanges. We can, also, arrange the yearly Proceedings consecutively, so as to enable you to fill orders as they come to you. These we can mail or express for you, on receipt of directions. The surplus stock of the Proceedings is, as you say, of no commercial value, but can occasionally be utilized in outfitting scientific libraries that are not in a position to make purchases, in which direction both the Lloyd Library and the Association would have passing opportunities. These volumes should, therefore be preserved, and as we have ample store room, we will systematically store them for you.

Therefore, if according to the foregoing, which seems to be the arrangement you

would like to have made, the publications of the Society be freighted, well boxed, to the Lloyd Library, Cincinnati, Ohio, they will be stored by the Lloyd Library and the reserve number of each year's proceedings systematically arranged in the manner herein suggested, thus being at the command of the Association. The journals, pamphlets, books and ephemeral publications we cannot undertake to sort out, but will store them, in bulk, if you desire, and hold them in store, subject to your order.

The publications will be at the command of the American Pharmaceutical Association, and will be transferred elsewhere, on their order. In case the Lloyd Library at a future date, cannot further store the documents, the society will remove them to some other location."

We recommend that the very generous offer of the Lloyd Library to care for the publications of the Association be accepted, with the thanks of the Association, that the General Secretary be authorized to make the necessary arrangements and to store the historical and other matters of the Association not taken care of by the Lloyd Library.

Very truly yours,

J. W. ENGLAND,

Chairman of Committee on Publication.

Mr. E. C. Marshall stated that the estimate of the cost of the Year Book for 1912 did not include the cost of expressage, which was about \$200.

This charge, it was explained by the Chairman of the Committee on Publication, was not contained in the figures furnished him by the Treasurer and the latter said that the information had been received by him subsequent to that of the data sent the Chairman. The express charges would increase the total net cost of the publications by about \$200.

The Chairman stated that the report was only a partial report and on motion the report was referred back to the committee to report upon in full later.

A communication was presented from E. Fullerton Cook, Chairman of the Section on Pharmacopœias and Formularies, upon the subject of the Section on Pharmacopœias and Formularies, and also, one from Miss Anna G. Bagley upon the subject of the Women's Section; the consideration of both was deferred until the meeting of the Council on Tuesday evening, August 25, 1914.

Chairman Eberle named the following committee on Credentials: F. W. Nitardy, Philip Asher and Dr. F. E. Stewart.

Dr. W. C. Alpers discussed the subject of adjourned Section meetings, stating that the privilege of holding adjourned meetings had been much abused. He moved, seconded by L. E. Sayre, that the Secretary of the Council be requested to notify the Chairman of the different sections of the Association that the sections must follow the program mapped out for them in the time allotted, and if they held adjourned meetings, they must adjourn to times that shall not conflict with the stated section meetings and general sessions. Motion carried.

Applications for membership from Nos. 394 to 404, inclusive were presented, as follows:

No. 394. J. A. Stewart, 720 Jefferson Avenue, E., Detroit, Mich., rec. by Leonard A. Seltzer and Wm. A. Hall.

No. 395. J. T. Delzell, Hersey, Mich., by Wm. A. Hall and Leonard A. Seltzer.

No. 396. Charles Sumner Koon, 35 W. Western Avenue, Muskegon, Mich., rec. by Leonard A. Seltzer and Wm. A. Hall.

No. 397. Albert G. Riestein, Detroit, Mich., rec. by Wm. A. Hall and Leonard A. Seltzer.

No. 398. Frank P. Lehr, 5400 Franklin Avenue, Cleveland, Ohio, rec. by Lewis C. Hopp and W. C. Alpers.

No. 399. Andrew Edward Walleck, 8341 Woodland Ave., Cleveland, Ohio, rec. by Lewis C. Hopp and W. C. Alpers.

No. 400. Morris E. Curtis, 3625 Detroit, Avenue, Cleveland, Ohio, rec. by Lewis C. Hopp and W. C. Alpers.

No. 401. Claude H. Parker, U. S. Marine Hospital, Boston, Mass., rec. by M. E. Berkowitz and Albert E. Roehrig.

No. 402. Wm. Daniel Hall, 35th and Queen Lane, Falls of Schuylkill, Pa., rec. by Robert P. Fischelis and H. V. Army.

No. 403. Theodore Charles Hageman, 1500 Chouteau Ave., St. Louis, Mo., rec. by G. A. Burkhart and J. W. Mackelden.

No. 404. John Durward Hyde, Sulphur Springs, Texas, rec. by R. H. Needham and H. M. Whelpley.

The applicants were elected.

On motion of H. M. Whelpley, seconded by J. W. England, an additional appropriation of \$50.00 for buttons and pins during the fiscal year of 1914 was made, the appropriation having been approved by the Committee on Finance.

Adjourned until Tuesday evening, August 25, 1914, at 7:30 p. m.

J. W. ENGLAND, Secretary.

(FOURTH SESSION OF THE COUNCIL FOR 1913-1914.)

The fourth session of the Council for 1913-14 was held on Tuesday evening, August 25, 1914, at 8 p. m., to consider the special order of business of Council Letter No. 31, under Motion No. 48.

Chairman Eberle presided.

President: Messrs. Apple, Asher, Beringer, Chas. E. Caspari, Clark, England, Fennel, Godding, Havenhill, Hopp, Koch, LaPierre, Mason, Nitardy, Payne, Richardson, Ruddiman, Sayre, Schneider, Seltzer, Stewart, Thomas, Whelpley and Wulling.

The recommendations of H. B. Mason contained in Council Letter No. 31 were taken up seriatim, as follows:

1. The customary addresses of welcome and responses thereto shall be omitted at the first general session and business will at once be started with the President's Address, exactly as is done in the Sections.

Decision: That addresses of welcome from local officials shall be omitted.

2. At the suggestion of the Local Committee the Council has already decided to hold its meetings in the evenings, with the exception of the opening session on Monday and Saturday mornings.

Decision: That as far as possible the meetings of the Council shall be held in the evenings, except the first and last sessions.

3. The Section work shall start promptly in the morning at 9:30.

Decision: Adopted.

4. The Section and Association meetings shall be confined to the morning and afternoon periods.

Decision: Adopted.

5. The principle of concurrent meetings of the sections has been extended more than ever before, and it should be arranged to co-ordinate the section work by a system of blackboards on which entries shall be made from minute to minute, showing precisely what is going on in the different sections at the same time.

Decision: Adopted.

6. Abolish the Section on Pharmacopœias and Formularies and let the work be done by the other sections.

A letter from E. Fullerton Cook, Chairman of the Section on Pharmacopœias and Formularies presented at the annual meeting of August 24, 1914, was read, as follows:

To the Members of the Council of the American Pharmaceutical Association:

Gentlemen:—The Section on Pharmacopœias and Formularies having been created by resolution, and not therefore enjoying the privilege of representation in the Council through its Chairman, has made it impossible for him, until recently, to have the opportunity of knowing of the discussion in the Council on the proposed reforms in business methods and organization; but his attention has just been called to the onslaught made by practically every would-be reformer upon the young and innocent Section on Pharmacopœias and Formularies. As Chairman of the Section it is permissible, perhaps, that a word of defense be added to the discussion.

The main argument advanced by all of those who would abolish the Section is that "its work can be done as well as by some other Section, such as Education and Legislation, Scientific or Practical Pharmacy." There has been apparently no attempt to discount the importance of the scientific work which the section may accomplish for the pharmacist, and there need therefore be no argument in defense of its possible activities, but the point which needs a reply is whether this field should be especially recognized and developed, or whether it would be blended with the hit-or-miss program of a general Section.

Recognizing the importance of the Pharmacopœia and various formulary books to the practicing pharmacist there seems ample justification for the assignment of a special section committee to this subject who will give it careful study throughout the year and develop a comprehensive program for the annual meeting. Without such definite assignment this important work is not likely to receive proper consideration by the chairman of other sections.

The proposal of Albert Schneider (see Council Letter No. 27, p. 76) that the sections be arranged in divisions, suggesting the several lines of work for each, partially covers this point, but in the plan proposed by Mr. Mason the value of this definite assignment of subject is entirely lost and one chairman is asked to develop a program covering four days of meetings, and along a variety of lines, in some of which he may have no interest or experience.

With the present plan of Sections a number of divisions covering specific lines of activity are provided and this need require no more time for meetings than in Mr. Mason's plan, which embraces simultaneous meetings of all Sections. If there are more divisions there will be at least two Chairmen developing programs for a smaller number of sessions each, instead of one Chairman often working in unfamiliar fields, trying to provide a program covering the entire time; also with the smaller divisions each Chairman will be selected for his familiarity with and interest in the specific subject of his section.

How illogical it is to expect a chemist to develop a program dealing with *materia medica* and pharmacognosy; yet this is exactly the condition Mr. Mason would ask you to provide. Many of Mr. Mason's proposals in Council Letter No. 31 (pp. 89-91) are excellent, but the abolishing of special sections should be very carefully considered before the vote is called.

Respectfully submitted,

E. FULLERTON COOK.

August 18, 1914.

Moved by F. M. Apple, seconded by F. E. Stewart, that the suggestion of President Beringer of a Section on Practice of Pharmacy with Committees on

Pharmacopœias, Formularies and Standards, on Commercial Interests, and on Practical Pharmacy and Dispensing be adopted, which motion was amended that the title of Commercial and Practical Pharmacy replace that of Commercial Interests and of Practical Pharmacy and Dispensing.

A substitute motion was then offered by H. B. Mason, seconded by L. A. Seltzer, as follows: That the Section on Practical Pharmacy and Dispensing be continued, but that there shall be within the latter a Committee on Pharmacopœias, Formularies and Standards to prepare a partial program for the section meetings. The substitute motion carried. The original motion and amendment were lost.

J. A. Koch rose to a question of privilege, stating that the hour for convening the meeting of the American Conference of Pharmaceutical Faculties had arrived, and moved that, by reason of this, the meeting of the Council be adjourned until Wednesday, August 26, at 9 a. m. The motion was lost.

It was moved by G. M. Beringer, seconded by F. J. Wulling, that the Section on Practical Pharmacy and Dispensing be renamed the "Section on Practice of Pharmacy," with two committees—(a) Operative Pharmacy and Dispensing, and (b) Pharmacopœias, Formularies and Standards. The motion was lost.

7. Discountenance the proposed Section on Materia Medica and Pharmacognosy as a separate section, but possibly favor it as a subdivision of the Scientific Section.

G. M. Beringer moved, seconded by F. H. Apple, that the work of the Scientific Section be divided into four committees (a) Chemistry, (b) Botany and Pharmacognosy, (c) Biologic Testing, (d) Bacteriology. The motion carried.

The opinion was expressed that the Committee on Program should be given authority to arrange all the details of the annual and section meetings.

8. Recognize the Report on the Progress of Pharmacy as being invaluable, but print it and give it no place at all in the program of the meeting. Adopted.

9. Adopt the general principle that the reports of standing and special committees should be presented to the Council as the board of directors of executive committee of the organization, and by the Council referred to the Association only when it deems such action necessary.

Moved by C. T. P. Fennel, seconded by L. A. Seltzer, that the reports of all standing committees must be in the hands of the General Secretary ten days prior to the date of the annual meeting.

On motion of G. F. Payne, seconded by F. M. Apple, it was urged, as a substitute motion, that the reports of all standing and special committees must be delivered to the General Secretary by the morning of the first general session.

The substitute motion carried and the original motion was lost.

On motion of G. M. Beringer, seconded by J. W. England, the power of appointing standing committees was directed to be more specifically defined in the by-laws—that is, whether they shall be appointed by the President of the Association, or by the Chairman of the Council.

The report of the retiring General Secretary and Editor of the Journal was read by request of J. H. Beal, to the Council.*

The recommendations contained therein were disposed of, as follows:

* This report having been presented to the general session also, it will be published only in the minutes of general session.—Secretary of the Council.

(1) That the portion of Article 1, Chapter VII of the By-Laws, which provides that any member of the Association may attend the meetings of the Council, be elevated to the dignity of a separate article, so as to emphasize the fact that the Council meetings are open to attendance by all the members of the Association; and also, that the requirement of a vote of the Council in order to permit non-members of the Council to speak, be changed so as to require only the consent of the presiding officer.

Decision: Adopted.

(2) That Section 3, Article 8 of Chapter VII be changed by striking out the requirement that the names of candidates for membership be read at the general session. Under our present practice there exists the anomaly that between annual meetings members are elected exclusively by vote of the Council, while if elected during the annual meeting, they must also be voted upon by the Association.

Decision: Adopted.

The by-laws require that applicants for membership elected by the Council shall receive a three-fourths vote of the members, and it was suggested that this be made a majority of the members, in view of the delay caused by the mail vote, but no action was taken.

(3) That the practice of reading the minutes of the Council at the General Sessions, which seems to be a matter of custom only and is not an express requirement of the by-laws, be done away with and the Council present to the general sessions only such matters as it deems of sufficient importance to require such reference.

Decision: That important matters of Council business shall be reported in full at the general sessions.

(4) Add a new by-law to Chapter VII, giving to any member of the Association, during any general session, the right to call for a report from the Council upon any matter which has received its consideration:

Decision: Adopted.

G. M. Beringer recommended that the custom of permitting each Local Branch to elect a representative of the Council be abolished.

On motion, the recommendation was not agreed to.

Recommendations Nos. 10 and 11 of H. B. Mason's letter (in Council Letter No. 31) were considered:

(10) The manuscripts of all section papers should be received at least four weeks before the annual meeting, and (11) all manuscripts shall then be sent by the Section officers to the General Secretary.

Decision: The chairman of the sections should use every endeavor to secure the manuscripts of all section papers within four weeks of the annual meeting and immediately send them to the General Secretary.

(12) The General Secretary should have accepted manuscripts printed in advance of the annual meeting, whenever, in the judgment of the chairmen of the sections, and the General Secretary, this is desirable.

Decision: Adopted.

(13) With all manuscripts in hand three or four weeks before the meeting, the General Secretary should prepare a collective program containing the detailed

programs of all the different sections, and indicating approximately when any given paper is coming up for attention.

Decision: Adopted.

(14) Have the Conference of Pharmaceutical Faculties meet either late the week before, or early the week following the A. Ph. A. itself, so as to avoid this element of confusion and scattered interest—either that, or else let these bodies use the evenings for their sessions.

Decision: Laid on the table.

Regarding the proposition to abolish the House of Delegates, the following motion was passed:

Moved by L. A. Seltzer, seconded by H. B. Mason, that a committee of three be appointed to consider the question of representation in and function of the House of Delegates, the committee to report to the Council.

The committee named by Chairman Eberle was: Messrs. Beringer, Whelpley and Stewart.

The proposition to form a Committee on Resolutions of ten members, five to be appointed by the President of the Association and five by the Chairman of the Council, as recommended by President Beringer, was, on motion, approved.

The suggestion to abolish the Historical Section was withdrawn.

The subject of the Women's Section was discussed.

The following letter from Miss Anna G. Bagley, Secretary of the Women's Section of the American Pharmaceutical Association (presented at the Council Meeting of August 24, 1914,) was read and discussed:

To the Members of the Council of the American Pharmaceutical Association:

Gentlemen:—Knowing that a motion is before Council to eliminate the Women's Section, the Secretary of the Women's Section begs to submit for the consideration of Council, this communication setting forth the views and desires of the women of that Section.

This matter was brought up in a discussion of reform for the conduct of the conventions and being wholly irrelevant to the discussion in hand, and unparliamentary, President Beringer moved to postpone action until the convention assembled. The charge of interference with other association affairs is absurd and needs no further comment.

As to the constitutionality of the Section: As we understand it the organic law of any organization is made up of the principles laid down in its constitution and the A. Ph. A. constitution empowers the Council to act on such matters as may be deemed good for the Association, whether it be the approval of an expense bill or the establishment of a new Section. Further, if we deny the right of Council to establish the Women's Section, then by the application of the same principle, the majority of Council proceedings become null and void. It would be a marvelous constitution indeed which could provide by specific mention for all matters which might come up for future consideration. And by the same application you destroy the House of Delegates, the Section on Pharmacopœias and Formularies, the Drug Trade Conference, the Commission on Patent Medicines, and most of the other progressive work which A. Ph. A. has done in the past few years.

Further, the acts of Council are subject to review by the Association. The Association has twice concurred in the establishment of the Women's Section; it was established by act of Council which was concurred in by the Association at Denver; it was confirmed by vote in the House of Delegates at Nashville, and the Association concurred in it, and it would seem that such a strong wish of the

body politic of the Association, twice expressed, would be respected, and sufficient to establish this Section for all time.

As to the non-professional women—It was fully understood when the Section was established and has been so understood when the matter has been discussed, that the Section was to be composed of both the non-professional women—those of your families who were willing to give to the advancement of A. Ph. A.—and the professional women who are already members of the Association.

These non-professional women do not expect any voice in Council, the House of Delegates, or representation in any voting capacity whatever, therefore the question of legality of their membership has no foundation.

With the question of legality removed, the argument then proceeds to the title of "Section," it being suggested that we be called auxiliary or given some other name of reduced rank.

The idea of a Women's Section originated in the Association and the women were invited to come into a "Section" it being understood that our privileges were limited as indicated above. So great were the loyalty of the professional women already members of the A. Ph. A. and so keen the interest of these non-professional, wide-awake women who have followed the fortunes of husbands, fathers and brothers in the practice of pharmacy, that when the call came, the answer was, "We are here. We are ready to work for A. Ph. A."

Through the title of "Section" you placed us in the ranks where we may work shoulder to shoulder with the members of A. Ph. A. to broaden its scope and help to win in some of the by-ways where the A. Ph. A. needs to exert its influence, but where it is too busy to spend its time.

We accepted the call, and perfected our organization at Nashville. But because we have endeavored to show a modesty becoming to a new Section, we have not heralded our plans and policies to the Association and for this reason, perhaps are misunderstood by some and looked upon as an unnecessary adjunct in an already over-burdened organization, and to disabuse the minds of any such members, we name a *few* of the things we hope to accomplish in the name of the A. Ph. A.

First, last and always our aim will be to secure members for the organization, both men and women. We now have a file of more than 500 women pharmacists in the United States with whom we are more or less in touch in soliciting membership. As to results: compared with the number of women who have been active in the work of the Women's Section, we have a much better showing in the number of members secured than has the rest of the membership of A. Ph. A.

We have a plan on foot for a nation-wide advertising campaign for A. Ph. A. through the medical and pharmaceutical press, the daily press, the organizations, the colleges, etc.

We shall aim to advance the cause of the woman pharmacist, help to guide the right kind of young people into the colleges of pharmacy, assist others in getting an education in pharmacy, etc., etc.

All such work would redound to the credit of A. Ph. A. but it can only be accomplished through the combined efforts of the non-professional and professional women.

Now, gentlemen, it makes a vast difference to this body of loyal women whether the name under which their efforts are made is "Section" or "Auxiliary."

The word auxiliary as applied to an organization signifies a hanger-on, a parasitical growth seeking its life from the host. Now this is just the opposite of what we propose to do. We want to work *with* you, side by side, *adding* to your strength, not sapping it, and to reduce us in rank not only will wound our self-respect, but will militate against the recognition accorded us both in the association and abroad.

Could we expect to approach strangers with any offer of service or ask for assistance and have any deference shown us as a body which the A. Ph. A. would

not have in its real ranks? No, but how different would be our reception as a "Section."

This, then, is what we ask of Council and the Association: That we be maintained as a "Section." We put the question frankly: Can the A. Ph. A. afford to dispense with this splendid service for the sake of a mere technicality, which of itself will avail them nothing?

Respectfully submitted,

ANNA G. BAGLEY, Secretary.

August 18, 1914.

Moved by H. B. Mason, seconded by G. M. Beringer, that the title of Women's Section be retained.

The following Committee on Revision of the By-Laws proposed at this meeting of the Council was named by the Chairman: Messrs. Mason, England and Nitardy, to report to the Association at its session on Friday at 7 p. m.

Adjourned until Wednesday, August 26, at 5 p. m.

J. W. ENGLAND, Secretary.

(FIFTH SESSION OF THE COUNCIL FOR 1913-14.)

The fifth meeting of the Council for 1913-14 was held on Wednesday, August 26, 1914, at 5 p. m., Chairman Eberle presiding.

Present: Messrs. Apple, Craig, Eberle, England, Fennel, Godding, Hopp, Mayo, Payne, Richardson, Seltzer, Stewart, Whelpley and Wulling.

The minutes of the previous meeting were read and approved.

On motion of L. A. Seltzer, seconded by H. M. Whelpley, Chapter 7, Article VIII, Section 2, was amended to read as follows:

Section 2: The Secretary of the Council shall submit the names of the candidates which have been proposed for membership, when a majority vote shall be sufficient to elect them.

J. C. Wallace presented the report of the Commission on Proprietary Medicines, as follows:

THE COMMISSION ON PROPRIETARY MEDICINES (Report of Progress)

To the Council of the American Pharmaceutical Association:

Gentlemen:—The resolutions creating the Commission on Proprietary Medicines which were adopted by your honorable body at the 61st annual meeting read as follows:

"That there is hereby created a standing committee, consisting of five members elected by the Council, to be known as the Commission on Proprietary Medicines.

Of the Commission first elected, the members shall be elected for terms of one, two, three, four and five years respectfully, and the vacancy annually occurring shall be filled by the election of a member for the term of five years. The Chairman of the Commission shall be annually designated by the Council, from the members of the Commission.

The duties of the Commission on Proprietary Medicines shall be:

(1) To inquire into and to report to the Council from time to time upon the general subject of proprietary medicines in their relations to pharmacy, medicine and the public health.

(2) To inquire whether any of the proprietary medicines commonly known as patent medicines, contain alcohol or habit-forming narcotic drugs in sufficient

amount to render them liable to create an alcohol or drug habit, or satisfy such habits when otherwise created.

(3) To inquire whether, or to what extent, the commonly advertised patent medicines contain potent drugs in sufficient amount to render them dangerous in the hands of the laity.

(4) To inquire into the extent to which patent medicines are fraudulently advertised, or differ in composition or origin from the claims made for them, or the extent to which they are advertised for the use of diseases for which no cure is known to medical science.

The Commission on Proprietary Medicines shall report progress annually to the Council, but no report or conclusion of the Commission shall be deemed as representing the views of the Association or Council until the same shall have been formally approved by the Association or Council. The Commission shall not make any expenditures of money, or create any debt against the Association in excess of such appropriations as may be made by the Council."

The membership of the Commission is as follows:

Thomas F. Main, New York City.....	Term expires 1914
James H. Beal, Chairman, Scio, Ohio.....	Term expires 1915
Martin I. Wilbert, Washington, D. C.....	Term expires 1916
John C. Wallace, New Castle, Pa.....	Term expires 1917
Chas. Caspari, Jr., Baltimore, Md.....	Term expires 1918

It will be noted from the resolutions that one member is to be elected annually for period of five years; that it is the business of the Council to annually designate the member of the Commission who shall act as Chairman.

The Commission organized for work in April of the present year by the selection of the following simple body of rules designed to facilitate discussion and parliamentary action by mail:

Rule 1. Motions and resolutions submitted for consideration by the Commission on Proprietary Remedies shall not require a second.

Rule 2. A motion to reconsider any action of the Commission may be offered by any member, whether such member voted for or against such action when originally taken.

Rule 3. Official letters from the Chairman to the Commission shall be known as circular letters, and shall be numbered and pagged consecutively.

Rule 4. Replies to Circular Letters, and motions or votes on matters contained therein shall be mailed not later than ten days from the date of such circular letters.

Rule 5. Motions, resolutions, and actions taken shall be consecutively numbered.

Except as above provided, the ordinary rules of parliamentary procedure govern the transactions of the Commission.

It was resolved that the work of the Commission for the first year should be largely of an exploratory nature, designed to bring under review the general subject of proprietary medicines and to develop general principles for the guidance of the Commission in its subsequent investigations.

As the first work, the formulation of definitions for the following subject was undertaken:

Proprietary Medicines, using that title in its widest sense, so as to include all varieties of proprietaries.

"Patent Medicines," so called.

"Ethical Proprietaries," so called.

Habit Forming Drugs and

Drug Habit.

While at first sight it might seem a simple matter to agree upon satisfactory definitions covering the above terms, experience has proven that quite a diversity of opinion is possible. Practically every member of the Commission has submitted one or more definitions for the above, and additional definitions have also been suggested by non-members of the Commission; judicial decisions have also been consulted so far as these have been available.

At the present time the members seem to be very nearly in accord upon definitions for each of the various terms considered; but, owing to delays in obtaining votes upon various motions, due no doubt to the absence of members on their vacations, the final vote upon the several propositions has not yet been taken; and these definitions are therefore not submitted for your approval at this time.

The Commission has also had up for consideration that class of prescription nostrums characterized by advertisement to the public under coined names designed to create the impression that the advertised nostrum is some well recognized drug or chemical compound that is to be obtained of the druggist and mixed with other popularly known medicaments either by the druggist or by the purchaser.

A preliminary vote has been taken upon a declaration covering this class of proprietaries, but as some additional suggestions have since been received it is thought wiser to resubmit this declaration, together with the proposed amendments for a new vote by the Commission before reporting the same to the Council.

The Commission also has before it for consideration a form of declaration designed to cover the case of formerly patented chemical products upon which the proprietors attempt to continue the monopoly once conferred by patent by the device of using their commonly accepted trade names as trade-marked titles.

In addition to the matters which have been already before the Commission for consideration, the Chairman has collected, through the medium of correspondence and by the examination of available literature, a considerable body of material bearing upon the various phases of the question, which will be placed in the hands of the Commission in the early future.

A "Parliamentary Commission on Proprietary Medicines," of the British House of Commons, during the past year has been considering practically the same questions as are included in the resolutions creating our Commission. This Parliamentary Commission has held a number of meetings, has examined numerous witnesses, and as a result has accumulated a considerable amount of information bearing upon the general subject, which has been embodied in a report recently made to the House of Commons. This report is designed to bring before the members of our Commission as soon as it is obtainable.

Future Work of the Commission—In order to inaugurate the work of the new year, it will be in order for the Council to elect a member of the Commission for five years, and to designate the Chairman of the Committee to act until the 1915 meeting.

The Commission recommends that there be an appropriation of \$25 for postage, stationery, and filing devices.

The resolutions under which the Commission acts, very properly provide that no action of the Commission shall be considered as the action of the Association until formally approved by the Council and, while this is undoubtedly quite proper, the Commission realizes that it would be possible to gather many valuable suggestions and much additional information if it were permitted to publish its tentative conclusions before their final formulation for presentation to the Council. We therefore ask permission to publish from time to time, in the official Journal, and elsewhere, such tentative propositions as we have under consideration, with a request for suggestions and information from all persons interested, in each case, to be accompanied by statements showing clearly that the proposi-

tions submitted are purely tentative and have not yet received the sanction of the Council or of the Association.

•Respectfully submitted,

J. H. BEAL, Chairman,
THOS. F. MAIN,
H. M. WHELPLEY,
JOHN C. WALLACE,
Commission.

The report was adopted.

Dr. F. E. Stewart presented a letter from Wallace Hatch, Superintendent of special Exhibits of the Panama-Pacific International Exposition, which reads as follows:

Dr. F. E. Stewart, Philadelphia, Pa.:

Dear Sir:—I have just received word from Mr. Jas. A. Barr, Director of Congresses, Panama Pacific International Exposition, that the American Pharmaceutical Association is to hold its 1914 meeting in Detroit, August 24th.

I think you will be interested to know—if you are not already familiar with the fact—that about two hundred and seventy-five different associations, representing many of the lines of work in which you are interested, will hold their 1915 session in or near San Francisco. It occurred to me that by bringing this matter to your attention you might be able to assist at the present convention in consummating arrangements for the 1915 gathering to be held here. Every effort is being made by the Exposition to assist both by special accommodations and by the grouping of scientific exhibits, to make sessions held in conjunction with the Exposition, of unusual value to all who are able to attend. Anything which you may be able to do toward enlisting the interest of this association, or any other with which you are connected, in favor of a 1915 session in San Francisco will be much appreciated by the Exposition and I think will be by your members.

I understand that Mr. J. H. Beal, of Scio, is secretary of the American Pharmaceutical Association. It is probable that he would have considerable influence in determining the place of meeting.

Dr. Albert Schneider is to represent the Exposition at the coming meeting on August 24th. It might be well for you to get in touch also with Dr. Schneider.

I am sending copy of this letter to the meeting in Detroit so that if the letter sent to your office does not reach you, the other may.

Very truly yours,

WALLACE HATCH,
Superintendent of Special Exhibits.

Dr. F. E. Stewart moved, seconded by C. A. Mayo, that a committee be appointed to consider the question of the American Pharmaceutical Association having an exhibit at the Panama-Pacific Exposition in 1915. The motion carried.

The committee named was Albert Schneider, Chairman; F. J. Wulling and E. Fullerton Cook.

Applications for membership from Nos. 405 to 429 inclusive were presented and the applicants elected. The list was as follows:

No. 405. Mrs. Alice Aldridge, 1816 N. Fourth St., Columbus, Ohio, rec. by Anna G. Bagley and Geo. B. Kauffman.

No. 406. Wm. S. Semones, 14 Market Square, Knoxville, Tenn., rec. by F. W. Ward and Ira B. Clark.

No. 407. John Gill Wafer, Homer, La., rec. by J. H. Beal and J. W. England.

No. 408. Edward Sewall Everett, 5 Bramhall St., Portland, Me., rec. by Chas. H. Davis and Alfred Page Cook.

No. 409. M. Van Vleet, 506 Gratiot Avenue, Detroit, Mich., rec. by Wm. A. Hall and Leonard A. Seltzer.

No. 410. Frederick Rohnert, 455 Jefferson Avenue, Detroit, Mich., rec. by Wm. A. Hall and Leonard A. Seltzer.

No. 411. Helen Ritz Burns, 22 E. Market St., Lewiston, Pa., rec. by Franklin M. Apple and Thos. F. Main.

No. 412. Harold Glendening, 1 Main St., Norwalk, Conn., rec. by Thos. A. Main and J. W. England.

No. 413. Stanley Herbert Collins, Lily, S. Dakota, rec. by Edward C. Bent and J. W. England.

No. 414. Hugh Stinson, Cor. Fourth and Douglas Sts., Des Moines, Iowa, rec. by E. O. Kagy and J. W. England.

No. 415. Ernest W. Westphal, Delmar Jct., Iowa, rec. by E. O. Kagy and J. W. England.

No. 416. Muzelle Powell, Klemme, Iowa, rec. by R. L. Parker and E. O. Kagy.

No. 417. Octavio Garcia, Mannabo, Porto Rico, rec. by R. L. Parker and E. O. Kagy.

No. 418. Arthur Lee Suter, 1295 Mardstown Road, Louisville, Ky., rec. by C. D. Porter and Geo. Eisele.

No. 419. Edward O. Rauchfleisch, 13419 Euclid Avenue, Cleveland, Ohio, rec. by Lewis C. Hopp and H. V. Arny.

No. 420. Peter Vellema, 5 Leonard St., N. W., Grand Rapids, Mich., rec. by J. C. Kirchgesson and Wm. A. Hall.

No. 421. Benjamin F. Nudd, Sgt. 1st cl., Hospital Corps, Field Hospital, No. 5, Texas City, rec. by H. W. Riess and John Duignan.

No. 422. Sinclair S. Jacobs, Jacobs' Pharmacy Co., Atlanta, Ga., rec. by George M. Beringer and J. W. England.

No. 423. Charles A. Rapelye, Hartford, Conn., rec. by T. F. Main and J. W. England.

No. 424. Frederick T. Bradt, 171 Blaine Avenue, Detroit, Mich., rec. by Wm. A. Hall and Leonard A. Seltzer.

No. 425. Hamilton C. Ulm, 224 Jackson St., Toledo, Ohio, rec. by Waldo M. Bowman and Azor Thurston.

No. 426. Paul H. Hirth, 271 Lincoln St., Detroit, Mich., rec. by Leonard A. Seltzer and William A. Hall.

No. 427. Joe L. Horn, 601 St. Louis Ave., Fort Worth, Texas, rec. by R. H. Needham and William B. Day.

No. 428. Howard T. Graber, 636 Trumbull Ave., Detroit, Mich., rec. by H. M. Whelpley and J. W. England.

No. 429. Jean Gordon, West Suburban Hospital, Oak Park, Ill., rec. by H. M. Whelpley and Franklin M. Apple.

The following resolutions, referred to the Council by the Section on Education and Legislation, were presented:

Whereas. It is currently reported that the Congress of the United States may impose a stamp tax on proprietary remedies and toilet preparations as a means of making good the deficit in revenue due to the European war, and

Whereas. The experience with a similar tax during the war with Spain was shown that the manufacturers almost universally increased their wholesale prices more than enough to cover the cost of the stamp tax, and

Whereas. This higher price to the retail dealer has, with a few exceptions, been continued even after the abolition of the stamp tax, with the effect that the retail dealer has continued to pay this Spanish war tax after its abolition, but has since that abolition paid it to the manufacturer instead of to the United States Government, and

Whereas, The war tax was not passed on to the public by an increase of the retail price except by the cut price stores in the larger cities, leaving the small retail druggists in residence neighborhoods and in smaller towns to pay this war tax out of their profits, and

Whereas, The result has been that this war tax has to a very large extent amounted to a special tax on a worthy though far from wealthy class of the small retail druggists, and

Whereas, The taxation of a special class is contrary to the best public policy; therefore, be it

Resolved, By the American Pharmaceutical Association that the imposition of a stamp tax on proprietary remedies and toilet preparations becomes in its enforcement class legislation of an objectionable nature, and be it further

Resolved, That the Congress of the United States be and is hereby petitioned not to impose a stamp tax on proprietary remedies and toilet articles, but to impose any stamp tax which may be necessary on checks, receipts, notes and similar commercial papers which would distribute the tax throughout the whole commercial world rather than restrict it to a limited class of dealers.

The resolutions were approved.

On motion of Dr. H. M. Whelpley, seconded by Dr. F. E. Stewart, Dr. George H. Schafer, of Fort Madison, Iowa, was nominated and elected Honorary President for 1914-15.

Adjourned until Friday, August 28, at 7:30 p. m.

J. W. ENGLAND, Secretary.

(SIXTH SESSION OF COUNCIL FOR 1913-1914.)

The sixth meeting of the Council for 1913-14 was held Friday, August 28, 1914, at 9 p. m., Chairman Eberle presiding.

Present: Messrs. Alpers, Apple, Asher, Beringer, Diehl, Godding, Havenhill, Koch, LaPierre, Mayo, Nitardy, Payne, Craig, Eberle, Koch, England, Richardson, Schneider, Seltzer, Whelpley and Wulling.

The minutes of the previous meeting of the Council were read and approved.

Credentials for delegates from the Iowa State Pharmaceutical Association, Michigan State Pharmaceutical Association and the Vermont State Pharmaceutical Association to the House of Delegates were presented and approved.

Applications No. 430 and 431 were presented and favorably acted upon by the Council.

No. 430. Chas. A. Lee, Med. Col. Va. School of Pharmacy, Richmond, Va., rec. by A. Bolenbaugh and L. E. Sayre.

No. 431. Albert Schneider, Batavia, Ill., rec. by H. M. Whelpley and J. W. England. (Membership with publication.)

The following communication was presented by C. Lewis Diehl, Reporter on the Progress of Pharmacy:

THE PRINCIPAL CAUSE OF DELAY IN THE PUBLICATION OF THE REPORTS ON THE PROGRESS OF PHARMACY.

To the American Pharmaceutical Association:—

Gentlemen:—The delay of the appearance of the "Year Book" of the Association for 1912 requires some explanation, but in no sense an apology from me, since it was due entirely to the circumstances beyond my personal control. The cause of the delay is, however, not far to seek.

In my last year's report on the status of the Reports on the Progress of Phar-

macy for 1912 and 1913—the one past due, the other to become due—I have explained that if, as I hoped, the decision reached at Boston in 1911, to publish the Report in a separate volume would be definitely reaffirmed at Nashville, we could confidently look for the appearance of the “Year Book” for 1912 shortly after the beginning of the present year, followed by the “Year Book” for 1913 early during the summer, and that hereafter we might confidently expect that the Reports would be ready for publication within a reasonably short time after the expiration of the year to which they apply. Incidentally, also, I explained that the delay in the publication of the Report of 1911 was mainly due to the inability of the printer to supply proofs with regularity, owing to the fact that the paucity of equipment in type necessitated that the composition be interrupted at certain intervals until the corrected forms were printed and the type again distributed.

These observations are here quoted because they illuminate the principal cause of delay in publication of the Report, and point out the way in which it may be avoided in future.

The Association having definitely decided to publish the Report in a separate volume, entitled “Year Book of the American Pharmaceutical Association,” it became necessary to select a publishing house to assume this task, this selection—under the rules of procedure—necessarily delaying the beginning of the composition of the text several months, notwithstanding that the manuscript for the Report had been finished for some time before the Nashville meeting, so that the first proofs did not reach me for correction from “The Stoneman Press,” Columbus, Ohio, to whom the contract was awarded, until October 18, 1913.

This firm being the official printer of the “Journal” of the Association, I had every confidence that the publication of the Year Book would proceed with regularity and dispatch, and this trust seemed justified, the galleys and page proofs alternating with fair regularity until December 13th, when galleys 80-88 were received *with the admonition that the compositor was ready for more “Copy.”* This admonition was the more astonishing because with galley 88 the sections on Pharmacy, Materia Medica and Inorganic Chemistry, comprising, as subsequently developed, 163 of a total of 480 pages of the entire text, had not yet been touched by the compositor. The Manager was at once notified of this defect, but, unaccountably to me, no new galleys were forthcoming until January 22, 1914, when the first galleys of Organic Chemistry came to hand, although page proofs 161-298 (a total of 138) had reached me during the interim *in two installments*.

Asking for an explanation, I was informed by the Manager that the work on the composition of the Report had been unavoidably side-tracked on account of unexpected work which could not be refused nor delayed.

Now, in what I have said, or will say further, I desire it to be distinctly understood that it is with no intention to find fault with the Stoneman Press or its Manager, Mr. Berlin, but with the single purpose of finding a remedy for the delay in the supply of proofs, and more particularly of the page-proofs which are needed for the index. Our relations, which have been confined to correspondence, have been most courteous throughout, and I should regret it exceedingly if these remarks were interpreted by them as evidence of a captious spirit. I feel sure that the delay mentioned is due to a misunderstanding between the proof reader's requirements on the one hand, and the convenience of the compositor on the other. In so far as the correction of the proofs is concerned, this is an easy matter and has been done promptly on all occasions, the corrected proofs being usually returned on the day they were received, and never later than the following morning. But it is of the utmost importance that the typesetting having once begun there should be no interruption in the regular supply of proofs and that the page-proofs should follow the galley-proofs in quick succession—in so far as this is practicable—and not allowed to accumulate be-

cause of the convenience of the compositor, or for any other avoidable reason. It must be remembered that the abstracts of references for the index cannot be made until the page-proofs are available. If these come in small numbers, corresponding to the galleys, the task of abstracting the references from them goes hand in hand with the correction; but if they are allowed to accumulate, as has been the case in the present experience, then it becomes absolute labor, which should not be inflicted upon the compiler of the index. I have taken some pride in the preparation of the indices for the Report of 1911 and 1912 and have endeavored in the latter to improve on the preceding by including an Index of Authors. This proved a strenuous task, however, which is emphasized by the fact that although the final page-proofs of the text were received on February 21st, and the alphabetical arrangement of the text not until February 26th, while the final page-proof of the Index (covering 44 pages) was not received and returned until April 27th. *And on June 2nd, (36 days later), I received my copy of the Year Book for 1912.*

The text for the Report for 1913 is practically complete and will be available shortly after the Annual Meeting, and I feel confident that on consultation with the Manager of the Stoneman Press we can arrive at an understanding whereby the faults and delays encountered in the past can be materially modified, if not completely obliterated, and that hereafter there will be no delay in the publication of the Year Book chargeable to this account.

Respectfully submitted,

C. LEWIS DIEHL.

Louisville, Ky., August 22, 1914.

The report was received and at the suggestion of J. W. England, Chairman of the Committee on Publication, it was referred to his committee.

The following communication was presented to the Historical Section by the Committee on Address of Chairman and Report of Secretary, and referred by the Section to the Council:

To the Historical Committee:

Gentlemen:—We wish to express our appreciation of the admirable address of our Chairman and have followed his recommendations with interest as to these.

We favor the compilation of the biographs of our members and will add that this compilation should include not only biographs of members, present and future, but also those who have passed away, and that as quickly as time will permit.

We approve of the collection of this historical matter in some central point and suggest that until the Home of the Association is built, some college located at a central point be invited to give us space, where articles and biographical records can be placed.

If these ideas are carried out the care of the exhibit and records will require more time than we could expect from a volunteer and we therefore recommend that a custodian, preferably the Historian of the Association, be recompensed.

As to the recommendations of the Secretary, we approve of the Historian requesting duplicate files of journals for the historical collection.

We do not deem it advisable that the Editor turn his journals over to the Historian since files of journals should be in the library of the editorial office. It would be better to request duplicates either direct from journals or as donations from members.

C. M. FORD,
H. V. ARNY.

The communication was received.

F. J. Wulling, on behalf of the College of Pharmacy of the University of Minnesota, subject to the approval of the President and Regents of the University,

offered to exhibit and care for, in its fireproof building, the historical property of the American Pharmaceutical Association without cost to the Association.

Lewis C. Hopp offered, on behalf of the Cleveland College of Pharmacy, quarters for the storage and exhibit of the historical collection of the Association.

On motion of H. M. Whelpley, seconded by J. A. Koch, the communication and the several offers were referred to the Council of 1914-15.

The following recommendation from the Section on Pharmacopœias and Formularies was presented and laid on the table:

"It is recommended that Petrolatum replace benzoinated lard as the vehicle in ointment of zinc oxide of the Pharmacopœia."

A recommendation from the Conference of Pharmaceutical Faculties, session of August 26, 1914, was read. It was as follows:

"Moved by Dr. H. M. Whelpley that the American Pharmaceutical Association be requested to define a College of Pharmacy as an institution, meeting the requirements of the Conference of Pharmaceutical Faculties."

On motion of G. M. Beringer, seconded by F. J. Wulling, the communication was referred to the Association.

The following letter was presented, and on motion referred to the Association:

To the Council:

Gentlemen:—Following are recommendations made by the Chairman of the Recipe Committee, H. P. Hynson, before the Section on Pharmacopœias and Formularies and referred to the Council.

It is recommended to the Association, as a whole, the recommendations to be referred for consideration, as may be the Association's pleasure, as follows:

1st. That a permanent committee on Recipe Book be provided for, composed of seven members, appointed by the Council, and that vacancies be filled by that body.

2nd. That the Committee be authorized to collect recipes according to such rules as it may adopt, provided such rules are endorsed by the Council, it being understood that amendments to these rules shall also be endorsed by the Council.

3rd. That as soon as after the publication of the ninth revision of the Pharmacopœia and the fourth edition of the National Formulary, as practicable, the Committee's collections of recipes shall be published as a separate supplement to an issue of the Journal and a copy be furnished to each member of the Association with the issue of the Journal to which it may be a supplement.

4th. That the matter of publishing the recipes thereafter in book form be referred to the Council with power to act.

E. FULLERTON COOK,

Chairman of Section on Pharmacopœias and Formularies.

The following was presented to the Council from the Syllabus Committee:

The Syllabus Committee recommend:

First. The approval of the Syllabus by this Association.

Second. The annual appropriation of \$25 towards the expenses of the Committee.

The first suggestion was referred to the General Session to consider in connection with the report of the Committee on President's Address.

The second suggestion of an appropriation of \$25 was granted.

The following communication was received:

To the Council of the American Pharmaceutical Association:

Gentlemen:—On behalf of the Committee on Unofficial Standards, I submit the following report:

During the year there has been reported to the Council a number of monographs that have been tentatively adopted and these have been published in the Journal in accordance with the instructions of the Council at the Nashville meeting.

A number of other monographs have been considered by the Committee and their acceptance will soon be voted upon, so that a supplemental report to the Council can be made very shortly.

There has been considerable delay in our work because we have been awaiting the decisions of the Pharmacopœial Revision Committee as to the admission or deletion of quite a number of titles. These now appear to be definitely settled and we will have a basis for the additional work necessary for the N. F. standards.

The Chairman of the Committee accepts full responsibility for the delay of this year in the work of the Committee. The demands of other duties prevented him from giving the amount of attention to this Committee that it deserved. Being now relieved from other duties, he hopes to be able to take this up energetically and see that the work as far as the N. F. standards are concerned is completed at an early date.

Respectfully submitted for the Committee,

GEORGE M. BERINGER.

On motion of J. A. Koch, seconded by H. M. Whelpley, an appropriation of \$400 was made with which to pay the traveling expenses of the members of the Committee on National Formulary.

The complete report of the Committee on Publication and a supplemental report were presented. The former report was presented to the Council on the 24th inst., but the recommendations then made, with reference to the selection of a new Editor and General Secretary, that the matter be left to the Committee on Publication with power to act, was modified by eliminating the words, "General Secretary."

The supplemental report of the committee was as follows:

To the Members of the Council:

Gentlemen:—The Committee on Publication has asked for bids for the composition, electrotyping, printing and binding of the National Formulary, Fourth Edition, from the same printers as were asked to bid for the U. S. Pharmacopœia, Ninth Edition, and upon similar forms and specifications.

We recommend that the contract be awarded to the J. B. Lippincott Co., of Philadelphia, Pa., as the lowest and best bidder.

We recommend, also, that the Committee on Publication be authorized to invite bids for the agency and also of the National Formulary, Fourth Edition, along the lines of the forms and specifications used for the U. S. Pharmacopœia, Ninth Revision, and award the contract.

J. W. ENGLAND,

August 27, 1914.

Chairman of Committee on Publication.

The reports were received.

The recommendation that the matter of selecting an Editor be left to the Committee on Publication with power to act, subject to the approval of the Council, was approved.

The offer of the Lloyd Library was accepted.

On motion of G. M. Beringer, seconded by C. A. Mayo, the awarding of the

contract for the composition, electrotyping, printing and binding of the National Formulary (1V) to the J. B. Lippincott Company, of Philadelphia, was approved, and the Committee on Publication was empowered to make the necessary contract as soon as possible.

On motion of Philip Asher, seconded by F. M. Apple, the Committee on Publication was authorized to secure bids and make the necessary contract for the business agency and sale of the National Formulary, Fourth Edition.

The election for officers for the ensuing year was then held, the following being chosen:

General Secretary—William B. Day.

Treasurer—Henry M. Whelpley.

Reporter on the Progress of Pharmacy—C. Lewis Diehl.

Historian—Eugene G. Eberle.

The selection of a Local Secretary was referred to the Council of 1914-15.

Adjourned until Saturday, August 29, 1914.

J. W. ENGLAND, Secretary.

(SEVENTH SESSION OF THE COUNCIL FOR 1913-1914.)

The seventh session of the Council was held on Saturday, August 29, 1914, at 9 a. m., Chairman Eberle presiding.

Present: Messrs. Craig, England, Fennel, Godding, Hopp, LaPierre, Mayo, Nitardy, Richardson, Ruddiman, Seltzer, Whelpley and Wulling.

The following resolutions were passed by the House of Delegates and referred to the Council:

1. That the House of Delegates endorse the aims and purposes of the Chicago Veteran Druggists Association and recommend the formation of similar associations as Sections of the Local Branches of the A. Ph. A., provided that the members of such Association shall be also members of the American Pharmaceutical Association.

Decision: Approved.

2. That the American Pharmaceutical Association instruct its representatives in the National Drug Trade Conference to act immediately in connection with the representatives of the allied branches of the drug trade in the Drug Trade Conference to draft at the earliest possible moment a bill to reform the present patent law, registration of names of drugs and the granting of sole right to sell certain drugs to the people of the United States suitable to the best interests of the drug trade in the United States, and to urge its passage at the earliest possible opportunity, and the support of the A. Ph. A. is hereby pledged to such reform.

Decision: Approved.

3. That the A. Ph. A. make all possible effort to have only graduates of recognized schools of pharmacy nominated as members of the State Boards of Pharmacy by the State Associations and where possible have such amendments made to state laws as will make such qualifications a prerequisite.

Decision: Approved.

4. That the incoming president be and is hereby instructed to appoint a committee of three members, which committee shall confer with similar committees, appointed for the same purpose by other organizations, upon the advisability of forming a congress of national drug and pharmaceutical bodies under the auspices of the American Pharmaceutical Association. And be it further Resolved, That the results of the conference of these committees shall be reported to the several organizations represented and to the American Pharmaceutical

Association at their annual meetings in nineteen hundred and fifteen, with such recommendations as may be agreed upon.

Decision: Approved.

5. Whereas, The usefulness of the House of Delegates during its two years' existence, not having been such as was expected at the time of its installation, it is important that something be done to increase this usefulness; therefore, be it Resolved, That it is the sense of this House of Delegates that increased efficiency can be secured by making this body a permanent one instead of making its existence dependent upon the actions of the Council.

Decision: Referred to the Committee on House of Delegates appointed by the Council.

6. That it is the belief of the House of Delegates that the Year Book should contain abstracts of papers submitted by the members of the American Pharmaceutical Association and published in the Journal of the American Pharmaceutical Association.

Decision: Referred to the Committee on Publication with power to act.

7. That the President of the American Pharmaceutical Association, at the opening session of each annual convention, shall appoint an official censor whose duty it shall be to supervise matter given to representatives of the local press, and to insure that fair and accurate accounts of the proceedings and business of the Association during such meetings shall be fairly and accurately printed.

The subject of convention publicity received extended discussion.

F. J. Wulling moved, seconded by L. A. Seltzer, that the publicity work of the Association should be composed of two divisions: (1) preconvention work, (2) convention work.

(1) The preconvention work should be done by the Local Committee.

(2) The Convention work should be done by a committee composed of an Association Reporter, as Chairman, and the Chairmen of the several Sections of the Association and the General Secretary and Secretary of the Council as members who should report briefly in writing the proceedings and news of the several bodies to the Reporter, who should be the channel of communication to the press.

The motion was adopted.

8. That the principle in these two measures—the Metz Bill and the Stevens Bill, i. e., price standardization, be approved by this Association.

Decision: Adopted.

A vote on Motion No. 42 of Council Letter No. 27 on offer of Wm. S. Merrell Co., for assignment of patent rights for improved package for antiseptic poisons (which was an amendment of Motion No. 41 of Council Letter No. 26 on Assignment of Patent Rights for Improved Package for Antiseptic Poisons) was called for by J. A. Koch, seconded by C. A. Mayo, and the original motion was amended and as a whole was adopted.

The following applications for membership were presented and favorably acted upon:

No. 432. Geo. E. Doyle, 1190 West Fort St., Detroit, Mich., rec. by Wm. A. Hall and J. W. England.

No. 433. Adelbert P. French, 2782 Woodward Ave., Highland Park, Mich., rec. by Wm. A. Hall and Leonard A. Seltzer.

On motion of H. M. Whelpley, seconded by J. A. Koch, the traveling expenses of the Secretary of the Council for this meeting were directed to be paid. The expenditure met with the approval of the Committee on Finance.

On motion of H. M. Whelpley, seconded by J. W. England, it was agreed that the Rules of Finance be so amended that the Committee on Finance shall audit all bills before payment is made.

J. A. Koch moved, seconded by F. J. Wulling, that the Acting General Secretary be requested to confer with the General Secretary elect, and arrange for the transfer of the property of the Association belonging to the secretarial office as soon as possible, and that the salary of the General Secretary elect be seven hundred and fifty dollars per annum and date as of September 1, 1914.

Adjourned.

J. W. ENGLAND, Secretary.

(FIRST SESSION OF THE COUNCIL FOR 1914-15.)

Immediately after the adjournment of the seventh session of the Council for 1913-1914, the first or organization meeting of the Council for 1914-15 was held on Saturday, August 29, 1914, at 10 a. m.

Chairman Eberle presided as Acting Chairman.

Present: Messrs. Whelpley, Wilbert, Eberle, Godding, Day, Shafer, Wulling, England, Hopp, Osseward and Mayo.

The following officials were elected:

Chairman—E. G. Eberle.

Vice Chairman—John G. Godding.

Secretary—J. W. England.

The Chairman and Secretary of the Council were named as the Committee on Nomination of Council Committees for 1914-15 to report to the Council later.

Adjourned.

J. W. ENGLAND, Secretary.

PROCEEDINGS OF THE HOUSE OF DELEGATES OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

Sixty-second Annual Meeting, Detroit, Michigan, August 24th to 28th, 1914.
(First Session.)

The first session of the House of Delegates was called to order August 24th, at 8 o'clock p. m. in room "C" of the Convention Hall of the Hotel Pontchartrain.

The meeting was called to order by Chairman Clyde M. Snow, of Chicago.

The Chairman stated that the first order of business was the calling of the roll of delegates whose credentials had been approved by the Council, but that unfortunately the Council up to that time had not presented the roll of delegates whose credentials had been approved.

Chairman Snow stated he had discussed in a general way with some of the members the measures it would be best to adopt in the House of Delegates, and it seemed to be the opinion of the delegates in the room, at least, that the meeting proceed with the order of business so far as it can. It had been suggested that the Committee on Resolutions will have but little time to consider proposed resolutions, and it seemed well that the meeting should at least appoint a Committee on Resolutions and receive as many of them as possible from the members present.

Chairman Snow stated that under the Constitution and By-laws of the House of Delegates the second order of business was the election and installation of officers, but at the meeting at Nashville, the order of business was amended to make the election and installation of officers sixth in order instead of second, and that inasmuch as the credentials have not been approved by Council, the next order of business will be No. Three, the appointment of the Committee on Resolutions.

The Chairman then appointed as a Committee on Resolutions, William Mansfield, New York, Henry M. Faser, University, Miss., Cornelius Osseward, Seattle, Wash., Fred W. R. Perry, Detroit, Mich., Wm. B. Day, Chicago.

The Chairman then called for the fourth order of business, the reading of communications from the Association Sections and the Council. The Secretary reported that none had been received.

The Chairman then called for the fifth order of business, Reports, Resolutions, and Communications from the delegates.

Mr. Wilhelm Bodemann, of Chicago, offered the following resolution:

That the House of Delegates endorse the aims and purposes of the Chicago Veteran Druggists' Association and recommend the formation of similar associations as Sections of the Local Branches of the A. Ph. A., provided that the members of such Association shall be also members of the American Pharmaceutical Association.

The Chairman stated if there was no objection the resolution would be referred directly to the Committee on Resolutions.

Mr. George F. Payne, of Atlanta, Ga., inquired as to how old the applicants were required to be before they could be received into the membership of the Veteran Association. Mr. Bodemann replied that he had to be allied with pharmacy for a period of twenty-five years.

The Chairman then called for further resolutions from the delegates present.

Mr. Nitardy presented the following resolution:

Resolved, That the A. Ph. A. make all possible efforts to have only graduates of reputable schools of pharmacy nominated as members of State Boards of Pharmacy by State Associations, and where possible, have such amendments made to state laws as will make such qualifications a pre-requisite."

Mr. W. C. Alpers, of Cleveland, Ohio, stated he did not wish to oppose the motion, but desired to call the attention of the members present to the fact that the resolution might be unconstitutional. Under the state laws, certain persons are eligible to hold a position on the Board of Pharmacy. A man who is a licensed druggist has the same standing as though he held a college diploma, and the question was determined by the laws of the several states. He was in full accord with the desirability of the law, but he thought the result would not be attained in the manner proposed. The advisable thing would be to secure the passage of the pre-requisite law in every state, so that, in time, only druggists who are graduates of colleges would be eligible to the Boards, but the present members could not be legislated out of their rights. Mr. Alpers said he only mentioned this to obtain an expression of opinion.

Mr. R. H. Walker, of Gonzales, Texas, said he thought the proposition was, as offered, a violation of state rights. You could not make New York or any other state adopt it if they did not want to. The legislation proposed was a state matter and if a date were named when it should take effect that most of the

states would encourage its passage. For instance, at the present time a proposed amendment was being considered by the Legislature in Texas which if passed would take full effect in 1920. It provides that no person could be a member of the Board of Pharmacy unless he were a graduate of a reputable college, and the amendment defines a reputable college. The State Association is favoring this amendment, but they realized that you have to bring about such a reform gradually: the first step will be made in 1916, a further step in 1918 and by 1920 a person will have to be a full fledged pharmacist, to be a member of the Board of Pharmacy in Texas. He hoped the measure would be passed and they were all working with that end in view.

Mr. Chas. M. Ford, of Denver, Col., stated it was well known that there were men on some state boards of pharmacy who are not pharmacists and that this whole subject had been covered by the President in his address and had been referred to the Committee on President's Address and therefore this question, in a very elaborate and fundamental way, was before that committee. He thought the matter had been so well covered by the President that it could be dropped.

Mr. P. A. Mandabach, of Chicago, suggested that there be interjected in the resolution that it was the sense of this body to recommend to the various state associations, that they select for future appointments graduates in pharmacy, stating he believed this would eliminate the chief contention.

Mr. C. Osseward, of Seattle, said that Washington did not have such a law, but the State Board has made a ruling that, under the pharmacy law of that state, the Board has the right to prescribe the preliminary education of students, and they had made the ruling that the preliminary education required is a three-year college course, and next month the first examination would be held under this ruling.

Mr. Nitardy explained to Mr. Osseward that his resolution did not have reference to the preliminary education of pharmacists, but simply had reference to the qualifications for membership on Boards of Pharmacy.

Mr. Chas. T. P. Fennel, of Cincinnati, said he thought the proposed resolution would be absolutely unconstitutional; that in the first place, every Governor of every state had a right to appoint whoever he saw fit as a member of the Board of Pharmacy, whether he was a pharmacist or not, although the State Association could recommend, the Governor could go outside the recommendation and did so occasionally. He did it in the State of Ohio and the matter was fought through the courts to the Supreme Court of the state and Governor Hoadley was upheld; the court deciding that the Governor had the right to go outside the recommendation; and he believed that Governor Dean, of Illinois, had done the same thing.

Mr. Gordon said he could not see that the recommendation was unconstitutional. It simply recommended that the American Pharmaceutical Association do all it can to bring this about and asked Mr. Nitardy if that were not correct. Mr. Nitardy replied that it was, and said there was nothing unconstitutional about it. The Governor's power of appointment under the proposed resolution was simply limited to the appointment of graduates of schools of pharmacy as members of the Boards of Pharmacy.

Prof. Albert Schneider, of San Francisco, said he had been very much inter-

ested in the discussion with regard to the powers of the Governor. He asked what could be done with the chief executive of a state who absolutely refused to make any appointments whatsoever. He said that the Governor of California had absolutely refused to appoint any member on any board, either old members or new members, and he believed Illinois had had some such experience.

Mr. Whelpley moved the reference of this resolution to the Committee on Resolutions; motion adopted.

Mr. Frederick T. Gordon then submitted the following resolution:

"Resolved, That the American Pharmaceutical Association instruct its representatives in the National Drug Trade Conference to act immediately in connection with the representatives of other allied branches of the drug trade in the drug conference, and to draft at the earliest possible moment a bill to reform the present patent laws of the United States suitable to the best interests of the drug trade of the United States, and to urge its passage at the earliest possible opportunity, and that the support of the American Pharmaceutical Association is hereby pledged to such reform."

Referred to the Committee on Resolutions.

Mr. Hynson said he was very serious in what he was about to offer and he asked for the sincere and earnest thought of all the delegates. Mr. Hynson said he wanted to say by way of explanation that he had the greatest respect for the House of Delegates as a House of Delegates, representing so many pharmacists throughout the United States, and that he also had great respect for the organization of pharmacy from a national standpoint; that it had been his duty to study national organization and he had found that pharmacy as a whole is beautifully and wonderfully organized—unusually well organized; that every interest of pharmacy that he knew of, except possibly the errand boy and the scrub woman, was organized into a splendid national organization, and he thought it was time now, under the auspices of the American Pharmaceutical Association for those national associations to be correlated into a body to treat upon subjects of general import.

He offered the following amendment to the Constitution and By-Laws of the House of Delegates:

AMENDMENT TO BY-LAWS.

"Amend Chapter 2, Article 1, to provide that: the representation or the membership of the House of Delegates shall consist of three regularly elected or appointed delegates from each of the several pharmaceutical associations, all of whom shall be members of the American Pharmaceutical Association."

In discussing his amendment Mr. Hynson said he had the greatest respect for every delegate present; that he had great respect for every representative present and for every Association that was represented in the House of Delegates, but that it was an unequal representation; that the National Associations, International Associations, medical societies, local societies, state societies, local branches and every other body that he knew of, were well represented except the State Associations. The local branches were now represented in the Council, and the national associations should be represented in that senate, meaning the Council. There were but few other scattering bodies and there might be some great associations who would send their delegates to the general session of the American Pharmaceutical Association. Mr. Hynson asked them to think over the matter and stated, in his opinion, it would be a fine thing if all the members of the House

of Delegates were equal members and there was an exact equality of members, each member representing his state association.

Mr. Hynson assured the members that he had no object in this other than to help the profession which he had worked and labored in, and to make it better for those who are to follow, and a more honorable profession in every way.

Mr. Hynson further said in support of his amendment that, while there might be delegates who felt that other associations should be represented in the House of Delegates, they would never have an effective, active, working body unless they had equal representation, a representation equally responsible and consisting of delegates of equal power.

Mr. Hynson also offered the following resolution:

"Resolved, That the incoming President be, and he is hereby instructed to appoint a committee of three members, which committee shall confer with similar committees appointed for the same purpose by other organizations to consider the advisability of forming a congress of national drug pharmaceutical bodies under the auspices of the American Pharmaceutical Association; and

"Be It Further Resolved, That the results of the conference of these committees shall be reported to the several organizations represented, and to the American Pharmaceutical Association at their annual meetings in 1915,—most of which will be held in San Francisco, with such recommendations as may be agreed upon."

Mr. Hynson stated there was nothing radical or secret about this matter. It had simply been evolved in his mind and in the minds of a great many others, that these great associations which are so well organized and so well represent pharmacy in all its branches, should be correlated in some concrete body, and as he proposed, that body should consist of three representatives from each national association, and he believed a great deal of good would come out of it; that this was simply a matter to be passed on to the Committee on Resolutions, and the amendment to the By-laws should be taken up at a subsequent session.

The Chair then stated that he trusted the delegates all understood that Prof. Hynson had brought up two matters, one being an amendment to the Constitution and By-laws of the House of Delegates, which could be voted upon at the next meeting, and that the resolution which he had offered, unless there were objections, would be referred to the Committee on Resolutions.

Mr. Whelpley took the floor and requested that every one register so they could get on the official record; also made an announcement as to the button of the Association.

The House of Delegates then adjourned to 7:30 p. m., Tuesday, August 25, 1914.

SECOND SESSION.

The second session of the House of Delegates was held August 25th, 1914, at 7:30 p. m. in Room C. of the Convention Hall of the Hotel Pontchartrain.

The first order of business was the calling of the roll of delegates, as follows:

Bureau of Medicine—Willard G. Steadman, Jr., U. S. Navy, Navy Recruiting Station, Detroit.

Bureau of Chemistry—Dr. George W. Hoover.

Bureau of the Public Health Service—M. I. Wilbert, Washington, D. C., Dr. G. A. Morris.

Department of Commerce Bureau of Standards—Dr. F. A. Wolff.

American Medical Association—Dr. R. Sollman, Dr. A. H. Hewlitt, Prof. W. A. Puckner.

The American Association Pharmaceutical Chemists—E. N. Webb, Columbus, O., Ralph R. Patch, Boston, Mass., J. Weinkauff, Chicago, Ill. *Alternates*—Dr. C. H. Searle, Dr. O. S. Burdick, F. A. Thompson.

Cuban Pharmaceutical Association—Gerardo Fernandez Abreu, F. Herrera.

National Association Boards of Pharmacy—T. A. Miller, Richmond, Va., J. W. Gayle, Frankfort, Ky., F. C. Dodds, Springfield, Ill.

National Association of Drug Clerks—P. A. Mandabach, Chicago, Chas. H. Bowersox, Columbus, Ohio, Milo Miller, Mansfield, Ohio.

National Association, Manufacturers of Medicinal Products—Chas. M. Woodruff, Detroit, Mich., Dr. A. R. L. Dohme, Baltimore, Md., B. L. Murray, New York City, N. Y.

National Association Retail Druggists—Chas. F. Mann, Chairman, Detroit, Wilhelm Bodemann, Chicago, Ill., William S. Flint, Boston, Mass.

National Wholesale Druggists' Association—James E. Davis, Detroit, F. E. Bogart, Detroit, Lee M. Hutchins, Grand Rapids.

New Orleans C. P. Alumni Association—Norman C. Richards, Ph. G., New Orleans, John B. Murphy, Ph. G., New Orleans.

Massachusetts College of Pharmacy, Alumni Association—Frederick W. Archer, Dorchester, Jennie H. Summer, I. P. Gammon.

Alumni Association College of Pharmacy City of New York—Thomas F. Main, New York.

Albany College of Pharmacy—Alfred B. Husted, Wm. A. Larkin.

Brooklyn College of Pharmacy—Dr. Wm. C. Anderson, Dr. Henry W. Schimpf, Dr. Jacob H. Rehfuß.

Buffalo College of Pharmacy—Willis G. Gregory, Frank E. Lock, Albert P. Sy.

Cincinnati College of Pharmacy—Chas. T. P. Fennel, Fred S. Kotte, Chas. F. Harding.

Colorado School of Pharmacy—Homer C. Washburn, John B. Edeley, Francis Ramaley.

Creighton College of Pharmacy—Prof. I. Curtis Arledge, Herbert F. Gerald, M. D.

Illinois School of Pharmacy—C. M. Snow, Chairman, A. H. Clark, E. N. Gathercoal.

Iowa College of Pharmacy—Wilber J. Teeters, R. A. Kuever, Zada M. Cooper.

Jersey City College of Pharmacy—Otto Raubenheimer, Ph. D.

Kansas School of Pharmacy—L. D. Havenhill, G. N. Watson, L. E. Sayre.

Louisville College of Pharmacy—C. Lewis Diehl, Ph. M., John D. Lansing, Ph. G., Wm. Votteler.

Maryland College of Pharmacy—Henry P. Hynson, E. Frank Kelly, Chas. Caspari, Jr.

Massachusetts College of Pharmacy—Theo. J. Bradley, Elie H. LaPierre, John G. Godding.

Michigan School of Pharmacy—J. O. Schlotterbeck, A. B. Stevens, W. S. Hubbard.

Minnesota College of Pharmacy—Frederick J. Wulling, Edwin L. Newcomb, Gustav Bachman.

Nebraska School of Pharmacy—Rufus A. Lyman, Elsie Day.

New York College of Pharmacy—Geo. C. Diekman, Chairman, H. H. Rusby, M. D., Harry V. Arny, Ph. D. *Alternates*—Ewen McIntyre, Ph. G., Chas. Holzhauser.

Ohio Northern College of Pharmacy—D. C. Mohler, Rudolph Raabe.

Ohio College of Pharmacy—Clair A. Dye, Edward Spease, Geo. B. Kauffman.

Oklahoma School of Pharmacy—Chas. H. Stocking.

Philadelphia College of Pharmacy—Joseph P. Remington, F. X. Moerk, Chas. LaWall. *Alternates*—E. F. Cook, E. P. Stroup.

Pittsburgh College of Pharmacy—J. A. Koch, J. H. Beal, J. C. Wallace.

Purdue School of Pharmacy—C. P. Jordan, A. H. Dewey, W. F. Gidley.

St. Louis School of Pharmacy—Prof. Chas. E. Caspari, H. M. Whelpley, M. D., Prof. Alfred W. Pauley.

Texas Christian University, Medical Department—R. H. Needham, Cassius C. Martin, Chas. L. Taylor.

Valparaiso School of Pharmacy—Geo. D. Timmons, Eber H. Wisner, Mason L. Weems.

Vanderbilt University Department of Pharmacy—E. A. Ruddiman, J. T. McGill, M. E. Hutton.

Virginia School of Pharmacy—Albert Bolenbaugh, Chairman, Wortley F. Rudd, Chas. O. Lee.

George Washington University Department of Pharmacy—Henry E. Kalusowski, Willard S. Richardson, Lewis Flemer.

Cleveland School of Pharmacy—W. C. Alpers, W. T. Hankey, Lewis C. Hopp.

Pharmacy Department Detroit Technical Institute—B. D. Edwards, W. Ward, Ph. G., R. T. Lakey, B. Sc.

Northwestern University School of Pharmacy—John H. Long, Harry M. Gordin, Maurice A. Miner.

Highland Park College of Pharmacy—E. O. Kagy, R. L. Parker.

Medico-Chirurgical College of Philadelphia—J. W. Sturmer, C. E. Vanderkleed. *Alternates*—Dr. F. E. Stewart, Paul S. Pittenger.

STATE ASSOCIATIONS.

Alabama Pharmaceutical Association—L. C. Lewis, Tuskegee, Ala., Carl Whorton, Gadsden, Ala., S. L. Toomer, Auburn, Ala.

Colorado Pharmaceutical Association—F. W. Nitardy, Denver, Colo., C. M. Ford, Denver, Colo.

Connecticut Pharmaceutical Association—Chas. A. Rapelye, Hartford, Conn., P. T. Garvin, Bethel, Conn., Arthur E. Lathrop, Simsbury, Conn.

Delaware Pharmaceutical Society—Herbert J. Watson, Newark.

Florida State Pharmaceutical Association—Macon Thornton, Ormond; E. Berger, Tampa, W. J. Maloy, White Springs.

Georgia Pharmaceutical Association—Dr. Walter L. Meadows, Columbus, Ga., Dr. G. B. George, Gainesville, Ga., Dr. Ben S. Persons, Macon, Ga.

Illinois Pharmaceutical Association—C. H. Avery, Chicago, Ill., J. C. Wheatcroft, Greyville, Ill., W. B. Day, Chicago, Ill.

Indiana Pharmaceutical Association—Chas. A. Jordon, Lafayette, Ind., Frank H. Carter, Indianapolis, Ind., Geo. D. Timmons, Valparaiso, Ind.

Kansas Pharmaceutical Association—Mathias Noll, Atchison, Kan., W. E. Sherriff, Ellsworth, Kan., L. E. Sayre, Lawrence, Kan.

Kentucky Pharmaceutical Association—C. Lewis Diehl, Louisville, Ky., L. A. Brown.

Pennsylvania Pharmaceutical Association—Louis Emanuel, Pittsburg, Pa.

South Carolina Pharmaceutical Association—Sam Hodges, Greenwood, S. C., J. P. Glenn, Jr., Liberty, S. C., C. H. McMurray, Abbeville, S. C.

South Dakota Pharmaceutical Association—Edward C. Bent, Dell Rapids, S. D., Geo. F. Swartz, Red Field, S. D.

Tennessee Pharmaceutical Association—F. W. Ward, Memphis, Tenn., M. E. Hutton, Nashville, Tenn., J. L. Sonner, Knoxville, Tenn.

Texas Pharmaceutical Association—E. G. Eberle, Dallas, Texas.

Utah Pharmaceutical Association—John Culley, Ogden, Utah.

Virginia Pharmaceutical Association—T. A. Miller, Richmond, Va., Geo. T. Mankin, Falls Church, Va., E. S. Eley, Suffolk, Va.

Washington Pharmaceutical Association—Dr. C. W. Johnson, Seattle, C. Osseward, Seattle.

Wisconsin Pharmaceutical Association—Edward Kremers, Madison, Wis., Otto J. S. Boberg, Eau Claire, Wis., Geo. H. Kesten, Milwaukee, Wis.

District of Columbia Retail Druggists' Association—F. T. Stone, Washington, D. C., Lewis Flemer, Washington, D. C.

California Pharmaceutical Association—Mrs. Fletcher Howard, W. H. Guest, Dr. Albert Schneider.

New York County Pharmaceutical Society—J. Leon Lascoff, Otto Raubenheimer, Thomas Latham.

New Yorker Deutscher Apotheke Verein—Prof. Otto Raubenheimer, Geo. T. Riefflin, Prof. Harry V. Army.

Vermont State Pharmaceutical Association—C. H. Skinner, E. G. McClallen.

King's County Pharmaceutical Society—Wm. C. Anderson.

Kentucky Pharmaceutical Association—C. Lewis Diehl, Louisville, Ky., L. A. Brown, Lexington, Ky., Robin H. White, Mt. Sterling, Ky.

Maine Pharmaceutical Association—Frank H. Tupper, Chairman, Martin L. Porter, Danforth, Me., Chas. H. Davis, Bangor, Me., W. J. Jackman, by proxy.

Maryland Pharmaceutical Association—Dr. Henry P. Hynson, Baltimore, Md., Dr. John F. Hancock, Baltimore, Md., Dr. D. R. Millard, Baltimore, Md.

Massachusetts Pharmaceutical Association—Arthur C. Morey, Brookline, Mass., Prof. C. F. Nixon, Leominster, Mass.

Minnesota Pharmaceutical Association—J. Eckstein, Clear Lake, Minn., Frederick J. Wulling, Minneapolis, Minn., W. A. Frost, St. Paul, Minn. *Alternates*—H. Martin Johnson, St. Paul, Edwin L. Newcomb, Minneapolis, Minn.

North Dakota Pharmaceutical Association—J. S. Miller.

Missouri Pharmaceutical Association—Chas. E. Zinn, Wm. Mittelbach.

Nebraska Pharmaceutical Association—N. P. Hansen, Lincoln, Neb., D. J. Fink, Holdrege, Neb., Autumn V. Pease, Fairbury, Neb.

New Hampshire Pharmaceutical Association—N. S. Whitman, Nashua, N. H., John I. Hoyt, Penacook, N. H., Dante Smith, Manchester, N. H.

New Jersey Pharmaceutical Association—Geo. M. Beringer, Camden, N. J., Chas. Holzhauser, Newark, N. J., Geo. M. Andrews, Woodstown, N. J. *Alternate*—Jeannot Hostman.

New York Pharmaceutical Association—Caswell A. Mayo, Brooklyn, N. Y., Albert B. Husted, Delmar, N. Y., Joseph Weinstein, New York, N. Y.

North Carolina Pharmaceutical Association—E. V. Howell, Chapel Hill, N. C., E. V. Zoeller, Tarboro, N. C., G. P. Greyer, Morgantown, N. C.

Ohio Pharmaceutical Association—Chas. L. McIntyre, St. Marys, Ohio, Edward Thiesing, Cincinnati, Ohio, Chas. S. Ashbrook, Mansfield, Ohio.

Oklahoma Pharmaceutical Association—Winfield Scott Samuels, Pawuska, Okla.

Pennsylvania Pharmaceutical Association—Louis Emanuel, Pittsburgh, Pa., Chas. H. LaWall, Philadelphia, Pa., Joseph L. Lemberger, Lebanon, (Chairman).

Boston Association of Retail Druggists—Elie H. LaPierre, C. Herbert Packard, John G. Godding.

Syracuse Drug Association—David Stolz.

BRANCHES.

Chicago Branch American Pharmaceutical Association—Wilhelm Bodemann, William Gray, I. A. Becker.

Cincinnati Branch—Theo. D. Wetterstroem, F. H. Freericks, C. G. Merrell.

Columbus Branch American Pharmaceutical Association—Edward Spease, M. N. Ford, Geo. T. Lehman.

Denver Branch American Pharmaceutical Association—Prof. H. C. Washburn, Hugh SeCheverell.

Nashville Branch American Pharmaceutical Association—Dr. E. A. Ruddiman, Dr. J. M. Rogoff, F. W. Ward.

New England Branch American Pharmaceutical Association—Carlton B. Wheeler, Fred A. Hubbard, Wm. A. Glover.

New York Branch American Pharmaceutical Association—Caswell A. Mayo, J. Leon Lascoff, Dr. Jeannot Hostmann.

Northwestern Branch American Pharmaceutical Association—D. F. Jones, Watertown, S. Dak.

St. Louis Branch American Pharmaceutical Association—Glenn A. Burkhart, Theodore C. Hagenow, A. W. Pauley.

Washington City Branch American Pharmaceutical Association—W. S. Richardson, L. F. Kebler, M. I. Wilbert.

Northern Ohio Branch, American Pharmaceutical Association—W. C. Alpers, W. T. Hankey, A. L. Flandermeier.

WOMEN'S ASSOCIATIONS.

Women's Pharmaceutical Association of the Pacific Coast—Miss Clarissa M. Roehr, Dr. Josephine E. Barbat-Winslow, Mrs. K. K. Voluntine.

Women's Organization National Association Retail Druggists—Mrs. J. W. England, Mrs. E. H. LaPierre, Mrs. Chas. Mann.

The following Delegates have credentials from two or more Organizations and according to By-Laws of the House of Delegates, should choose whom they will represent :

L. E. Sayre, C. L. Diehl, H. P. Hynson, F. J. Wulling, E. G. Newcomb, Ch. Holzhauer, Chas. LaWall, Geo. T. Timmons, L. Flemer, Wm. Bodemann, E. Spease, H. C. Washburn, E. A. Ruddiman, J. M. Rozoff, M. I. Wilbert, C. A. Mayr, J. Hostman, F. P. Stroup, A. W. Pauley, J. L. Lascoff, Otto Raubenheimer, H. V. Army, W. C. Alpers, W. T. Hankey, L. C. Hopp, Dr. A. Schneider, J. G. Godding, E. H. LaPierre, Wm. C. Anderson.

Respectfully submitted,

Signed

(Signed) PHILIP ASHER.

F. E. STEWART.

F. W. NITARDY, Chairman.

Sixty-one answered as being present.

The Chair stated there still seemed to be some confusion about the recognition of delegates, and trusted that every member present would recognize the fact that the House of Delegates in itself, could not recognize a delegate unless his credentials had been approved by the Credentials Committee of the Council. Unless his credentials had been approved by the Council a delegate had no standing in the House of Delegates.

The Chair then, for the information of the Delegates who were not present at the first meeting, stated that he had named the following as the Committee on Resolutions:—William Mansfield, New York, Henry M. Faser, University, Miss., Cornelius Osseward, Seattle, Wash., Fred W. R. Perry, Detroit, Mich., Wm. B. Day, Chicago.

The Chair called for the reading of communications from the Association Sections and the Council. The Secretary informed him there were none.

The Chair then called for reports, resolutions and communications.

Mr. Jeannot Hostmann, of Hoboken, N. J., offered the following resolution:

"Be It Resolved, That it is the belief of the House of Delegates that the Year Book of the A. Ph. A. should contain abstracts of all papers submitted by members of the A. Ph. A. and published in the Journal."

He stated, as a reason for this resolution, that at the present time the papers submitted at the meetings are not abstracted and the only place to get them *in toto* was in the Journal.

Referred to Committee on Resolutions.

Professor W. S. Jackman, of Detroit, read a communication from the Maine Pharmaceutical Association, asking that the Association meet in Maine in 1917 and assist the Maine Association in celebrating their fiftieth anniversary.

Mr. Woodruff, of Detroit, stated that while he had no resolution to offer, with the unanimous consent of the delegates, he would like to give them a very important piece of information. He stated that in Arizona they are to vote next November upon a constitutional amendment which will absolutely prohibit the introduction of wines, spirits, liquors or alcohol in any form, denatured alcohol being excepted from the provisions of the amendment; that those who are campaigning in favor of this proposed constitutional amendment are claiming that denatured alcohol will answer all the requirements of pharmacy and that the Government has especially provided denatured alcohol for that purpose; that the inquiry came to him from Arizona as to whether that was true, and the last he knew about the law permitting the manufacture and use of denatured alcohol was that it absolutely prohibited it to be used for liquid medicinal preparations. He stated he did not know but what possibly some amendment had been made to the law that he had not heard of that would warrant the assertion of the campaigners in Arizona, and in order to find out, he called up the Revenue Office in Detroit and they advised him if there had been any such amendment they had not heard anything about it. Evidently the people in Arizona who are so anxious to amend their state law are either mistaken as to the Federal law or they are deliberately deceiving the people.

He stated further that if any delegates were present from Arizona this would undoubtedly be interesting information to them. In any event it is of academic interest to all the delegates because they ought to know that denatured alcohol cannot be used in liquid medicinal preparations.

Mr. Gordon then presented the following resolution:

"Resolved, That the President of the American Pharmaceutical Association at the opening session of each annual convention shall appoint an official censor whose duty it shall be to supervise the matter given to the representatives of the local press to insure that fair and accurate accounts of the proceedings and business of the Association during such meetings alone are printed."

Mr. Gordon stated he offered the resolution in view of the article that appeared in one of the Detroit papers that morning which would give the impression to the lay public that the President of the Association had recommended that the druggists have the mails thrown open to the free transmission of "dope" in medicines and drugs, the word "dope" being printed in big black type. That of course we understood perfectly well what the President's recommendation meant; that pharmacists should be allowed to receive packages, such things as heroin tablets from the wholesale druggists, but that the way the headlines were worded, it would seem that the American Pharmaceutical Association was trying to have

the mails thrown open to the free distribution and traffic in "dope," and therefore he thought an official censor should be appointed at each meeting to supervise as far as possible the matter given to the press and the way it is to be handled.

The Chair stated if there was no objection, the resolution would be referred to the Committee on Resolutions.

Prof. Otto Raubenheimer, of Brooklyn, said he did not quite understand what a censor could do; that such things must be done before the articles are printed. It was the duty of the Publicity Committee to furnish proper news and proper publicity to the papers, which was done at the Nashville meeting.

Mr. Gordon replied it would be the censor's duty to see that a fair and accurate account is printed. He would have that for his special duty and nothing else, and if he could not manage to get out a fair account, then he could be "fired" and another censor appointed.

Mr. Woodruff said that the resolution was practical enough so far as the text of the matter supplied to the press was concerned, but wanted to know how the censor could control the headlines; that the censor could give the press any account he pleased, but the newspapers would put any scare head over it they wanted to.

Mr. Gordon explained that the idea would be for the representatives of the press to come to the censor, and that his experience had been that newspaper reporters are very decent fellows, and if they knew that there was an official appointed to furnish the press with whatever information the Association desired, it would act in the nature of a check on irresponsibility. He did not claim that the scheme would absolutely prevent such things as had occurred that morning, but it would be a step toward preventing it, would not do any harm and might do some good.

Mr. Hynson stated that there is a press committee of the American Pharmaceutical Association which has this matter in charge, but that in this instance, unfortunately, it had slipped through that committee, and that the Chairman had told him a half hour ago that it had worried him very much and he had sought a correction in that afternoon's paper, and the correction would be found in the same paper. Mr. Hynson said he thought the members ought to know there was a press committee which was active, and that Mr. Harry Mason happened to be chairman that year, and that this was simply an unfortunate slip.

The Resolution was referred to Committee on Resolutions.

Mr. William Gray, of Chicago, stated that he would like to call upon Prof. Remington to say something about the Pharmacopœia.

The Chair stated he was sure that every member present would be interested in anything that Prof. Remington had to tell them about the Pharmacopœia.

Prof. Remington then said that there was to be a meeting of the Section on Pharmacopœias and Formularies the following morning when the Pharmacopœia would be discussed; that he would say now briefly that the Pharmacopœia was now in press; that they had started to print the book and that there had been sent to the printer about 200 pages of the back part, covering volumetric solutions and the tables and the part of the Pharmacopœia which will be used in correcting the text of the book; that naturally, the standard tables were in the back

part of the book; that they must be corrected and amended and gotten exactly right. Each member of the committee would get a copy of these tables and they would be used when they started in with the text; and they would start in on the text immediately after this part of the work is through. He might say incidentally that the British Pharmacopœia was finished and that he fully expected to have a copy of it to show to the members at this meeting; but word come from the editor that the book would not be issued at all. As a result of the war they had held up the publication and the printing of the Pharmacopœia. Prof. Remington said he mentioned this as a matter of interest to the members because possibly some of them did not begin to realize what this war is going to mean to the future. He did not know the specific reasons for withdrawing the work or postponing publication. There were still a number of questions to be settled and the Committee on Revision was to have a meeting before the adjournment to go over the situation. Outside of a few things there seemed now to be nothing, after the tables are printed, in the way of going right ahead with the book. It would probably take four months to read the proof sheets, and it might take longer in case any questions came up, so he could not at that time set the date of the publication of the Pharmacopœia, but unless the United States became involved in war, the United States Pharmacopœia would appear before the British Pharmacopœia.

Mr. Hynson, under the question of unfinished business brought up the amendment he offered to the by-laws at the first session, stating that he was quite anxious for the House of Delegates to seriously consider this matter, as he believed the life of the House of Delegates was somewhat dependent upon a readjustment of the delegations, and if he was not mistaken, this idea of making it a body of equal delegates representing the splendid state associations would be a successful solution of the trouble. He thought it should appeal to the delegates as an opportunity for the organization and correlating of the state associations of this country under the auspices of the American Pharmaceutical Association, and it seemed to him so patent a thing as to hardly need any argument.

Mr. Hynson moved that this amendment be adopted by the Association. If the amendment were voted down, he would feel that his responsibility had been relieved and he had gotten the matter out of his system and the delegates had taken the responsibility and the House of Delegates into their hands.

Mr. Weinstein, of New York, wanted to be informed whether the proposed amendment would bar colleges from sending delegates to the American Pharmaceutical Association, as they had been doing in former years. In other words, whether Doctor Hynson means to separate the House of Delegates for executive work, for resolutions, etc., from the general sessions of the Association and whether the proposed amendment meant the delegates could not be received in the House of Delegates but on the floor of the general meeting.

The Chairman said that this certainly would not prevent the sending of delegates.

Mr. Hynson in reply to Mr. Weinstein, said if an association were of sufficient importance to claim representation, they should be received. Delegates by courtesy are sent to this association from, for instance, the American Medical Association and the American Chemical Association, and that those national asso-

ciations were of sufficient importance to be received in open session at the opening meeting, as had been heretofore done, but it was not to be supposed after the passage of this resolution, if it was passed, and the House of Delegates reorganized along this line,—that they would ask for and receive delegates from local associations or from colleges or from other organizations as had been the practice. The reason that those delegates came in the past was because they had no national representation in a regular national association, but that this was no longer true and they had such representation so that there was no need for a college of pharmacy for illustration, sending a delegation to the House of Delegates as they had representation in their own national organization which was affiliated with the American Pharmaceutical Association.

Mr. Weinstein said that it was not clear to his mind yet; what he wanted to know was whether delegations from the bodies he mentioned could be sent to the American Pharmaceutical Association and not to the House of Delegates. If the intention was to make the House of Delegates a true representative institution of the states, and each state send three delegates for the purpose of passing upon resolutions and doing executive work, he heartily supported the amendment; if it meant that it would bar delegates from the retail drug associations, the colleges of pharmacy or an organized association of any other order, who now have the right to come here as delegates to the main body of the Association and who are granted the privilege of the floor and accepted as delegates, then he opposed the amendment.

Mr. Hynson replied that he could not see how the proposed by-law could prevent these people from coming to the Association as delegates, but he hoped it would bar delegates from any association other than a national body, and there was no reason why the American Pharmaceutical Association should at this time receive delegates from every college and every local association; and he believed that the affairs of the Association would get along very much better if the small local associations would send representatives to the American Pharmaceutical Association through their national association in which they are already represented.

Mr. Raubenheimer said the idea of Professor Hynson, in his mind, was an excellent one, and he would certainly be in favor of it.

To inform Mr. Weinstein, Mr. Raubenheimer stated that the delegates from the smaller associations do not bring greetings as the National Associations do to the A. Ph. A. He referred to the delegate from the American Medical Association, and to Mr. Bodemann of the National Association of Retail Druggists who brought the greetings of these associations to the A. Ph. A. The adoption of this amendment would disbar small associations of retail druggists from sending delegates to the A. Ph. A. or the House of Delegates. He said if the smaller associations had any question they wished to bring before the A. Ph. A., they could appeal to the state association and ask the state association to bring such matters before the A. Ph. A.

Mr. Frank H. Freericks, of Cincinnati, Ohio, stated that he did not wish to appear as opposing anything that his friend Doctor Hynson proposed, but it occurred to him that the real sense of the amendment was that the House of Delegates as constituted at the present time is really not representative. In

other words, that it is not big enough because it is made up of the various representatives of the various smaller organizations. It seemed to him they were getting just a little away from the original purpose which caused the founding of the House of Delegates. If he remembered correctly, the primary purpose in founding the House of Delegates was to give the men who represented the smaller associations, and who were unacquainted, an opportunity to get in somewhere, and to know that they represented something and that the others who were there were there because they represented something. The House of Delegates originally, if he understood correctly, was organized primarily as a sort of clearing-house and to do away with a great many things that interfered with the general work of the association and give everybody an opportunity to be heard more or less. He agreed that up to this time the original plan had not worked out properly and that there was something missing. There was not the proper spirit about it. There might be a reason for it which they might be able to remedy, but he was not prepared to say that Professor Hynson's proposition of limiting the representation exclusively to delegates from State Associations was not a good one. He recalled in the early days when he attended the A. Ph. A. convention when he didn't know anybody, and when he came as a representative from a small local association, it would have made him feel much better if he had known that he had a place in the Association somewhere, and it was that very thought that caused the formation of the House of Delegates.

He did not want to appear as opposing the proposition as submitted by Dr. Hynson, for everyone would agree that there was something lacking in the matter of the conduct of the House of Delegates and of preparing its work. If it was to have any work to do, it should be work that would be of service. He recalled that the House was rather hurriedly organized and brought into life at Denver; that there were some who were instrumental in its organization who had given it much thought, but possibly not developed thought, and who may not have been called upon to add to what they originally proposed and to further work it out. It occurred to him that a better purpose might be served if a committee were appointed to thoroughly study the activities of the House of Delegates and the work that might be turned over to it, rather than to undo the original idea, and doing away altogether with representatives from the smaller associations in the body. It seemed to him it would be worth while to give it study, and in that connection he did not think the proper effort had been made in the way of giving notice to the various local associations to prepare resolutions and present them. He did not think that anything along that line had been done particularly, or if it had been done, it had been done after the various associations had held their meetings so they could not prepare resolutions. He thought those were the things that should be worked out so that instead of having a purposeless meeting of the House of Delegates, something might be done that would be really worth while and done without changing the manner in which the House of Delegates is at present made up.

Mr. Hynson asked Mr. Freericks what he would think if the House of Representatives at Washington were composed of members from the state; or the congressional districts, and also from the counties.

Mr. Freericks replied that he fully agreed with Mr. Hynson's argument if the

House of Delegates were really to be the all-important body of the Association, but he was not willing to grant that it was to be the all-important body of the Association; he believed that the general sessions of the Association should continue to be the all-important sessions of the meetings.

While he heartily agreed with the contention that it seemed idle to bring delegates together from the larger associations, the national associations and state associations and the smaller associations, still it was not originally the intent of forming the House of Delegates to constitute or be constituted of representatives simply from the important organizations. The purpose of creating the House of Delegates was to make it a sort of clearing-house for things that could not be otherwise handled. He realized that it was not serving a good purpose at the present time because it was doing no work, but he did believe that if a committee were appointed to study out proper functions for the House of Delegates, it could do good work and it would really serve the purpose for which it was originally intended.

Mr. Gordon said that the by-laws creating the House of Delegates provide places for the delegates from the small colleges and small associations who come in and find they have no other place in the workings of the association. The House of Delegates was originally thought out by Professor Beal to provide a place for all of these delegates in the association and to give them some work to do, with the hope that when a college or state association had some matter that it wanted to bring before the parent association, it could be brought up by their delegate and discussed in the House of Delegates and prepared as a resolution, and the resolution either approved or disapproved by the House of Delegates and the final recommendation presented to the Council.

He said the idea was to provide the House of Delegates for those who came to the meetings alone and unacquainted, and give them a human interest in the work of the Association. He agreed with the other speakers that the House of Delegates had not done well, but it was not the fault of anybody but the House of Delegates itself, and he would second the motion, if he were a delegate, that a committee be appointed to outline a comprehensive plan to make the House of Delegates an active working body of the American Pharmaceutical Association to work as a clearing house for all the colleges of pharmacy and state associations. So long as they were interested enough in the American Pharmaceutical Association to send delegates to its meetings, it was no more than fair that the Association should return the courtesy by giving them something to do in the meeting.

Mr. Freericks said that if a committee were appointed along the line suggested, it could work out something that would serve a splendid purpose, and they could still continue the House of Delegates as a sort of a clearing-house, which would give an opportunity for the smaller organizations to take part in the activities of the Association. He was thoroughly convinced the House of Delegates could be used for the purpose of giving new men, gradually, an opportunity of working-in, and of feeling free to stand up on the floor and speak their minds. He was certain if the various bodies who were now represented had known they could offer resolutions, that they would have prepared and presented them. If they had that opportunity many of them would accept it, and it would add to the Association spirit.

Mr. Edw. N. Webb, of Columbus, O., stated that he had never before attended a meeting of the Association, but he had been a member for nine years of the A. Ph. A., and a member of the American Chemical Society for ten years, and that if he were permitted to take a moment of their time he would point out something that had occurred to him. It seemed to Mr. Webb that the question before the House of Delegates properly resolved itself to this: Is the American Pharmaceutical Association to be a name, or is it to embrace the business and profession of pharmacy in this country?

Mr. Webb thought that few of the firms such as his,—The Columbus Pharmacal Co.,—would trouble to attend a meeting of the state association to present a petition or resolution to be brought before the American Pharmaceutical Association; that they did not have to; their business was established and growing, and growing without the necessity of presenting resolutions; that if the Association wished to keep them interested there was only one way, and that was through the House of Delegates, because the general sessions of the A. Ph. A. would not bring them to the convention.

He said the objection which had been made to the drug clerks being represented in the House of Delegates did not appeal to him. While he did not represent the drug clerks, he ventured the assertion that as most of the proprietors came from the ranks of the drug clerks, if the Association was going to keep the clerks out they would keep out the proprietors of the future, and thus limit the representation of the profession as a whole.

Mr. Woodruff stated his understanding of the purpose of the House of Delegates was that it was simply to be a sort of an advisory body where a consensus of opinion of the various branches of pharmacy might be obtained upon questions which were of interest to all the branches of pharmacy in common, and therefore be a sort of clearing-house, as the term had been frequently used, for resolutions originally introduced into the meetings of the associations of general, rather than of special interest, for illustration, matters of legislation in which not only colleges of pharmacy are interested academically, but the retail and wholesale druggists were interested practically, and in which the manufacturers were also interested. Resolutions that related to matters of that kind were to be referred, as he understood it, to the House of Delegates, in order to give all interested an opportunity to be heard, after which the House of Delegates would simply make its recommendations to the Council, and Council could do as it saw fit. He understood that the House of Delegates would simply be a sort of advisory board, rather than a body that could control the affairs of the Association.

Mr. C. G. Merrell, of Cincinnati, said that there was undoubtedly a great deal of truth in what Doctor Hynson had said in presenting his resolution. The representation in the House of Delegates was rather unusual in an organization of this kind. It was heterogeneous, and it did not represent the membership of the American Pharmaceutical Association, as the membership in other bodies was represented. However, Dr. Hynson's remedy did not seem to him to be a good one in view of the fact that the state associations are not constituent bodies of the American Pharmaceutical Association, but were independent bodies and a large portion of their members were not members of the A. Ph. A. It was a question in connection with the general questions brought up in the President's address

and the Secretary's report, which ought to be considered together. It was a question that could not, possibly, be considered at the present meeting, and he believed the suggestion of Mr. Freericks that a committee be appointed was the only solution of the matter, and if it was in order for the body to do so, he would like to second the motion of Mr. Freericks that a committee be appointed to make a study of the matter and to report at the next meeting. It seemed to him it was worth whiel to take this step, and something good might come out of it. It was evident something was needed, but it was also evident that they had not yet hit upon the proper remedy.

Mr. Joseph L. Lemberger, of Lebanon, Pa., stated that he had been listening to all that had taken place at the meeting. It was the first time he had been in the House of Delegates as he had not attended the last two meetings. He did not believe there was a single body that had sent delegates which was not perfectly justified in sending them. He looked upon the body as a representative body of all the branches allied with the American Pharmaceutical Association. He did not believe there was any delegate there who had not a full understanding of his privilege as a delegate to the body. He came principally to represent the Pennsylvania Pharmaceutical Association, and he believed that all these associations, such as the National Wholesale Druggists' Association, the National Association of Retail Druggists, had active members in the American Pharmaceutical Association, and he believed they made it a point to send delegates to the A. Ph. A. to represent them. He would like to see the House of Delegates get right down to business. They were in a sort of a formative period and he did not believe in smashing the egg they were hatching, until they knew it was not sound, but to give it a chance. He said that if there were any weaknesses he felt sure they would develop, and with the aid of the parent association, the difficulties would be corrected. He had an idea what led up to the formation of the House of Delegates, and he believed the matter was wisely considered. The plan seemed to be working well in the American Medical Association, which he believed was the pattern after which this body had been organized, and he did not believe that it had had the opportunity of showing what it could do because it was, so to speak, in its formative period, and he would like to see the original plan of the House of Delegates carried out. He wanted to impress one fact upon the delegates and that was that any delegates who had been sent there, and whose credentials had been approved, should have the courtesy of the floor for suggestions, and it was up to the House of Delegates itself to consider the suggestions presented. He advised proceeding with caution. He had heard intimations that the House of Delegates did not amount to anything, but he did not believe it. He thought it did and that the best thing to do was to get in good working-shape.

Dr. W. C. Anderson, of Brooklyn, N. Y., stated he hoped that Mr. Freericks' motion with reference to the appointing of a committee to make a study of the matter and determine what the work of the House of Delegates is, should be carried. He felt that the condition present was due to a misunderstanding. The House of Delegates, in reality, was intended to be a Committee on Resolutions; in other words, the resolutions brought before the meeting of the American Pharmaceutical Association should be referred to the House of Delegates and considered by that body. A sub-committee, if you please, should formulate the action

of the body into a definite list of resolutions, so that at the last general session of the American Pharmaceutical Association there would be presented to that body a complete list of resolutions outlining the policies of the organization that could be acted upon at that meeting. The plan suggested had been carried out in some organizations with a great deal of success and in order to make it absolutely successful in this organization, practically all the recommendations and resolutions that are offered at the sessions should be referred to this body, and this body act as a committee on resolutions, allowing free discussion, and then its action recorded, and its approval or disapproval sent to the parent body for its final action. He believed the idea of having these resolutions after they passed go into the Council for its approval or disapproval and then come back into the general session, makes the procedure cumbersome and wastes a lot of valuable time, which he thought was unnecessary. If the original plan were carried out, reports of officers, for instance, would be referred to the House of Delegates, together with the recommendations or reports that come up in the different sessions. It would act as a clearing house for these things. The idea of admitting other than members of the organization to seats in the body, was with the idea that members of the A. Ph. A. would constitute the body principally, and the representatives of organizations that had not membership in the A. Ph. A., would have an opportunity to say something on propositions which they themselves might bring into the organization and would have the privilege of offering resolutions, because they would have no other way of bringing resolutions or the opinions of their organization on certain subjects to the American Pharmaceutical Association. He believed if the House of Delegates were constituted in that way and the officers and sections of the American Pharmaceutical Association understood what this body was to do, it would facilitate the work of the organization very much.

Dr. Anderson said, in this connection, he might refer to the National Association of Retail Druggists which works on this plan. In that body all resolutions are referred to the Committee on Resolutions. This committee holds meetings at which a free discussion of the resolutions takes place and that then a report upon the resolutions was made to the Association for discussion and action. This procedure facilitated the work of that Association in a large degree. In fact he might say that it would be impossible to conduct that organization along proper lines and get through with the work, if that method was not followed. He trusted that there would be no movement that night without deliberate consideration, to radically change the body, and was very much surprised that any member of the A. Ph. A. having its interest at heart should come into a new organization and introduce anything that would tend to disrupt it. If any members of the Association could not understand just what the body could do, they at least should give sufficient time for a study of it. They ought to study it because there were members who saw things very quickly and it took others a longer time to understand them, particularly anything that they originally have been opposed to, and therefore, he believed that they should give deliberate consideration to this matter and have this committee report at a later session, possibly, of this meeting, just what, in their opinion, the province of this body is and see if a way could not be provided for the representatives of these other organizations to meet with the A. Ph. A. and join in the discussions and help in the work of the Association.

Mr. Bodemann stated that the reason the Resolutions Committee referred to, worked so successfully and so skillfully, is, that there are not three, or four, or five cog wheels in it. All the resolutions are referred to the Resolutions Committee and that committee has no sub-committee in its own body. The House of Delegates has to report to the Council and they can either disapprove matters sent to it by this House or report them to the Association. In the N. A. R. D., resolutions are referred to the committee and the committee has an open session, and they report their action back to the general session, and it is settled right then and there. But in this association it goes through three or four cog-wheels and the members do not know whether it is acted upon or not, and sometimes they never hear of the resolutions again.

The Chair stated that there was no special motion before the meeting; that Prof. Hynson had offered an amendment in writing but it had not received a second.

Mr. Hynson replied that he thought it had been seconded and he understood the amendment had been referred to the Committee on Resolutions at the first meeting.

The Chair stated that it had not been, and for the information of the delegates present called their attention to Chapter 7, Article 2, amendments, providing that every proposal to amend the by-laws shall be submitted in writing at one session of the House and may be voted upon at the next session and only upon receiving the affirmative vote of three-fourths of the members present it shall become a part of the by-laws, and asked if the members were ready for the ballot.

Mr. Frank Ryan, of Detroit, stated he was not a delegate but in observing the proceedings it seemed to him he had discovered the reason that there is no business before the body, and if they would permit him, he would like to say that it is apparent that the associations sending these delegates have really placed nothing in their hands to bring before the House of Delegates. If they wanted to keep that body alive they would have to take steps to have the various associations understand that their delegates are the proper people to bring resolutions before the body, and anything the various associations wanted to bring before the American Pharmaceutical Association should come through their delegates to this delegate body. Unless they told these associations of the purpose of the House of Delegates they would never get any resolutions, and it seemed to him the trouble was, the fact that the delegates have not any resolutions to bring; that in order to keep the House of Delegates alive they had to do something in the way of informing these associations what the House of Delegates was for.

Chairman Snow replied that for his information and that of the delegates present, he had written the president of every state association between the first of January and the first of March, informing him of the meeting of the Association and asking to have each state association represented by three delegates, and especially asking them that they send with the delegates resolutions in which the state associations were interested.

Mr. Ryan replied that that was very commendable but it was necessary to do more than that, that the Chairman would have to pound it in with a hammer.

Mr. Merrell inquired if he had confined his notices to the state associations, and the Chair replied that he had, because of a lack of time.

Mr. Merrell said that was just the point he tried to make, that the members of the state associations are not all members of the A. Ph. A. and that perhaps they were not directly interested in the work of the House of Delegates as perhaps some of the colleges or branches or other organizations of that kind.

Mr. Hynson said he recognized the difficulty of reaching a decision that evening. The question was one requiring much study and thought. At the meeting at Hot Springs in 1908 he had proposed the formation of a House of Delegates, to consist of representatives from State Associations and the idea was ridiculed. Since that time he had given the matter deliberate consideration and he was still of the opinion that the logical way of organizing the House of Delegates was in that manner. He believed that the House of Delegates was a splendid thing for the Association, but that its faults of organization should be corrected. The American Medical Association has a House of Delegates composed of delegates from state-bodies and from nothing else, and that was what he was trying to accomplish for this body. By such an organization of this House the State Associations would be brought into close and intimate touch with the Association and more interest would be taken in its work and a greater dignity given to its deliberations. He believed that the proposed plan was so based upon order, precedent and good example and also was so founded upon common sense that it must be adopted in time. He therefore moved to table his amendment and to move that a Committee of five be appointed to consider the organization of the House of Delegates and its interests in connection with the parent association and that the amendment which he had proposed should be referred to this committee when appointed.

Mr. Freericks seconded the motion and said that the committee should have a year's time to consider the matter and to give it thoro study. It was true beyond question that the organization was not working well,—as we would like to see it work and he believed that the proposed committee would be able to devise some plan by which it could be made most useful to the Association.

On motion of Mr. Bodemann the House adjourned to meet on Friday evening.

THIRD SESSION.

The Third Session of the House of Delegates was called to order, August 28th, at 8:00 p. m., in room "C" of the Convention Hall, of the Hotel Pontchartrain.

The meeting was called to order by Chairman Snow, to listen to the report of the Committee on Resolutions, and the election of officers. The Chairman announced, that if there was no objection, the body would take action on the resolutions *seriatim*, as read by the Chairman of the Committee on Resolutions.

The Chairman of the Resolutions Committee, Mr. Mansfield, then read the first resolution, as follows:

"*Resolution No. 1.* It was moved by W. Bodemann, seconded by Mr. H. M. Whelpley, that the House of Delegates endorse the aims and purposes of the Chicago Veteran Druggists Association,' etc.

Mr. Mansfield said that the above resolution had been approved by the Resolutions Committee, and the Committee recommended that the Resolution be adopted by the House of Delegates.

Chairman Snow explained to Mr. Mansfield that the House of Delegates existed by virtue of the action of the Council, and it had to report to the Council, that if the Committee on Resolutions saw fit not to concur in some of the resolutions that were submitted to them, that action could be disapproved by the Council.

Secretary Kuever said he was under the impression that any resolution the Committee would approve would not go to the Council at all, and was advised by Chairman Snow that they reported to the Council with their approval or disapproval, and if the Council did not see fit to accept the action of the Committee on Resolutions, they did not do so.

Mr. Mansfield then proceeded to read Resolution No. 2, as follows:

2. *Resolved*, That the American Pharmaceutical Association instruct its representatives in the National Drug Conference to act immediately in connection with the representatives of the allied branches of the drug trade in the Drug Conference to draft at the earliest possible moment a bill to reform the present patent law, registration of names of drugs and the granting of sole right to sell certain drugs to the people of the United States suitable to the best interests of the drug trade in the United States, and to urge its passage at the earliest possible opportunity, and the support of the A. Ph. A. is hereby pledged to such reform.

Mr. Frederick T. Gordon, of Philadelphia, stated that the whole system of patent laws needed reformation, as everybody would concede, and that now was the time to get it, because the Congressmen themselves felt the need of it at this time, and there never had been a better time to push the matter; that the N. A. R. D. has passed a similar resolution, and the other associations represented in the Drug Trade Conference would probably pass it, and he thought if the representatives of the different associations in the Drug Trade were properly instructed, something would be done.

Chairman Snow stated that if there was no objection the House of Delegates adopted the report of the Committee, on this resolution. There being no objection, the report was adopted.

Mr. Mansfield then proceeded to read the third resolution as follows:

3. That the A. Ph. A. make all possible effort to have only graduates of recognized schools of pharmacy nominated as members of the State Boards of Pharmacy by the State Associations and where possible have such amendments made to state laws as will make such qualifications a pre-requisite.

Mr. Mansfield in explanation of the action of the Committee on the third resolution stated that the Committee had thought that the resolution would do no harm, but that they did not think it would do very much good because they did not know how it could be enforced.

Chairman Snow stated that it put the Association on record as favoring such a proposition. Mr. Mansfield said that was the idea the Committee had in mind, and that was the reason they recommended its adoption.

The resolution was adopted.

Mr. Mansfield next proceeded to read Resolution No. 4 as follows:

4. *Resolved*, That the incoming President be and is hereby instructed to appoint a committee of three members, which committee shall confer with similar committees, appointed for the same purpose by other organizations, upon the advisability of forming a congress of national drug and pharmaceutical bodies

under the auspices of the American Pharmaceutical Association. And be it further

Resolved, That the results of the conference of these committees shall be reported to the several organizations represented and to the American Pharmaceutical Association at their annual meetings in nineteen hundred and fifteen, with such recommendations as may be agreed upon.

Mr. Mansfield explained in regard to the above resolution that here again the Committee felt that it was a move in the right direction; that the proposed congress would be a congress of the national pharmaceutical bodies of the country which would be able to do a great deal of good.

There being no objection the House of Delegates adopted the report of the Committee on Resolution No. 4.

Mr. Mansfield then read Resolution No. 5, as follows:

5. WHEREAS, The usefulness of the House of Delegates during its two years' existence, not having been such as was expected at the time of its installation, it is important that something be done to increase this usefulness; therefore, be it

Resolved, That it is the sense of this House of Delegates that increased efficiency can be secured by making this body a permanent one instead of making its existence dependent upon the actions of the Council.

The Committee recommended its adoption.

Chairman Snow stated that the resolution above seemed to be in accord with the sense of the delegates and if there was no objection the report of the Committee would be adopted.

Mr. Hostmann said that his idea in bringing this up was because he had heard that the Council had appointed a committee to consider the question of the usefulness of the House of Delegates, and he knew that there had been a committee appointed by the House of Delegates, but he thought it would not do any harm to impress upon the Council that some of the delegates thought there was some usefulness in the House of Delegates.

Mr. Gordon said that the House of Delegates was not dependent upon the Council for its existence; that it had been created by a vote of the Association, at Denver, and it would take a vote of the Association to abolish it.

Chairman Snow replied that he thought Mr Gordon was correct.

Mr. Gordon continued there had been considerable debate upon the House of Delegates proposition at the first session of the Denver convention, and it was such a serious innovation that he made the motion himself that the whole thing be printed and distributed to the members so that the matter could be gone over in private, and discussed among the members, and have the matter taken up at a later session; that the proposed constitution and by-laws were, in accordance with that motion, printed and distributed among the members, and the matter was discussed during the week and at the last session the matter was taken up and adopted, and the vote was almost unanimous to establish the House of Delegates, and the Council had nothing to do with it.

Chairman Snow stated that he did not know but what Mr. Gordon was correct, but that he had a personal letter from Dr. Beal, in which he made the statement that the House of Delegates existed by action of the Council, and he felt that action should be taken to make it a permanent section.

Mr. Hostmann said that he believed Mr. Gordon was right, but he thought the

resolution referred to would not do any harm, and would call attention to the fact that there was a lot of misunderstanding about it.

Mr. Gordon said he thought the suggestion was all right, and he only wanted to bring out his point.

There being no objection the report of the Committee on the above resolution was adopted.

Chairman Mansfield then read Resolution No. 6, as follows:

6. That it is the belief of the House of Delegates that the Year Book should contain abstracts of papers submitted by the members of the American Pharmaceutical Association and published in the Journal of the American Pharmaceutical Association.

Mr. Mansfield said in regard to the above resolution that many of the most valuable papers that are published during the year are papers that are read before the different sections of the Association, which are never abstracted and never appear in any of the proceedings, and he thought every one felt that a presented paper certainly ought to be abstracted and placed in the Year Book, and for that reason recommended the adoption of the resolution.

The report of the Committee was adopted.

Chairman Mansfield then read resolution No. 7, as follows:

7. That the President of the American Pharmaceutical Association, at the opening session of each annual convention, shall appoint an official censor whose duty it shall be to supervise matter given to representatives of the local press, and to insure that fair and accurate accounts of the proceedings and business of the Association during such meetings shall be fairly and accurately printed.

In regard to the above resolution, Mr. Mansfield said that the Committee felt that it was a resolution which they would favor because it would not do any harm, although they did not feel it would do much good.

Report of the Committee on the above resolution adopted.

Chairman Snow stated that he had a resolution from the Section on Education and Legislation, which seemed to have been taken up by that section Thursday, and which had been referred to the House of Delegates, and if there was no objection, the House of Delegates would take action upon it. He read the following Resolution:

8. That the principle in the two measures—the Metz Bill and the Stevens Bill, i. e., price standardization, be approved by this Association.

Mr. W. S. Richardson, of Washington, D. C., moved that the Resolution be approved. Motion seconded by Mr. Mansfield and carried.

Chairman Snow stated that he believed the consideration of resolutions was completed, and that a motion had been made and carried that the Chairman appoint a committee to investigate the House of Delegates, and see if its usefulness could not be improved. Chairman Snow appointed the following, as members of the Committee:

H. P. Hynson, of Baltimore, Md., F. H. Freericks, of Cincinnati, O., Joseph Lemberger, of Lebanon, Pa., W. C. Anderson, of Brooklyn, N. Y., F. M. Apple, of Philadelphia, Pa.

Chairman Snow stated that the motion which had been passed contained the suggestion that the above Committee make their report at the next year's meeting.

The next order of business before the House of Delegates was the election of officers.

Mr. Hostmann inquired whether they should proceed with this matter, in view of the fact that they might elect somebody as an officer who would not be a delegate to the next annual meeting. Chairman Snow replied that they should, and stated that the procedure had been changed at the Nashville meeting for the reason that when they elect officers at the beginning of the meeting for that meeting, they might find it necessary to elect some delegates as officers who had no idea of their duties, or of the business to be done by the House of Delegates.

Mr. Gordon inquired as the House of Delegates is not a self-perpetuating body, how they could elect officers for the next meeting; how it could be known that the officers would be delegates to the next meeting.

Chairman Snow replied that they were delegates at present and were delegates until a successor was chosen, and the idea was, as he had just explained to Mr. Hostmann, to avoid electing a delegate an officer who would have no chance to look over the situation and inform himself on what duties he should perform.

Mr. Gordon said that if a delegate wanted to come back to the next meeting, he would have no trouble in being appointed a delegate.

Chairman Snow stated the next order of business would be the election of officers for the House of Delegates for the ensuing year, and explained that the constitution and by-laws provided for the election of a chairman, two vice-presidents and a secretary, and that nominations were in order for the office of Chairman for the House of Delegates.

Chairman Snow further stated there was a provision in the constitution and by-laws for as many sessions as were required to transact the business of the House of Delegates, but that under ordinary conditions the session at which the Resolutions Committee reported was the final session. After making this explanation, Chairman Snow stated that nominations for Chairman for the ensuing year were in order.

Mr. Mansfield said it seemed to him in view of the several resolutions which had been adopted by the House about the effectiveness of the organization, and in view of the fact that its reorganization required special knowledge of the workings of the society, that the present president of the House of Delegates should be re-elected to the position in order that he could go on with the work and bring about the results he thought best.

Mr. Mansfield stated that was the way it appealed to him and for that reason took great pleasure in placing the name of Mr. Snow in re-nomination for president.

Seconded by Mr. Hostmann.

Chairman Snow stated with all due regard to Dr. Mansfield it did not seem possible that he would be able to go to California and he thought he had already received sufficient honor in having served one year, and for this reason would have to decline. He stated he appreciated very much Dr. Mansfield's action but he could not consider serving another year.

Prof. Remington asked the Chair for a little information. He stated some one had told him,—he could not remember who,—that the House of Delegates had not elected any officers, and if it was true, he only wanted to say he thought it

was a very grave mistake to omit such an important matter; that he did not think the election of officers should be omitted as the Council and the Committee had not yet voted to give up the House of Delegates and he had great hopes that this "child" would acquire a lusty growth in the future, and until the action of the Association should be taken there was nothing else to do but for the House of Delegates to elect its officers just as though it were going to continue, and pay no attention whatever to these uncertain plans until the Association otherwise directed.

Mr. Faser nominated for Chairman Mr. W. S. Richardson, of Washington, D. C. This motion was seconded by Dr. Mansfield.

Mr. Remington then moved that the nominations be closed and the Secretary instructed to cast the ballot of the house for W. S. Richardson for Chairman; motion seconded and unanimously carried.

Mr. Frank H. Carter, of Indianapolis, Ind., nominated Mr. C. B. Jordan, of Lafayette, Ind., as First Vice Chairman; motion seconded.

It was then moved by Mr. Hostmann, seconded and unanimously carried that the nominations be closed and the Secretary instructed to cast the ballot of the house for C. B. Jordan for First Vice-Chairman.

Prof. Remington nominated Mr. H. M. Faser, of University, Miss., for Second Vice-Chairman; motion seconded.

It was then moved, duly seconded and unanimously carried that the nominations be closed and the Secretary instructed to cast the ballot of the House for H. M. Faser, of University, Miss., for Second Vice-Chairman.

Mr. Faser then moved that the present efficient secretary, Mr. Rudolph A. Kuever, of Iowa City, Ia., be re-elected.

Mr. Kuever thanked the House very much but said it would be impossible for him to serve because he had been elected to another position which would take a great deal of his time.

Prof. Remington nominated Mr. Joseph Weinstein as Secretary; motion seconded by Dr. Mansfield, who said that he was very glad to be able to second this nomination as he believed Dr. Weinstein would make a very efficient secretary for the organization.

On motion duly made, nominations for the office of secretary were closed and the Secretary directed to cast the ballot of the organization for Mr. Weinstein.

Chairman Snow then appointed Mr. Joseph Lemberger a committee of one to conduct the officers to the platform for installation.

Mr. Lemberger then conducted Mr. Richardson to the rostrum and presented Mr. Richardson as the newly elected president of the House of Delegates, stating he felt sure there had been no mistake made in electing Mr. Richardson, and that he would make good.

Chairman Snow then advised Mr. Richardson that he had been duly elected Chairman of the House of Delegates and he was now installed in his office.

Upon calls being made for a speech, Chairman Richardson stated that the House of Delegates would have to excuse him from making a speech, although he wanted to thank them for the high honor conferred upon him and he prophesied that the House of Delegates was going to be a very important body of the Association.

(Applause.)

Mr. Lemberger then introduced to the Chairman and the body, Mr. C. B. Jordan, the newly elected first vice-chairman, and said he felt sure that in this case they had made no mistake. Mr. Jordan, upon being declared the duly elected first vice-chairman, said he thanked the delegates very much for the honor and that he would try to perform the duties that might devolve upon him to the best of his ability.

Mr. Lemberger then escorted Mr. Faser to the front and introduced him to the new chairman, stating that Mr. Faser had been elected second vice-chairman and he believed the House had made no mistake in the selection of Mr. Faser, and that the time might come when the duties of the office of chairman would rest on his shoulders, although he was second vice-chairman; that those things had happened before, and that if it happened during Mr. Faser's administration he felt sure Mr. Faser would be able to handle the body.

Chairman Richardson declared Mr. Faser the duly elected and installed second vice-chairman of the House of Delegates.

Mr. Faser stated he had been looking for a long time for an office with no work attached and he believed he had found it, in view of the fact that there were two men ahead of him. (Laughter.)

Mr. Lemberger then introduced to the Chairman the newly-elected Secretary, Mr. Weinstein, and stated he felt Mr. Weinstein would discharge the duties of his office with fidelity; that the office was a responsible one and the organization had confidence in the new secretary.

Chairman Richardson declared Mr. Weinstein the official secretary of the House of Delegates. Mr. Weinstein said his election had been a great surprise to him and he appreciated very highly the honor conferred upon him. There was one consolation, namely, he did not know what functions the Secretary would have to perform and if he did not perform them properly it would be because of his ignorance of what he was supposed to do.

Mr. Snow said he would soon find out what his duties were.

Mr. Hostmann thereupon moved that the House of Delegates adjourn.

Motion adopted.

ESTIMATION OF CREATIN IN URINE.

A quantity of the urine containing between 7 and 10 Mgm. of total creatinin is placed in a small flask or beaker, and 10 to 20 mls of normal hydrochloric acid added together with a pinch or two of powdered or granulated lead. The mixture is boiled over a free flame until nearly down to dryness, and then evaporation is continued on a water-bath, until most of the excess of hydrochloric acid gas has been expelled. The residue is dissolved in about 10 mls of hot water, and the solution passed through a plug of cottonwool into a 500-mil volumetric flask. Twenty to 25 mls of saturated picric acid solution is added, and about 7 to 8 mls of 10 percent sodium hydroxide solution, which contains 5 percent of Rochelle salt. The flask is filled up to the mark at the end of five minutes, and read in the usual way. —S. R. Benedict (Journ. Biol. Chem., Baltimore, July, 1914.)

Reports and Papers of General Sessions

THE WORK OF THE BUREAU OF STANDARDS AND ITS RELATION TO THE AMERICAN PHARMACEUTICAL ASSOCIATION.

DR. FRANK A. WOLFF, ASSOCIATE PHYSICIST, BUREAU OF STANDARDS.

For the first time, I believe, the Department of Commerce has been invited to send delegates to your convention. The hearty appreciation of your invitation, as indicated by its prompt acceptance, places me in the happy position of bringing you Secretary Redfield's greetings and best wishes in your work and to extend to you his offer of hearty coöperation with the American Pharmaceutical Association along any lines within the proper scope of the Department of Commerce, subject, of course, to such limitations as may be imposed by the appropriations granted by Congress.

The work of the Bureau of Standards is, perhaps, more closely allied with your aims than that of any of the other bureaus of the Department of Commerce and I have been assigned to briefly indicate wherein that Bureau might be of service to your organization.

According to your articles of incorporation one of the principal objects you labor for is, "the establishment of uniform standards for the use and guidance of those engaged in the practice of medicine and pharmacy in the United States." *Standardization* is also the basis of all our own activities. The Bureau, which I have the honor to represent, is in fact a national standardizing and research institution, research being essential for arriving at a proper solution of practically every problem presented.

To briefly indicate the scope of our work, I might say that standards of weight or measure are involved in practically every commercial transaction. One of our functions is therefore the custody of and maintenance of standards recognized by the Government. (Using the term *standards* in its broadest sense.) Thus we have the more familiar standard of length, mass, capacity, etc. In some cases, standards are primarily defined in terms of the metric standards of length and mass and the unit of time. It is, therefore, necessary in such cases to provide also for the *construction* of standards to the highest accuracy of reproduction, from their definitions as well as for their maintenance and custody after construction. The standards used in the measurement of electrical quantities belong to this class.

It is however not only necessary to provide for the custody, maintenance and the construction of standards, but it is also essential to provide means for putting these standards into actual use. This is accomplished by furnishing the individual states with certain standards used in their weights and measures inspection service, and by providing facilities by which manufacturers of standards and measuring apparatus, municipalities, scientific and industrial standardizing and research lab-

oratories, colleges and universities, and all others interested may have their own standards and measuring apparatus verified and attested thus laying the foundation for general uniformity.

When the Bureau was first organized there was practically no inspection of commercial weights and measures in this country, only a few States and a few of the larger cities were doing anything whatever, and as a consequence false and incorrect weights and measures were the rule rather than the exception. Following the organization of the State weights and measures officials into a national association, which meets annually in Washington, new laws have been drafted and passed by a majority of the States. In the States of Massachusetts and Wisconsin not only are the sealers testing weights and measures used by pharmacists in selling to the public but they are also testing such measuring glassware as cylinders and cone graduates to see whether they are constructed in accordance with specifications. It need only be suggested that every effort should be made to coöperate with the local sealers in their administration of the law. All measuring apparatus sold should be correctly graduated and, where there are specifications adopted by the State in which the sale is made, they should be complied with.

Inasmuch as the specifications heretofore adopted by the States for weights and measures have not been uniform and are not likely to be, the Bureau is seeking authority to officially approve the design and construction of all weighing and measuring apparatus used throughout the United States, subject to requirements of accuracy and limits of tolerance which may reasonably be expected, such approval to be necessary before the apparatus can be sold and after approval such apparatus may be sold anywhere without being subject to State or local regulation.

Among the subjects dealt with by the weights and measures division having a more or less direct interest to your organization, are the following:

1. The relation between the metric units and the U. S. customary units.
2. Standard Density and Volumetric Tables.
3. Specifications for
 - (a) Chemical volumetric glassware,
 - (b) Prescription graduates,
 - (c) Hydrometers,
 - (d) Weights,
 - (e) Sieves.

These will be briefly discussed in the order given.

The fundamental standards for all weights in the United States whether metric, apothecaries, avoirdupois or troy, is the United States Prototype Kilogram. This standard is made of an alloy of platinum with 10% of iridium which is undoubtedly the best material that has yet been found for standards of mass. This standard was made and certified by the International Bureau of Weights and Measures, which is a bureau maintained by a union of 27 of the leading nations of the world. This insures the agreement of the weights of the countries that depend on this international bureau, especially since arrangements are made for the periodical verification of the fundamental standards. The derivation of the apothecaries, avoirdupois, and troy weights from the kilogram insures the maintenance of the exact relations between the various units.

In a similar way our customary standard of length is derived from the international meter by the relation

$$1 \text{ yard} = \frac{3600}{3937} \text{ meter.}$$

The other relations are similarly fixed and equally definite. There would seem, therefore, to be no good reason why different values should be given by different authorities for such equivalents. In looking over tables of equivalents from various sources, however, it is soon discovered that they are neither correct nor uniform. For example, the relation between the liter and the United States fluid dram is given in a certain publication to nine decimal places and the value given is incorrect in the fourth place. The value given is, no doubt sufficiently exact for most purposes, but it would have been much better to have given the value to only four places. This very common practice of carrying values beyond reasonable limits should be discouraged.

A new edition of the Table of Equivalents published by the Bureau will soon be ready for distribution, and it will be found useful in settling many doubtful cases of this kind.

Standard Density and Volumetric Tables. Probably nowhere in scientific literature is there greater lack of uniformity than in density and volumetric tables. Take for example, alcoholometric tables in common use. The names of Gilpin and Bladgen, Tralles, Gay Lussac, Mendeleeff, Morley, and Squibb are familiar to most of you. The alcohol tables of some of these authorities have been in use for about one hundred and twenty-five years. Since these tables are all different the question naturally arises as to which is most nearly correct. In many publications this question is avoided by publishing them all and thus putting the responsibility of a decision upon the user. This is obviously unsatisfactory. The user is in general in no position to judge their relative value and is as likely to choose the worst as the best. For that reason it would be much better for those in charge of any publication to give only a single table or set of tables for alcohol based on what they consider the most reliable piece of work, and omit all others.

Of the investigations in alcoholometry Mendeleeff's work, carried out about 1865, is unquestionably superior to anything done up to that time and is worthy of all the re-calculation it has been subjected to. Nearly fifty years, however, have elapsed since the work of Mendeleeff, and in that time considerable advance has been made in the refinement of physical and chemical methods. It was thought advisable, therefore, that similar work be done under the best possible modern conditions, and in 1910 the work was undertaken at the Bureau of Standards. This work has now been completed and the results published in the Bulletin of the Bureau and also in a circular of standard density tables. These tables have been adopted by the Bureau and are coming into very general use. We believe that they are superior to any alcoholometric tables ever published and that they should be universally adopted, to the exclusion of all others.

Another case of lack of uniformity in the use of tables is that of the Baumé scale. This is an arbitrary scale supposed to bear a certain relation to specific gravity. In 1881 the question of Baumé scales was studied by Prof. C. F. Chandler of Columbia University, and in a paper read before the National Academy

of Sciences he stated that he had found twenty-three different scales for liquids heavier than water and eleven for liquids lighter than water. It will readily be understood that such an array of tables, all passing under the same name, would inevitably lead to confusion. This confusion, though now reduced to some extent, still exists, as may be seen by consulting recent publications. There has, however, been manifested a decided tendency to discard most of the early so-called Baumé scales and, at the present time, there are in use in this country only only a very limited number but there is still opportunity for further reduction.

In 1903 the Manufacturing Chemists' Association of the United States adopted two definite Baumé scales, one for liquids heavier than water and one for liquids lighter than water. These scales are based on the following relation to specific gravity:—

For liquids heavier than water,

$$(1) \text{ Degrees Baumé} = \frac{145}{\text{Sp. Gr. } 60^\circ} - \frac{60^\circ}{F^*}$$

For liquids lighter than air,

$$(2) \text{ Degrees Baumé} = \frac{140}{\text{Sp. Gr. } 60^\circ} - \frac{F}{60^\circ} - 130.$$

When the work of testing hydrometers was undertaken by the Bureau of Standards, the good example that had been set by the Manufacturing Chemists' Association was followed by the Bureau, the same two Baumé scales being adopted. At that time careful inquiry was made and it was learned that all manufacturers of hydrometers in this country were using, or at least thought they were using, the same two scales though it has since developed that a certain manufacturer of hydrometers for the oil trade, is, through an error, still using a different Baumé scale.

In the last edition of the U. S. Dispensatory, are given three tables of liquids heavier than water, and three for liquids lighter than water. Two of these in each case should be omitted.

The third subject I had in mind to discuss, was specifications for various kinds of laboratory apparatus. Volumetric glassware is discussed in detail in Circular No. 9 of the Bureau and need not be considered at length here. I would, however, like to call your attention to two points, namely, the unit of volume and the standard temperature. In all volumetric analysis the unit of volume should be the liter, defined as the volume occupied by a kilogram of pure water at the temperature of its maximum density. For convenience the one-thousandth part of the liter called the millimeter or the cubic centimeter is used for small quantities. It should be clearly understood that this unit of volume called the ml. or the cc. is the one-thousandth part of a liter and not the one-thousandth part of a cubic decimeter. For practical purposes in volumetric analysis the two are equal, but for

* Sp. Gr. 60°/60° F. means the specific gravity at 60° F. in terms of water at 60° F. as unity.

more precise calculations the difference which amounts to approximately .003% should be taken into account.

In regard to the standard temperature, it may be said that there is some question whether 20° C. or 25° C. is preferable. 20° C. has been chosen by the Bureau as being closer to the actual laboratory temperature throughout the year, but it is probable that 25° C. is closer to that of a chemical laboratory under normal working conditions. However, the Bureau advocates the general adoption of 20 degrees as the standard temperature, in the interest of national and international uniformity. In any case the really essential thing is that each piece of volumetric apparatus be marked with its standard temperature. If standardized at 20° and used at 25° or *vice versa*, it is a simple matter to correct from one temperature to the other, whenever the accuracy required makes it necessary.

In regard to prescription graduates, the Bureau is not yet in position to make any definite recommendation, except that uniform specifications should be adopted in the different states. The question has only recently come up for consideration by the Bureau, and by weights and measures officials throughout the country, and is at present in a rather unsettled state. The types of graduates to be approved and the accuracy to be required, are very important questions and will receive careful consideration.

The question of hydrometers, is fairly well covered by Circular No. 16 on the Testing of Hydrometers, and by the hydrometer tables in Circular No. 19. What has been said in regard to standard density tables, applies with equal force to standard hydrometers. One thing may be said as a word of warning to those who may have occasion to use hydrometers; that is, no instrument should be assumed to be correct, unless it has been tested by direct comparison with a certified instrument, or by some other means sufficiently exact for the purpose. It is possible to make hydrometers of surprisingly high accuracy, and certain manufacturers are putting out that kind of instruments, but unless the name of a reliable manufacturer is on the instrument, it should not be depended upon and even then it is much safer to test it.

Sieves.—The fineness of a powder, is usually expressed in terms of the sieve through which the powder will pass, and the fineness of the sieve, is given in the number of meshes to the inch, and by the diameter of the wire of which the sieve cloth is made. It is evident, therefore, that in order for the fineness of a powder to be definitely given in terms of a sieve, both these factors of the sieve must be known.

The diameter of the sieve wire, is usually expressed in terms of its so-called "gauge." Now it so happens that there are several wire gauges in use in this country, and for that reason the statement that the wire of a sieve shall be of a certain gauge, is not sufficient to fix the diameter of the wire.

Two of the most important sieve manufacturers in the country use different wire gauges, and for that reason a No. 36 wire to one of them is by no means a No. 36 wire to the other. That being the case, when the statement is made that a No. 60 powder is one that will pass through a 60 mesh sieve of No. 36 wire the question at once arises as to whether it is intended to mean the 60 mesh sieve of one of these manufacturers or the other. A simpler and more satisfactory method would undoubtedly be to specify the diameter of the wire, instead of any gauge

number. This practice is coming more and more to be followed and thus all ambiguity avoided.

The recent revival of interest in the metric system furnishes another avenue through which the Bureau may coöperate with your association. In the performance of its functions the Bureau is required to study every phase of the weights and measures question; and in common with all who have given this subject deep study and attention, has reached the conclusion that the adoption of the metric system by the United States would be a most important step in the development of its social and commercial progress. The Bureau has neither the time nor the inclination to take the lead in the movement to render the use of this system compulsory throughout the country. However it does not hesitate to express its favorable opinion when occasion requires. It is manifest that, under our form of government, such a change can only be brought about by an expressed public demand which has thus far not been forthcoming. The action in your organization regarding the metric system, is a move in the right direction and will be followed by others. The increasing interest in the metric system, is evidenced by the great and increasing demand for the metric chart published by the Bureau.

The bearing of the work of the Chemical Division of the Bureau, upon that of this Association and its various committees of revision is quite obvious.

Atomic Weights. In the Eighth Revision of the Pharmacopœia, the table of atomic weights based upon hydrogen = 1, is in use. Since 1906, all the tables published by the International Committee on Atomic Weights have been based on oxygen = 16; which is now almost universally used. For the sake of uniformity and convenience, no doubt the new international basis will be adopted by your association, even though such a change would involve the revision of a considerable number of tables, and of the factors used throughout the text.

The Bureau is now planning an exhaustive investigation regarding standards for volumetric analysis. Preliminary to such a study, inquiries for opinions and suggestions were addressed to a large number of chemists, including some engaged in pharmaceutical work. The replies were, in practically all cases, favorable to such an investigation, and, at least, three pointed out the specific need of more accurate information regarding methods of testing pharmaceutical products. It is unfortunate that the results of any such work, will not be available for use for the next revision of the Pharmacopœia. We are not now in a position to make any specific recommendations regarding the standardization or use of acidimetric or iodometric solutions. Sufficient work has been done however upon the standardization of permanganate solutions, to warrant our selection of sodium oxalate as a primary standard, which is now sold by the Bureau as a standard sample. For a summary of the information upon this subject, I would refer you to Circular No. 40, on "Sodium Oxalate as a Standard in Volumetric Analysis." We suggest therefore that standardization of permanganate by means of sodium oxalate, be included at least as an alternative method in the forthcoming Pharmacopœia.

Testing of Reagents. Information secured at this Bureau and from numerous other sources, has indicated the great need of taking measures to improve the quality of chemical reagents, especially those bearing analysis-labels. No doubt

the same situation exists, at least in some degree, with respect to pharmaceutical preparations. As a necessary preliminary to effective steps in this direction, we hope to make a study of the delicacy and suitability of the tests used to detect or determine the impurities present in such materials. The results of such a study, will no doubt be of considerable value in fixing and maintaining standards of purity for chemicals to be used either for pharmaceutical or analytical purposes.

Our ability to take up the experimental problems outlined depends, however, entirely upon the willingness of the legislative bodies in Congress to provide the ways and means. The work contemplated covers a vast field and calls for the uninterrupted services of a good many chemists of high grade over a good many years. If taken up at all, it is probable that these problems will have to be attacked by degrees and that the progress will be slow. While the Bureau of Standards is preëminently an institution in which researches of this kind might be prosecuted, we are in no position to give guarantees of any kind, since we, obviously, have no independent control of funds for maintaining large researches of the kind in question.

There is a further reason which makes it out of our power to accomplish much along new lines of work for the next two years, and that is our lack of room to accommodate the men who are to do it. However, Congress has only recently authorized the construction of a new building, as large as any now in the Bureau of Standards grounds, which is to be devoted entirely to chemistry and is planned to house over 100 workers instead of the 45 or 50 now employed.

Pharmacists may also be interested in many other lines of work of the Chemical Division, for example the work on methods of rubber analysis. Rubber goods are often sold under guarantees which mean nothing, but if bought under standard specifications and tested in accordance with reliable chemical methods and subjected to proper physical tests, it would result in general satisfaction to the buyer, as well as the druggist who now sells merely on the makers' claims and guarantees.

The Bureau is also actively engaged in investigating the methods of specifying color standards, in the establishment of reliable color standards and in the development of methods of color analysis. The relation of such work to your aims is of course obvious.

In addition the work of the Bureau on Polarimetry might be mentioned. The methods of polarscopic analysis are described in Circular 44. New apparatus has been designed for precision-polarimetry and besides the Bureau has placed on sale sugar of exceptional purity by means of which, instruments may be tested through solutions of known concentration.

The work of the Bureau on Chemical thermometers is too well known to require more than brief mention. Besides it will be dealt with more fully by Mr. C. A. Mayo in a paper before the Section on Practical Pharmacy and Dispensing

One of the great problems that confronts the Bureau of Standards, as well as the Government in general, is that of getting into touch with the people of the country. All the theoretical knowledge and all the splendid equipment of the government, is of little value unless it accomplishes something, and certain of this information and equipment can best accomplish its purpose through the

various mediums of the Government publications, and publicity given to these publications by the organs of Societies such as yours.

Among the publications of the Bureau of interest to members of your association are the following:—

The National Bureau of Standards, (Descriptive Pamphlet).

History of the Standard Weights and Measures of the United States.

Metric Chart.

Metric Pamphlet.

Units of Weight and Measure, (Definitions and Tables of Equivalents).

Circular No. 3, Verification of Standards of Mass.

" 5, Testing of Chemical Thermometers.

" 8, Testing of Thermometers.

" 9, Testing of Volumetric Apparatus.

" 16, Testing of Hydrometers.

" 19, Standard Density and Volumetric Tables.

" 24, List of Publications of Bureau of Standards.

" 38, The Testing of Rubber Goods.

" 40, Sodium Oxalate as a Standard in Volumetric Analysis.

" 44, Polarimetry.

Scientific Paper No. 17,

Scientific Paper No. 92. The Testing of Volumetric Glass Apparatus.

Scientific Paper No. 197. Density and Thermal Expansion of Ethyl Alcohol and its Mixture with Water.

These may be obtained free of charge by application to the Bureau of Standards.

I have perhaps given sufficient examples to bring out the statement made in the beginning, that standardization is to be desired above all else both in the work of this association and in that of the Bureau of Standards. If by working together we can help to bring about that end then our work will not have been in vain.

REPORT OF THE COMMITTEE ON PHYSIOLOGICAL TESTING.

The Members of the American Pharmaceutical Association.

GENTLEMEN: We may briefly report that the following is an epitome of the work that has been published on the subject of Physiological Testing in this country and abroad during the past year:

I. *Ergot*.

Dr. Wm. A. Pearson, Journ. Am. Pharm. Assn., 1913.

The Blood Pressure Method of assay is recommended on the basis of the vasoconstrictor action of active extracts of *Ergot*. Tracings are shown which apparently correctly indicate the degree of activity by the rise in blood pressure of an anæsthetized dog. The effect on the cock's comb is claimed to be due to this action.

Paul S. Pittenger and Chas. E. Vanderkleed, Journ. A. Ph. A.

These authors suggest the use of the excised guinea pig uterus for assaying *Ergot* extracts and submit tables to show the parallelism between the uterine and Blood-pressure Methods, and tracings to show the sensitiveness of the method.

This method had been recommended by Kehrer Archiv. f. Exp. Path. u. Pharm., 1908.

Chas. C. Haskell, Jour. A. Ph. A., 1914.

The author considers the uterine method of assay to be the only logical one and that the blood pressure test has no relationship to the activity of a preparation, for obstetrical purposes, while the uterine and cock's comb methods seem to parallel each other.

II. *Pituitary Extracts.*

Herman Fuhner, From Zeit. f. d. Gesamte Exp. Medizin, 1914.

The excised uterus of the guinea pig is recommended as the only logical tissue to use for testing these extracts. The article is replete with tracings showing the variation in contractions of the uterus resulting from various doses of the active extracts.

H. H. Dale, P. P. Laidlaw, Zeitschr. f. Biol., 1913.

Jour. Pharmacology and Exp. Therap., 1912.

The uterus method of assay is described in detail with tracings to show its applicability.

Fritz Heidelberg, Paul S. Pittenger and Charles E. Vanderkleed,
Jour. A. Ph. A., 1914.

This is essentially a corroboration of the findings of the preceding authors.

III. *Digitalis Preparations.*

R. Gottlieb, Mun. Med. Woch., 1914.

The frog heart method is not objected to, but the sources of error are pointed out. He calls attention by protocols, to the necessity for using a considerable number of frogs in any assay so that these errors, such as variation in resistance due to known and unknown causes may be obviated.

R. Heinz, Merck's Report, 1913.

The author suggests a number of methods for standardizing these preparations each of which has its field for determining some specific action. Five different methods are summarized without indicating the choice of the author.

Chas. C. Haskell, Am. Jr. of Pharmacy, 1914.

The use of guinea pigs is recommended in assaying the digitalis preparation because of the relatively uniform resistance the pigs have. Seasonal variation, however, is an important factor. The interesting fact was brought out that alcohol, in the preparations tested, has a protective action and decidedly lowers the toxicity.

Chas. E. Vanderkleed and Paul S. Pittenger.

Journ. A. Ph. A., 1914.

The slight seasonal variation in sensitiveness of guinea pigs to the action of the onabian is proved by an extensive series of experiments.

IV. *Cannabis Sativa*.

C. R. Eckler and F. A. Miller, 8th Inter. Cong. of Applied Chemistry, 1912.

The activity of American grown *Cannabis Sativa* is claimed to be inferior to that of the Indian grown drug, whether from native seed or seed taken from the imported drug. The method of assay is described in detail.

H. C. Hamilton, A. W. Lescohier and R. A. Perkins,
J. A. Ph. A., 1913.

The comparative activities of the extracts of American and Indian-grown drug were tested by these authors noting and describing the effects produced by the two extracts on the same subject.

Early in the year it was not deemed wise to undertake active laboratory work on the important problems of physiological testing, as the Chairman of the Sub-committee of the American Pharmacopœial Revision Committee stated that it had been decided not to introduce into the Pharmacopœia methods for the physiological assay of drugs; but to recommend certain methods to be used when desired. The information relative to these recommendations was expected to have been available several months ago so that the members of our Committee could consider the material which would appear in the Pharmacopœia and determine its practical bearings. Up to two weeks ago, however, this data was not available. Various members of our Committee were asked for assistance by the Chairman of the Sub-committee and such has been cheerfully given.

We would recommend that the Committee on Physiological Testing be continued for another year, in order that it may give careful detailed consideration to whatever statements are finally made in the new edition of the United States Pharmacopœia and report to the American Pharmaceutical Association the practical bearings of the recommended methods. Also to consider and report upon any other subjects that seem to be of practical importance.

Very truly yours,

E. M. HOUGHTON, Chairman,
PAUL S. PITTINGER.

August 26, 1914.

REPORT OF COMMITTEE ON EBERT PRIZE.

To the Scientific Section of the American Pharmaceutical Association.

GENTLEMEN: After a careful examination of the papers presented to this Section at the Nashville meeting the Committee on awarding the Ebert Prize begs to report that in its opinion one of these papers meets the requirements of the donor, although there are several which have many merits.

EMERSON R. MILLER,
B. L. MURRAY.

Papers Presented at the Sixty-Second Annual Convention

MEDICINAL PLANT GARDENS.

DR. W. W. STOCKBERGER,

Physiologist in Charge of Drug-Plant and Poisonous-Plant Investigations,
Bureau of Plant Industry, United States Department of Agriculture.

It is not my intention in this paper to present a descriptive account of Medicinal Plant Gardens in general, or even to discuss the more important ones of this country, except in so far as reference to them may be necessary by way of illustration. I shall endeavor, however, to point out what to me appear to be some popular misconceptions concerning the scope and function of such gardens, and to suggest how they may be made to increase their usefulness to *Materia Medica* and Pharmacognosy.

For the purpose of this discussion Medicinal Plant Gardens may be regarded as falling under one of two general classes, the first being pedagogic, the second industrial. The pedagogic garden is naturally an adjunct of a School of Pharmacy, or of a Botanic Garden. Its scope includes all medicinal plants that are adapted to existing soil and climatic conditions, supplemented by greenhouse facilities. Its function is to familiarize students with the habit and appearance of the entire living plant, some part of which is used as a plant drug, to supply the need for authentic specimens for observation and demonstration in the classroom, and to furnish materials for research work on the morphology and chemical constituents of drug plants. Necessarily it will be found desirable to grow a large number of species in this type of garden, but, owing to the cost of maintenance, the space which can be devoted to any one species will be very small.

The industrial garden, on the other hand, is an adjunct of public or private enterprises, the object of which is to give additional information concerning our agricultural resources. Its scope is the same as that of the pedagogic garden, but it differs very materially in function which is to serve for the determination of the adaptability of medicinal plants, not only to soil and climatic conditions, but to economic conditions as well. In the industrial garden, a large number of species will be tested on a small scale to determine whether the soil and climate are suitable for their growth, then the few promising ones must be tried out on an area large enough to yield reliable data on the actual conditions of commercial production. A considerable acreage of land is indispensable for this type of garden, if the results secured therein are expected to have much economic significance.

There is no lack of evidence that the general public often, if not as a rule, fails to differentiate the functions of the pedagogic and industrial gardens, since advice

is freely sought from both regarding the production of medicinal plants for the sole purpose of deriving profit therefrom. It is also an open question whether this distinction in function is in every case clearly understood by those responsible for the management of medicinal plant gardens. Statements sometimes unguarded, or not properly qualified, and sometimes based upon inconclusive and insufficient data, have on several occasions inspired the imagination of writers for the popular magazines or daily press, and, as a result visions of large and easy profits have been portrayed under various alluring titles, as, for example, "Big Profit from Drug Weeds," "The Herb Grower Has a Chance at an \$18,000,000 Business," "A Profit of One Hundred Dollars Per Acre from Growing Medicinal Weeds." Moreover, the wide-spread interest in the possibility of growing medicinal plants for profit, which has been developed in this country during the past decade has been capitalized by a number of crafty promoters, who use the mails and the columns of journals and magazines to disseminate flamboyant advertisements of the enormous profits which may be made by growing certain medicinal plants. Frequently, the name of the plant is withheld until the victim has remitted from one to five dollars, for which he receives practically valueless instructions for the cultivation of some plant poorly adapted to our economic conditions. A typical get-rich-quick scheme, of this class, is explained thus: "It has to do with a certain plant which grows like a weed; it is cut and cured like hay and sells for 45 cents per pound, which is at the rate of \$900 per ton." The investment of one dollar brings the name of the herb with the further information that the product of one acre will sell for \$1800!" As a matter of fact the commercial cultivation of this plant is almost unknown in the United States, and there is yet no established market for the American product.

These illustrations will account for the doubt which has arisen in my mind as to the propriety of purely pedagogic gardens being used as a basis for generalizing on the question of drug growing for profit. In agricultural experimentation, it is well recognized that the results from small trial plots must be interpreted with due regard for the large factor of error, which is always present. With proper care and attention, it is relatively easy to grow a luxuriant crop of any one of a number of drug plants on a square rod of good garden soil but what can be done under ordinary agricultural conditions on one or more acres can not be calculated therefrom by "a simple sum in arithmetic," as one writer has naively said.

There are numerous well authenticated instances in which the production of some medicinal plant has resulted in a fair profit, but there is yet no evidence at hand to justify the belief that satisfactory results can be secured without some practical experience in gardening, some knowledge of the requirements of crude drugs and due regard for economic conditions.

Every pharmacist and physician is or should be interested in obtaining crude drugs of highest quality and standard efficiency, but material progress toward the attainment of this end will not be favored by encouraging a large number of persons to become small producers. The result of small individual collections varying widely as to time, place and method of gathering is seen in the miscellaneous aggregates all too frequently found in our crude drug markets, and unless a perpetuation of this condition is desirable, little encouragement should be given

to the suggestion that whoever has a small back yard available may become a producer of plant drugs.

The educational opportunity open to the pedagogic gardens is almost limitless. The dissemination of knowledge to countless individuals not having access to the garden itself regarding the history, geographic distribution, methods of preparation and uses of crude drugs may be accomplished through illustrated lectures and carefully prepared articles written for the less technical periodicals. Such misconceptions as, for example, that the production of ipecac in New England and vanilla beans in Iowa is a commercial possibility, or that stramonium is produced by a "melon weed" are all too prevalent, and should be corrected. But educational work along this line deserves little tolerance unless inspired by some motive more commendable than that of merely arousing interest in growing drug plants, otherwise the whole movement will sooner or later be discredited. Recently a reputable pharmaceutical journal published an article in which the writer set forth at some length the possibilities for the commercial production of a certain drug plant in the southwest. A request for further information brought forth from this writer the astounding statement that he had no personal knowledge of conditions in the southwest, but, *having grown this plant in one of the northern States*, he saw no reason why it should not be profitably grown in the southwest "on rocky and otherwise unprofitable land, on hillsides or arid desert soil." In this case, the motive was evidently merely the arousing of interest, and the writer mentioned displayed a fine disregard for the practical difficulties attending the growing of the plant in question which sharply localize the areas on which it may be economically produced.

The time is certainly ripe for injecting into discussions and recommendations regarding the cultivation of medicinal plants some of the sanity and discrimination which characterize conservative business operations. Such a course is necessary if the interest already aroused is to be retained and directed along lines productive of beneficial results. It should be remembered that the expense of agricultural operation varies widely according to location. In some localities, the outlay for farm labor will be three and one-half times as much as in others. Sometimes we find a low expense for labor associated with a heavy outlay for fertilizers, sometimes heavy expense for both labor and fertilizers, and, again, low expense for both. The complications introduced by these factors alone render it practically impossible to make any safe general statement as to the profitability of drug growing. Furthermore, two localities separated by a distance of less than fifty miles may present a totality of conditions so different that a drug-growing enterprise which could probably be conducted at a profit in the one would with equal probability fail absolutely in the other.

I do not wish to be understood as taking the position that there is no opportunity in the cultivation of medicinal plants, for I have abundant evidence that given the *necessary favorable conditions* a fair return may be expected from several drug crops. On the other hand, I also have abundant evidence that hundreds of persons have received the impression that drug crops can be grown by anybody anywhere at a profit far in excess of that to be obtained from ordinary cultivated crops. I am convinced that in some cases optimism and enthusiasm have

been allowed to outrun common sense, but if in the future due consideration is given to the fundamental principles of agricultural economics, I believe that a rational attitude toward commercial drug plant cultivation may be developed.

The founders of the several excellent pedagogic gardens which are now maintained in connection with certain Schools of Pharmacy have inaugurated a movement which promises much for the future of *Materia Medica* and Pharmacognosy. It is sincerely to be hoped that their example will lead to the establishment of such gardens in connection with each of the 75 or more Schools of Pharmacy in the United States, and to an extension of the scientific study of medicinal plants. The problems demanding attention are very numerous, but some of the lines of study and investigation which need to be emphasized are those concerning the adaptation and acclimatization of medicinal plants, the conditions under which the active principles of plants are formed, and the behavior of the plants themselves under varying conditions of climate and culture. Moreover, the selection and breeding of medicinal plants not only promises to yield results of great practical importance, but also affords a field for the widest scientific activity.

It is to be regretted that at present there is no satisfactory way in which the investigations being made upon medicinal plants in different sections of this country can be properly correlated and reduced to form for definite comparison. Especially desirable is a practicable basis of correlation for studies of the variation in plant constituents due in part, at least, to differences in geographical location. When two more or less widely separated workers attempt to compare the results of their studies, it frequently happens that they experience the greatest difficulty in harmonizing their results. This is due in part to differences in the response which plants make when under different environmental conditions, in part, probably, to variations in the method of procedure followed in the cultivation, curing and analysis of the plant, and in part, no doubt, to differences in the genetic relationship of the plants studied by the respective investigators.

There seems to be an opportunity for some arrangement or mutual agreement between the representatives of our various medicinal plant gardens, under the terms of which, multiply samples of seeds or plants of common parentage could be distributed for the production of plants to be used experimentally. If under such an agreement, uniformity of treatment, throughout the processes of culture, curing and analysis could be secured, comparison of results would be much more profitable than at present, and the tabulation and summarizing of the results of experimental work conducted along the lines indicated in a number of localities would permit the drawing of conclusions having a significance far greater than those that can be reached by a single isolated worker. The suggestions here offered, contemplate nothing like a general coöperative investigation, but rather the adoption of what might be regarded as a standard method of procedure analogous to official methods of analysis, etc. The tabulation and summarizing of results might well follow individual publication, as no other course is likely to give satisfaction.

In conclusion, I wish to say that the resources of the experimental drug gardens of the Office of Drug-Plant Investigations, Bureau of Plant Industry, are open to any School of Pharmacy desirous of starting a medicinal plant garden, as are

also the facilities of that Office for effecting the distribution of material for experimental purposes, and for furthering the collection and compilation of data on the cultivation of medicinal plants under great diversity in conditions of growth.

DISCUSSION.

MR. FRED T. GORDON: May I ask Dr. Stockberger, have you ever noticed any difference in the attacks of insect pests on plants? For instance, we had the army worm in Philadelphia not long ago, and they ate every blade of grass as they moved forward, but they would not touch clover, and in the same way certain insects eat certain vegetables and leave certain weeds alone, like milkweed. Do insects attack such plants as belladonna?

DR. STOCKBERGER: Yes.

MR. GORDON: I know that insects do not seem to attack stramonium very much, although there is an insect, the tobacco worm, which eats tobacco. I was questioning whether there were any special differences in plants in this respect.

PROF. KREMERS: I should like to see the question brought up and discussed. I may say, although I am not a very close observer of animal life, that I have had occasion in recent years to have my attention drawn to things of this sort. Indeed I should enjoy an opportunity for study along this line, and to observe more.

With regard to stramonium, for instance, this plant is attacked by insects. When you pick up a stramonium leaf you will find it perforated with hundreds and hundreds of small holes. If you approach a field of stramonium, from a distance of several rods you will hear a peculiar noise. It is a very faint noise, in a way, and yet the noise reminds one of the distant roar of the ocean waves. This noise is made by countless small beetles, which upon your approach rise and then settle down again. The noise thus produced reminds one of the surf.

We have experimented with something like fifteen or twenty species and varieties of stramonium, and we have found that practically all of them, except one, I have forgotten which, is attacked by this particular beetle. If we could effect a hybridization of the other species of *Datura* with this one, which would give us the alkaloid-content desired, and also the necessary resistance, and thereby eliminate these beetles, we could produce a much finer looking drug than we can at present.

I have also observed the Colorado beetle or common potato bug on hyoscyamus. Both instances clearly demonstrate that alkaloids do not necessarily render plants beetle-proof.

In connection with the remarks made by Dr. Stockberger, I should like to call attention to a somewhat discouraging feature in drug standardization. For some years past, we have had occasion to make a special study of stramonium. In connection with this work, we have made a compilation of all the stramonium-assays we could find in the world's literature, and not a single generalization could be drawn from all of them. We began work of our own, and compared the results of two consecutive years from materials obtained from the Northern Station for the Cultivation of Medicinal Plants. In writing up the results, we naturally drew conclusions. We did not, however, publish our data immediately. Because of the results obtained, during the third year of the investigation, we were obliged to strike out our generalization upon each and every variety that we had studied.

This is not very encouraging. We are now starting work along the line of plant breeding, and if we can continue this for five or ten years we may secure some results. That is the character of the work that has to be done.

One feature that possibly needs emphasis in connection with drug cultivation should be mentioned. As a simple illustration, let me again use stramonium, will suffice. When the Pharmacopœia of 1900 or 1904 went into effect, it called for 0.35 percent of alkaloidal content, if I am not mistaken. Soon complaints were received from drug jobbers and pharmaceutical manufacturers that stramonium of that strength was not obtainable in quantity. Stramonium was then put down to 0.25 percent alkaloidal content. Any ignorant drug-collector can get stramonium that will come up to this requirement.

What we should have done was to have established a proper standard and have adhered to it, but we should also have given the market sufficient time to adjust itself to the new requirement.

Again, I suppose, it is too late now. After ten years nothing has been done. If we revised the Pharmacopœia as it ought to be revised, we would insist on the right standard after having given people an opportunity to raise stramonium. We can raise, without trouble, stramonium on good garden soil, and we can raise it on poor agricultural soil with 0.35 percent alkaloidal content. But, as long as the Pharmacopœia calls for 0.25 percent, there is no use trying to raise stramonium with 0.35 percent.

The people down south can go and collect a handful of stramonium and take it to the corner-grocery and get their pipe of tobacco, or bottle of whiskey for it. That is the way drugs are frequently collected. As Dr. Stockberger has remarked, our "crude drugs" are frequently exceedingly crude.

I do not want to take up too much of your time, but I might say a word about the present war-situation. I am not a believer in war, and I do not know that there is any justification for the war. But if we had had warning that this war was coming, and known the result, we might have produced sufficient thymol for the United States in northwestern Wisconsin. However, it is too late now.

Monarda punctata grows freely in the sandy areas along the lower course of the Wisconsin river. This plant yields from one-half to one percent of volatile oil, fifty percent of which is thymol. Whereas the related species, *Monarda fistulosa*, grows abundantly on heavier soil, it seems difficult to propagate the former species in the heavier soils of our gardens or farms. Nevertheless *M. punctata* may be improved by cultivation on poor sandy soils. Thus it has been shown that a straggling wild plant, when transplanted and cultivated, is greatly improved. The former may be a foot or two high, with a few straggling branches six inches long. After cultivation in the same soil, this same plant could not be covered by a bushel basket.

In connection with this plant, a few observations have been made that throw some light on the attitude of animals toward plants. Both *Monarda fistulosa* and *M. punctata* grow wild in the meadows, but neither is touched by grazing cattle. However, if the oil, which, as already stated, contains fifty percent of phenols, is removed by distillation, cattle and sheep will feed on the exhausted material. During a summer that produced a scarcity of hay, such exhausted *Monarda* was sold for the price of hay.

Man's relation to the genus *Monarda* is very similar. Thus *Monarda didyma* has long been used as a substitute for tea but not the botanically related *punctata* or *fistulosa*. Whereas the latter contain a fair amount of volatile oil, fifty percent of which consists of phenols, the former contains but a trace of oil, none of which is phenolic in character.

The behavior of cattle toward wormwood is quite parallel. In some of the wormwood fields, cattle are used, up to a certain stage in the development of the plant, for weeding. They will keep down the grass without eating the wormwood. However, after the oil has been removed by distillation, the exhausted herb is eaten by the animals. Hence, wormwood culture and cattle raising have developed hand in hand.

No doubt, there are a number of medicinal plants that might be cultivated advantageously. However, we must not play with the standards, as we have done in the case of stramonium. Moreover, we must learn much more about the cultural conditions, as illustrated by the monardas, plants so well known in the wild condition, but which we have not yet mastered for economical purposes in garden and field.

ACTION OF PEPSIN AND TRYPSIN ON ONE ANOTHER.

Excess of trypsin inhibits the digestive action of pepsin in acid solutions, and excess of pepsin hinders the digestive action of trypsin in alkaline media. In both cases the inhibition is directly proportional to the amounts of the enzymes present.—E. S. Edie (Biochem. J., Chem. Abstr. Amer. Chem. Soc., 1914, 8, 2399).

A SIMPLE FORM OF NITROMETER FOR THE ASSAY OF SPIRIT OF NITROUS ETHER.

THEODORE J. BRADLEY.

The nitrometers on the market have been designed for general use and not particularly for the assay of Spirit of Nitrous Ether, and they are, generally, expensive and complicated and more or less troublesome to use. During the past year the writer has had occasion to make a number of assays of this preparation and a special form of instrument was devised for this work.

The following features are found in this new form of nitrometer: it agrees in all essentials with the official general description, given on page 576 of the *Pharmacopæia*; it is simple and compact and of good appearance; it is complete, so that when one is ordered it is received ready for use; and its cost is moderate.

The instrument, as shown, consists of a glass tube about 16 inches long and graduated, from the top downward, to 50-cc. in fifths. At the top this graduated tube is contracted and has a stopcock connecting it with a cylindrical funnel which is also graduated at 5 cc. and 10 cc. The graduated tube, below the graduation, is expanded to form a bulb of about 75 cc. capacity, and below this there is a side tube with an open end to be connected with a leveling bulb. The bottom of the instrument is closed and it stands on a removable base, preferably of iron. The leveling bulb is connected with the side tube by about two feet of flexible rubber tubing and is supported by a clamp which is attached to the graduated tube and easily adjusted at any height.

This piece of apparatus has the same general appearance as Schiff's nitrometer and is a modification of that instrument. No great originality is claimed for it but it has proven to be well adapted for its special use. The instrument shown was made to order for \$3.50 by a firm of apparatus manufacturers in New York City. I have no doubt but that this price will be lowered when it is catalogued and made in quantities for regular stock.

DISCUSSION.

DR. BRADLEY'S—This ends the paper, but I should like to demonstrate the nitrometer and have the members discuss it. (Dr. Bradley here demonstrated the use of the instrument.)

Every one understands, I hope, that I have no financial interest in the sale of this instrument. This goes without saying, but I have said it just the same. Not many pharmacists realize that the assay of nitrous ether is a very simple operation, if we have a nitrometer. The actual work can be done inside of ten minutes, followed by a necessary wait of about a half an hour for the complete generation of the gas, and its change to room-temperature.

To fill this nitrometer or any form of a similar general character, we fill the leveling bulb about half full. There is an immediate passage of the liquid to the expansion bulb. It is necessary to stop at this point and expel air bubbles from the rubber tube. This can be done by squeezing it tightly, several times. (Indicating.) Then, if the leveling bulb is raised, the salt solution will fill the nitrometer. When the graduated tube is exactly filled we close the stopcock and lower the leveling bulb.

The instrument is now ready for use. In the official process the first step is to shake the sample of spirit of nitrous ether with a small amount of potassium bicarbonate to neutralize any free acid. Then an ordinary 100 cc. measuring flask is weighed and about thirty grams of the sample are introduced and it is weighed again. Then we bring the volume of the liquid to 100 cc. with alcohol and mix. I have already done this part of the work and we can go right on with the assay. For ordinary store work you will find that the instrument is accurately graduated. We measure 10 cc. of the diluted sample in the funnel. This is then allowed to enter the graduated tube, being careful that no air follows. It may be safer to allow the last drop to remain in the funnel tube. It will be washed in by the first reagent. You thereby avoid the risk of air getting into it. 10 cc. of potassium iodid test solution are next measured in the funnel which is a large excess, and not a quantitative amount, and is allowed to enter the graduated tube. A slight reaction immediately ensues. And here again it is necessary to take care that no air gets in the nitrometer or we should have to start over again. The last reagent is 10 cc. of normal sulphuric acid introduced in the same manner as the preceding. I have always considered that it is unfortunate that *normal* sulphuric acid is specified as this is not found in many drug stores and it is troublesome to make. What is needed is but a weak sulphuric acid of about five per cent strength. The normal acid is of about this strength, but the same result is obtained more easily by using a mixture of equal parts of diluted sulphuric acid and water. The pharmacist who is not a well trained chemist might think that the normal strength of the acid is essential, but it is not. There is a large excess of the acid and as soon as it enters there is a violent reaction and our work is done.

It is necessary to allow the instrument to stand for from one-half to one hour. This is directed in the pharmacopœia to allow for the completion of the reaction, and for the gas to come to the room-temperature. Then it is necessary at the expiration of that time to bring the liquid in the bulb to the same level as the liquid within the graduated tube so that we obviate any difference of pressure between the gas inside of the tube and the air on the outside. Then we read the number of cubic centimeters of gas in the tube and calculate the percentage of ethyl nitrite from our first weighing, and this volume, by directions that are given in the pharmacopœia. It is necessary to observe the temperature, and if there is a considerable difference between the room-temperature, and 25° C, a correction must be made, and in this correction the Pharmacopœia says, change the percentage calculated by "one-third of one per cent," of itself for each degree of difference in temperature, and to a person not accustomed to using these figures, that one-third of one per cent of a percentage is very confusing. We calculate a percentage and then we find one-third per cent of that percentage. If the pharmacopœia were changed to read, one three-hundredth of the percentage first calculated, which is exactly the same thing, it would be much clearer.

A very slight correction needs to be made, sometimes, for variations in pressure but this is not necessary for ordinary work. Before I stop, I will call your attention to this expansion bulb. If it were not there some of the sample and reagents would pass over into the rubber tube and perhaps some of the gas would escape through the leveling bulb.

CHAIRMAN RUDDIMAN: I would perhaps make one suggestion. In that apparatus, when you put in your salt solution, you have to be careful not to allow any air in there. Would it not help to have a graduation in this contracted part and then have the five and ten cc. measured from that graduation? In that way you would not run quite so much of a risk.

MR. BRADLEY: I thought of that very thing, but left it out, as it was an additional expense, and because in making my own determinations, I measure the sample with a pipette and that drop is of no consequence. For ordinary work in manufacturing for which the pharmacist would use this instrument, that drop is so small, that it would not materially affect the result, and it can be reduced to a negligible quantity with a little practise.

A MEMBER: Just one little detail I would like to ask about, and that is whether or not it is necessary to shake the nitrometer after the solutions have been added; ordinarily is it considered necessary?

MR. BRADLEY: The pharmacopœia specifies that detail, and I have compared results obtained with and without shaking and find them to be the same.

We introduce the lightest liquid first and the heavier reagents on being added start to sink through it, but they mix on their way down and the shaking is unnecessary. It is very difficult to shake any nitrometer when making an assay and I have stopped doing it.

THE ANALYSIS OF EMULSIONS.*

CHARLES H. LAWALL AND LEROY FORMAN.

The analysis of emulsions by the drug analyst is a branch of work not generally welcomed, because of the lack of specific information on the subject, in books devoted to the analysis of pharmaceutical preparations. Even such recent books as "The Analysis of Drugs and Medicines" by Nelson, and "The Qualitative Analysis of Medicinal Preparations" by Fuller, contain little or no specific information on the subject.

The necessity for doing some practical work along this line, recently led us to experiment with the method known as the Gottlieb Roese Method, which has been used successfully for some time in the estimation of fat in dairy products, and the results were so surprisingly successful, when working upon known mixtures, that the method is suggested for routine work in this connection.

As officially described in the Proceedings of the A. O. A. C. for 1909, Bulletin 132 of the Bureau of Chemistry, U. S. Dept. of Agriculture, an extraction apparatus known as a Rohrig tube, which is now a standard piece of apparatus, is directed to be used. We have found, however, that excellent results can be obtained by the use of a glass graduated cylinder, and the evaporation of an aliquot part of the extraction liquid, although the method as described in full may be used if desired.

The modified method used by us is as follows:

Prepare a mixture of the emulsion in distilled water, so that each 100 cc. of the liquid contains 40 gm. of the emulsion. Take two 100 cc. graduated cylinders and in one, place 10 cc. of the diluted emulsion and in the other, place 5 cc. of the diluted emulsion and 5 cc. of water. To each cylinder then add the following reagents in the order named, agitating thoroughly after each addition:

- 1 cc. stronger ammonia water.
- 10 cc. alcohol U. S. P.
- 25 cc. ether U. S. P.
- 25 cc. petroleum benzin U. S. P.

After the addition of the petroleum benzin, the agitation should be continuous for 10 minutes, after which the cylinders should be allowed to stand until the liquids have separated into two layers with a sharp dividing line, (this requires from 15 minutes to 1 hour). Then having observed the exact volume of the upper layer, draw off exactly one-half and transfer to a flat-bottomed glass capsule and evaporate quickly on a water bath to constant weight. In one of the duplicates the resulting fat will be from 2 gm. of the emulsion, in the other from 1 gm., which gives a satisfactory check upon the thoroughness of the extraction.

* Read before Scientific Section at Detroit Meeting.

Working with emulsions prepared from various oils, the following results were obtained by this process:—

KIND OF OIL	PERCENT OF OIL IN EMULSION	PERCENT OF OIL OBTAINED
Neatsfoot	40	39.87
Corn	35	34.00
Almond	25	24.60
Olive	31.50	31.48
Cod Liver	50	49.72

The emulsifying agent in some cases was tragacanth, and in others was acacia. So much for the quantitative determination of the oil.

Now, in order to ascertain whether the separated oil varied in the more important physical and chemical constants, separate extractions were made, using larger amounts of material and paying no attention to the quantitative feature, the effort being simply to obtain about 5 or 10 grammes of the separated oil. Upon each of these separated portions of oil, the following factors were determined: saponification value, iodine value and refractive index. These values on the samples obtained by extraction, were compared with the same values as obtained from the original oils from which the emulsions had been prepared. No greater deviation in results was noticed than is commonly observed in making duplicate determinations on the same oil.

The results warrant the conclusion that the modified Gottlieb Roesse method may be successfully applied in the analysis of emulsions, both for the quantitative determination of the fat and for the separation of a sufficient amount of the fat for the determination of such constants as will lead to its identification.

Papers Presented at the Sixty-Second Annual Convention

THE BUGABOO OF COMMERCIALISM.*

HARRY B. MASON.

As this brief address was being written, the week preceding the convention, certain reform measures were under discussion with reference to the internal organization of the A. Ph. A. Now, as I am reading the address, these reforms are doubtless about to be taken up for final action. I speak of this reform movement for the reason that one of the suggestions advanced during the preliminary discussion of the subject has been that the commercial section should be abolished. Several ultra-professional members of the organization have had the temerity to advance such a proposition.

This affords me a text upon which to base a short sermon. It has several times been proposed to discard this commercial section, but the sound sense of the association as a whole has always set down heavily upon the idea—and always will. The very fact, however, that such a suggestion could be made at all is significant of a condition of things in pharmacy that has always been most unfortunate. It harks back to the time-honored attitude that the pharmacist is a scientific and professional man who should scorn all commercial considerations.

This notion has been a serious handicap to druggists. It has permeated the whole calling. It has leavened the whole mass. It has been preached in season and out of season by our idealists. It has been deeply instilled into the minds of every new class of pharmacy students. Year after year the same old fallacy has been perpetuated, and it is with exceeding slowness that we are coming to see the light.

As a matter of fact, all this scorn of commercialism in the drug business is the worst kind of stupidity. The old school pharmacist speaks yet of the "ethical" pharmacist and the "ethical" pharmacy, as if what he would call a commercial druggist and a commercial drug store was *unethical*. But ethics has nothing to do with the question. The word ethical in such company is a rank misnomer. The ethical law is the moral law—the law of honor and honesty—the law of square dealing—the law of rectitude and decency and integrity.

There is every bit as much ethics in honest commercialism as in honest professionalism, and a druggist who runs a soda fountain, providing he dispenses pure soda water, and indulges in no deception to the public, is just as "ethical" as the pharmacist who spends all his time in putting up prescriptions or performing urinalyses.

* Address of the Chairman of the Commercial Section of the A. Ph. A., read at the Detroit Meeting in August.

The sad and distressing feature of this whole tendency to canonize professionalism in pharmacy, and to bemoan commercialism, is that it has caused the practical failure of thousands of druggists, and has prevented the entire body of them from being as successful as they should have been. In making this statement I am indulging in no wild exaggeration. I am confining closely myself to the facts. For upwards of ten years now I have been making a close and systematic study of the pharmacist as a business man. For the most part I have found him wanting. I have discovered, for instance, that he usually has no idea at all of what it costs him to sell his goods or what his gross and net profits on them are. He is doing his business largely in the dark, and this is chiefly for the reason that he has been taught traditionally to have a fine scorn for business as something beneath him.

This whole attitude is so cruelly wrong—so diametrically opposite to the truth. Commercial skill and commercial occupation are not things to scorn. On the contrary, commercial ability is a far rarer flower than professional ability. You can go up and down the country and hire professional training of all sorts at a very low wage, but you can't find business skill enough to serve your purposes. It isn't to be had. It doesn't exist. There isn't enough of it to go around. Consider, for a minute, the large chain of drug stores in the eastern part of this country that is now endeavoring to increase the number of its establishments as rapidly as possible. What is holding it back—a sufficient number of crack prescriptionists? No, the woods are full of them. The one obstacle is that of finding a sufficient number of men who are competent to manage the new branch stores that the company expects and desires to establish.

What distinguishes this nation from all other nations? Isn't it commercial genius—the genius of the business creator that builds up vast commercial enterprises? Why are all of our leading universities establishing courses in commercial science? Why is a student who wants to prepare himself properly for the conduct of American business now urged to spend just as many years in university work as he would if he desired to study engineering or medicine or law or what not? Business, indeed, is just as much of a science as any of these, and the sooner this fact is realized by American druggists, the better it will be for them.

There is no disgrace in handling side-lines in a drug store. The man who sells souvenir post-cards is not headed straight for perdition. The pharmacist who makes a specialty of photographic supplies or optical goods or stationery should not be read out of the society of decent people. These things are all honorable—just as honorable as the dispensing of prescriptions. There isn't prescription business enough in the United States to keep its 47,000 druggists out of the poorhouse. The only course for the druggist is to do what has already been done—round out his sales by carrying allied things for which there is a public demand, and then study the art of salesmanship and the science of commerce so that he will make a success of the enterprise. And he should do it with his head in the air. His course is every bit as "ethical" as that of the purely prescription druggist, and he is just as good a citizen and may be just as skilled a man.

If I were disposed to make a plea on this occasion it would be for more instead of less business. I would have the American pharmacist become so skilful a business man that he would know how to take care of himself under any and all conditions. I would have him more self-reliant. As some new form of competition arose, or a particularly aggressive form of price-cutting developed, I would have him so independent that he would look to himself for protection instead of to any local or state or national organization. I would have him able to protect his own interests instead of waiting until a Stevens bill or some other law came to his relief.

Competition in the drug business, as in all other lines of trade, and in every profession, is steadily growing keener. It will be worse in the future than it has been in the past. Statisticians tell us that expenses are going up while profits are coming down. What is the lesson? It is this—that the pharmacist must become more and more of a business man, more and more a student of commercial practice, more and more a man determined to make the most of every honorable opportunity presented to him in the conduct of his store. He must study expenses. He must study profits. He must know precisely where he stands. He must be able to reduce his costs. He must be able to increase his selling figures. He must become a skilled advertiser. While not turning his back upon pure pharmacy, and while respecting to the uttermost his occupation and training as an apothecary, he must nevertheless reach out and make himself successful by the use of every commercial art that he can decently call into service.

Some timid souls may fear I am preaching a doctrine of heresy—that I am urging a course which means the destruction of all professionalism in pharmacy. Far from it. The able business man in our calling is the man who develops the purely professional aspects of his occupation just as shrewdly as he grasps every other opportunity and makes the most of it. He respects pure pharmacy because it is after all the foundation of his calling. But as a practical man he respects it still more because it contributes to his success. To prove this point without superfluous argument let me ask a question or two: Where do you find the largest, the best organized, the best equipped prescription departments? Where do you find men who do nothing all day long but dispense prescriptions, and who become specialists at the work? Isn't it in the big city stores where commercialism is pushed to the limit, and where the establishments have become so large and so successful as to make it possible to organize separate prescription departments, and conduct them as they should be conducted? Is there any lack of sympathy here between pharmacy and business—between profession and trade? Do they not lie down together in perfect harmony and does not one help the other?

In conclusion, I want to make one prediction. I have remarked on several occasions that our colleges of pharmacy do not pay sufficient attention to the subject of commercial training. I want to go farther and prophesy that 50 years from now, if not before, the typical school of pharmacy will be an entirely different institution from that of to-day. It will no longer give students the notion that the business side of pharmacy is beneath their consideration. It will frankly

recognize the pharmacist as a business man. It will follow the lead of the universities, with their elaborate commercial courses, and will devote one-half or two-thirds of its curriculum to commercial subjects. It will necessarily abandon many of the superfluous studies that are now deemed essential. In short, it will grapple with conditions as they actually exist, and it will make an earnest, studious and systematic effort to prepare the druggist for the intelligent and successful conduct of his business.

To state the case still more succinctly: The college now teaches its students the science of pharmacy. It will then teach them to run a drug store.

HOW TO GAIN GREATER EFFICIENCY AND CO-OPERATION FROM CLERKS IN DRUG STORES (AND, INCIDENTALLY, DUE APPRECIATION ON THE PART OF THE EMPLOYER).

CHARLES R. SHERMAN.

It has always seemed to me that the employer and employe should easily find common ground of mutuality of interest.

It is true, one gives his service and the other gives a money consideration for same, but if either has any faith in the ultimate triumph of the equities, it will tend to make the employe tender a full measure of prime quality service; while exactly the same motive, only originating at a different view-point, will tell the employer (individual or corporate) that, for the service he receives, he must inevitably, sooner or later, give a fair return.

How to secure faithful and efficient service in drug stores, is a most perplexing question. There are several reasons why this is so, and why this condition will not change, materially, until an entirely new status is recognized and agreed upon, as the basis for employing drug store help.

This *Status* is most essential for it relates to the actual work to be performed in most retail drug stores at the present time.

As to "ye ancient apothecary," the condition is little changed. We will presume and grant, that this type of a pharmacist knew his stock, and gave intelligent and adequate service to his limited number of patrons. The *personnel* of his store underwent metamorphosis in due time, by the employment of an apprentice, who was taught the "3 Rs" of Pharmacy, and who, in turn, became a "clerk," and, in time, (D. V.) he took the place, in part, and finally, in whole, of the proprietor.

Not one word will be said here, belittling this type of store, its proprietor or his assistants, but this sort of a drug store is becoming extinct. If men and boys could be found now to conduct this kind of a drug store, I believe the returns would be better than ever, but the measure of service was too great for the returns; too much of sustained effort and deprivation, too little of recreation and recompense.

The new drug store establishment, large or small, still needs and must have, (if it would retain the confidence of the public), careful, intelligent men and women, well skilled in the "Art of Pharmacy," for, let it be noted that this art

has *grown, under modern conditions*, instead of under-going "dry rot," as some would have us believe.

But, in the modern store, there will be many duties which may be performed, acceptably to all concerned, by one who has not "grown gray in the service," or by one enlisted for life.

When visiting the high-priced specialist, the patient, in most instances, is met by a very moderately paid young lady, who arranges the interview, and finally receives and records the fee, or makes an entry of charge, and thus, in very fact, performs the work which might otherwise have consumed exactly the same amount of the time of a skilled professional.

The important business statement, from the "chartered accountant," railway office, or bank, is extended, footed, and written by some faithful minor employe, who is entirely unchartered.

The public has finally been taught that there are thousands of minor duties that may be entrusted to unskilled, but clear-headed specially fitted employes, leaving the important essentials to those specially fitted to perform them.

To make the modern drug store attractive for the employe, hours must be shortened as much as possible and wages increased as much as the traffic will bear. The traffic, however, in the average good drug store, will never allow men drawing salaries of from \$75.00 to \$125.00 per month, and who are trained pharmacists, to spend their time in selling soda water, stationery, candy or cigars, or doing cashier's or bookkeeper's work. Each one of these things has its relative importance, but need not, *and should not* be done by one wearing the label of "Pharmacist."

In any store that does over \$10,000 per year business an untrained woman may well be employed at, possibly a commencing salary of \$20.00 or \$25.00 or \$30.00 per month, with an increase of \$1.00 per month for a stated number of months, or as long as her efficiency is increasing, and it will be found that there will be plenty of duties to fully occupy her time.

There are the show-cases to be dusted in the morning, cash and change and stamp fund to be counted and balanced, either morning or evening, new goods to be marked and arranged in and on show-cases, possibly assisting as label writer at the prescription counter during busy hours; indeed, there really seems to be no duty about the drug store that cannot be as readily learned by an intelligent young woman, as by the young boy or young man apprentice.

If the store is a larger one, and doing more business, the opportunity is enlarged for employing apprentice help, either young men or women. All this, with a view of conserving skilled and high-priced labor for the important service, which must be performed in every drug store every day, and also for the further and important purpose of dividing up the time of service so that more time off may be given all drug store employes. The long and weary watches of Sundays and holidays may thus be shortened, and yet acceptable service be given to the public.

In the larger city establishment, it is well known how these things are arranged. In such stores, two cashiers are generally employed, one commencing with the opening of the store in the morning, and working a reasonable shift of hours,

and being relieved later in the day by another young woman, who stays until the closing of the store in the evening.

It is customary, in most stores, to have the cigar case placed in proximity to the cash desk, so that cashiers may assist in the sale of cigars. Some portion of the minor office duties can well be performed by cashiers, such as addressing of circulars and perhaps the keeping of accounts of "petty cash" and stamp fund.

Indeed, close managerial care should be given, to the end that work is distributed along the lines of least resistance, to the end that each employe is given occupation suitable to his talents and experience, and his work thus made, in the highest degree productive.

The writer, who stoutly avers that he is neither a "moss-back" or a nihilist, as to the art of pharmacy, still believes the old-fashioned bottle-washing experience for boys starting the business, is the most wholesome path to follow at the beginning, and that the boy who has been inducted into the business-cleansing mortars and graduates, washing bottles, etc., thus, in due and proper time, becomes the best possible material for junior assistants at the prescription counter, or in the store.

This period of service need not be a long one, and will be calculated to impress the future pharmacist with the importance of these particular tasks; the fitness for future usefulness being rightfully forecasted by the faithfulness of performance of these minor duties. The length of this paper will not allow pointing out the absolutely important information which may be gained by the "boy at the sink," but no one, who has had this experience, or has had an opportunity of observing such apprenticeship, will question it.

Lest someone would interpret some of the things thus far suggested, as pointing toward the employment of cheap help, let me suggest that the result is just the opposite. By conserving the time of the trained pharmacist for the work for which he is fitted, his labor becomes more productive, and, of course, a better salary can be paid. The same is true of the skilled accountant, stenographer, or, indeed, anyone who has attained high efficiency in a given vocation. To allow such a person to waste their time in doing the work which would be done quite as well by one with a few weeks experience, is nothing more or less than business waste. If there is any place, more than another, where large department stores have employed sounder business methods than the "single liner," it has been in this particular. The skilled silk salesman is never seen behind the ribbon counter, and the woman who sells a "\$20.00 French Model" hat for 98c on Thursday afternoon, at the bargain square, need not be, and is not, an artistic designer of feminine head-gear.

When all the foregoing suggestions have been complied with, there still remains the all important thing of "personal equation," which goes to make up the successful career of the employe of small or great degree, in either small shop or large business establishment.

No one has ever disputed the saying that "the boy is father of the man," and it is equally true that the minor employe of to-day, if conditions are at all as they should be, must be the head man or employer of the business tomorrow. It has always seemed amazing to me, that even though youth, like love, is blind,

and must see things for itself before it will believe them, that this cannot be clearly seen, and that the straight road to success should not always be followed. The sign-posts to this road of success are always in plain sight. "Honesty," "Work" and "Steadfastness" seem to be the inscriptions which, alike, may guide each traveler along the business highway, to his particular goal.

Much is said and written, these days, as to "Salesmanship" and the "Art of Selling Goods" and "Bringing the Customer to the Salesman's View-Point"; all these feats being considered attainments, greatly to be desired in drug store, as well as other employes. Schools of Salesmanship have expatiated on these points at length, but, in the experience of the writer, such accomplishments, on the part of employes, are not nearly so necessary, or important, as the following of some of the simpler and pristine rules, as laid down by some much earlier writers, and lecturers; things that were said before most of the modern appurtenances of business were ever thought of, for instance, from the clerk's viewpoint: "Be ye not weary in well doing, for in time, ye shall reap, if ye faint not"; or "Thou hast been faithful over a few things, I will make thee ruler over many things."

From the standpoint of the proprietor and clerk alike an inspiration might be gained by remembering the words: "Seest thou a man diligent in his business, he shall stand before kings. He shall not stand before mean men."

In the experience of the writer, a scarcity has not been found of "scientific" or "would-be scientific" salesmen, but of salesmen and saleswomen who *know the goods carried in the store where they are employed*; who know the prices of these articles and the uses for which they are intended, and can find the goods and make the simple array of facts, as suggested, when the customer arrives, who is interested.

Simple enough, one would say, and yet, to ye who are searching after "human interest" data, I would say, try to buy a bottle of olive oil, some solution of silicate of sodium, a truss, an abdominal supporter, some rhinitis tablets, in the average drug store, and find out what you *do not find out* and how long it takes you to get this information, and when you have learned this, you will know why so many clerks are "sick of their jobs," and why, about the same number of proprietors are dissatisfied with the drug business.

The clerk who is ambitious to earn a good salary, and enjoy, along with it, good hours, must *learn his duties*, be they simple or complex. The manner in which the simplest transaction is handled in a store, indicates to that particular customer, the plane of the whole establishment, and the employe who lowers the standard by the shuffling, sloppy handling of a customer, helps to tear down, instead of build the business structure; to ravel, instead of knit, the commercial fabric.

In the drug business, as perhaps in no other line, continuity of service by both proprietor and clerk, is all important. The new drug store in the community, seldom reaps the best there is to be had of business, so, the new employe, even though quite competent, cannot hope to reap the full reward of his service, until years enough have elapsed to thoroughly establish him in the confidence of his employer and his patrons.

Intensified efficiency with elimination of waste, is what brings success to the factory, the large business establishment, and the small one as well, and exactly the same thing will bring corresponding rewards for the employe, for after all, any given business establishment, small or large, is but the replica, in few or great multiples, of the efforts of single units of employes. These units may be, to use a figure of speech, "half horse, or one thousand horse power," but if the function of each is performed with regularity, each contributes his share to the success of the whole, and it must follow that each will receive the rewards gained by all in proportion to respective share and value of service performed.

This paper might be made twice as long by pointing out the detail of work which should be performed in a given store by a given employe, for one day or one week, but as this work would not be the same in any two stores, no such array should be necessary, as surely any employe, who has his heart in the work, will know which near-lying duties should be performed from moment to moment, hour to hour, and day to day, as the weeks, months and years roll around.

It is not reciting an altruism, but the history of actual fact and experience, when it is said that the greater the avidity with which everyday tasks are taken up, the greater will be the success attending same, as well as the rewards attaching thereto. Concrete examples could easily be pointed out here, there and everywhere, showing just how great these rewards are and it is amazing that such instances escape the eyes of the half-hearted worker and fail to spur him on to his best efforts.

Just now, I have in mind as employes of a single retail firm, one young man who started at a salary of \$35.00 per month, and is now receiving in the neighborhood of \$2000 per year; another, starting at a salary of \$50.00 per month, and now has an annual salary of \$2300. With the same firm, also, is found a colored porter who has just about doubled his commencing salary, and a few young ladies who have doubled and tripled their commencing wages.

Of course the satisfaction enjoyed by the employer who has succeeded in retaining faithful and efficient helpers for a period of years, constitutes one of the joys of business, and when these reciprocal gains for both employer and employe, computed in dollars, confidence and good-will, are considered, one is more than ever impressed by the loss which both sustain, by a condition which might easily be remedied.

SYNTHETIC SUGAR.—A London chemist, Mr. A. Voltaire Boyes, has discovered a process for the production of a synthetic sugar at a cost considerably below the normal prices. It could be sold at something like 1½d. per lb., with a handsome profit. This new sugar is white, weight for weight as sweet as ordinary sugar, quite as soluble, and quite as wholesome. It is stated to be suitable for table and kitchen purposes and for the manufacture of jams, confectionery, mineral waters, etc. A company called the Synthetic Sugar Syndicate, Limited, has taken up the process, and will at once afford employment to five thousand men. The initial output will be about 100 tons a day.—(*Phar. Jour. (London)*).

Editorial

ERNEST C. MARSHALL, Acting Editor.....63 Clinton Building, Columbus, Ohio

THE COMMERCIALIZATION OF PHARMACY.

THE address of the late Chairman of the Commercial Section, which appears in this issue, should be read with interest by all the members interested in the proper growth of the retail drug trade of this country, and this will include, it may be said, every member of the Association, for, upon the correct and fitting development of the profession depends the welfare, not only of our Association, but that of nearly every one of its members.

What Mr. Mason says of the gradual development of the profession into a general business is interesting, coming from the source it does, from one who has been closely identified with the study of the business for years, but it seems to us that he magnifies the importance of the commercial side of the profession.

The corner-stone and the whole foundation of the profession of Pharmacy is scientific education. It is that education which gives the pharmacist his position in the world. It is that which, while not making him superior to his fellowmen, such as "the butcher, the baker and the candle-stick maker," yet causes him to be more respected in the community, as a man of superior education is always esteemed above those men whose only knowledge is of common things.

Far from any thought that any one class is better than another, yet it must be allowed that the respect of the community is rendered more to the man of technical training than it is to those the practice of whose business involves no special education or training.

No one will deny that contention of Mr. Mason that to sell postcards is as "ethical" as to prepare prescriptions, providing that the former is done in an honorable way, but will any one deny that the latter requires more skill, more training, more education than the former? It may be just as ethical to shine shoes, providing that the shoe-shining is done well and faithfully, as it is to make a perfect pill or a good tincture, but will Mr. Mason suggest, because of that, that the druggist should put in a shoe-shining department? The man at the barber's chair can be just as "ethical" as the man trained to that which will save life, alleviate pain, and relieve suffering mankind, but Mr. Mason would probably not contend for that reason,—because it is as moral,—that druggists should open ton-sorial departments.

"Let every cobbler stick to his last," is an old saying and a true one. Let druggists and apothecaries stick to the business of drugs, and not enter upon other fields with which they are unfamiliar and in which they are untrained. They can sell coffee and tea to be sure, but if they give their time to the study of the coffee and tea business they are neglecting the study of the goods which properly belong

to their profession, and no man can become expert in the trades of druggist and of grocer at one and the same time.

Granted that there is not prescription-business for all the 47,000 druggists of the country, are there not other things properly belonging to his profession for the druggist to do? Do not such things lie within the proper development of the opportunities knocking at his door? There are many unsolved problems of chemistry which he can take up and work out, without investigating questions belonging to a business foreign to him. The time he would devote to ascertaining the best coffee to purchase, the best source of supply for postal cards, can be well devoted to the study of questions relating to his own legitimate business, to becoming a master of the profession of Pharmacy. The tendency of the present day is to make the drugstore a department store, and for it to sell anything which can be sold profitably, and Mr. Mason thinks that that is the best way for the profession to develop. But with all those who have higher aspirations for the business or the profession of Pharmacy, we believe that the time is coming, and that it is close at hand, when these things which many think degrading and inimical to the true advancement of the profession of Pharmacy, will pass away and like the Phoenix, rising with enriched and renewed plumage from its ashes, Pharmacy will have a *renaissance* in which Pharmacy and Pharmacists will be again held in esteem, and in which Pharmacists will bear an ethical and honorable part.

The pendulum has swung too far to the side of the degradation of Pharmacy, and the backward swing must be just as far. Let us all labor to lift Pharmacy. Let its followers leave the lunch-counter to restaurants; the other parasitic growths to the businesses to which they properly belong, and let us strive to be Pharmacists in fact as well as in name.

It is not a question of ethics, of morals, but it is a question of expediency. Is it advisable to lower the *morale* of a profession because there is "a dollar in it?" If you answer that question in the affirmative you take all the nobility out of life, and make it simply a question of, How much lucre can I win? *Facilis est descensus Averni*, and from one step to another we may descend, justifying each lowering of the standards, because we justify our way as we proceed along the downward path.

Pharmacy has been led astray. Like the Jews of old, some of its people have set up a Golden Calf to worship and a Moses is needed to lead them back again to better, higher, if not more ethical practices.

E. C. MARSHALL.

THE JOURNAL OF THE
THE DETROIT COMMITTEE.

ITS ORGANIZATION, PLANS AND WORK.

IN order that a precedent may be established by which the efforts of the Local Committee may be recorded and made available to the succeeding committee, and in order moreover that the Association may be made familiar with the aims and purposes of the Local Committee, which has just finished its work, it has been deemed advisable to recapitulate what those aims and purposes were.

Aside from the ordinary routine of the Local Committee, the work of the outgoing committee was especially directed along two lines: First, that of conserving the time of the members present, and second, that of bringing promising material to the meeting with the end in view of familiarizing it with the workings and purposes of the A. Ph. A. and to secure such material for membership in our Association. To accomplish the first of these ends, it was *necessary* to use the whole morning and afternoon for work and *desirable* to leave the evenings all open for social intercourse. In order to have the morning and afternoon hours utilized, it was necessary to begin promptly at as early an hour as possible, which hour was decided to be 9:30, and to accomplish this, several things were necessary. First, the program must furnish no obstacles, second, the chairmen must be in their places at the appointed time, and third, the members must be assured that the meetings would be called and that they would not be kept in their seats waiting long after the appointed time. One of the greatest obstacles to the first of these propositions, was the custom of morning council meetings. The Council never did begin on time and always continued through half of the forenoon, and, including as it does, the chairmen of the sections, it was impossible under the old rule to utilize the morning hours. By holding the council meetings in the evenings this difficulty was obviated. To further expedite matters all the usual formalities of the opening session such as addresses of welcome and responses were eliminated. The second proposition was accomplished by enlisting the enthusiasm of the chairmen with the ideas of the committee, for which purpose, a special meeting of the chairmen was called the first day, at which they were made acquainted with plans of the committee and each individual chairman promised to call his meeting on time, authorizing his vice-chairman to do so if he should not be present. This meeting of the chairmen was a new departure and was a valuable aid to the committee in accomplishing what it desired toward the saving of time. The Local Committee recommends to the future committees the consideration of these meetings as a means of obtaining the co-operation of the chairmen. To accomplish the third end was not so very difficult. By paging the corridors of the hotel twice before every meeting, the members were made aware of what was going on. How the membership took to these plans might be illustrated by two occurrences. The Commercial Section on the first day was announced throughout the corridors according to the plan. According to his promise the chairman began his address with no audience save his secretary. The seats were soon filled, however, when the members saw the section to be in session. By Thursday, when the river excursion took place the departure of the boat was also announced through the corridors of the hotel.

By this time the membership had caught the spirit of the meeting and when the boat had left the dock exactly on schedule, the members of the Local Committee, who remained at the dock to direct any late comers, had nothing to do. Everybody was on the boat. The inconvenience which might attend the holding of simultaneous sessions rendered necessary if the evenings were to be open for recreation, was to a large degree obviated by bulletins announcing what was going on in every section that was in session. The bulletin scheme, which was somewhat of an experiment, may be made much more successful at the next meeting if profit is made by this year's experience. If a collective program is published as directed by the council so that each member will have in his possession a complete program and if in printing the program, the Local Committee provides that all the items on the *program are numbered* so that the numbers can be announced on the bulletins by a large figure instead of by title, there will be little or no confusion in the bulletin scheme.

When so many sessions are being held at the same time in different rooms, as is the case in the A. Ph. A. Conventions, some confusion is apt to occur. The Local Committee endeavored to minimize the confusion which would naturally follow by having the different sessions of any particular section, conference, association, or council meeting meet in the same room. A large card was placed at the entrance of each room designating it as A, B, C, etc. Smaller cards were provided with the words "Council," "General Session," and names of the various sections, etc. The appropriate card was then attached to the larger cards, thus indicating what meetings were going on in the various rooms at any time.

To bring about the second main result, that of bringing available material for membership to the meeting so that the object and workings of the Association could be demonstrated, the following means were employed. First, the usual publicity in national Journals, second, the holding of joint meetings of the State Association with our Association, and third, the assistance of Travelling men throughout the state.

The first of these need not be commented upon for although the national campaign was conducted with unusual skill and vigor, it was a means that is usually employed.

The second one was undertaken with a less degree of confidence or sanction by custom, but we believe our reasons for trying it sound, and results were profitable. It cannot be denied that there is almost a universal misunderstanding by druggists of the character and work of the A. Ph. A. The impression is general that it is an organization of "high brows" and that there is no place in it for the retailer.

A second proposition is also a fact, namely that the material to which our Association must look for recruits is to be found among the individuals who make up the State Association, that is, a man who is likely to be appealed to by an association, is likely to be in his State Association.

For these two reasons: that of getting the people who are in sympathy with our work and that of correcting the wrong impression of our Association in their minds, we decided to hold our State Meeting jointly with the A. Ph. A. We believe the action was wise. The writer took pains to make many inquiries among state members and in almost every instance, they not only enjoyed the meeting immensely, but were impressed with the democratic spirit of our Asso-

ciation, and whether they joined at once or not, they will at any rate not be kept from joining through their former misconception which we all know to be a general one.

The program was so arranged that the state meetings did not interfere with the A. Ph. A. at all. Two short general sessions of the State Association were sufficient for the transaction of its business. Besides this, there was one joint session with the section of Practical Pharmacy and Dispensing, at which was demonstrated the educational side of our work, and one joint session with the Commercial Section which emphasizes the interest of our Association in the commercial efforts of the retail druggists. This constituted the official program of the State Association, although of course, the state members mingled with the association members at other sessions.

In the work of publicity throughout the state, the Commercial Travellers Organization of our state were of material assistance throughout the nine months preceding the meeting.

Concerning the organization of the committee something might be said. The same general plan was employed as was utilized at the Nashville Convention. That is the committee was divided into suitable sub-committees whose chairmen constituted the Executive Committee.

Members of the General Committee were selected either on account of their prominence in local pharmaceutical circles or on account of their special fitness for the work in hand. For obvious reasons the chairmen of the various sub-committees and the resulting executive committee were selected altogether from the latter class. By this arrangement it was necessary to call the General Committee on only two or three occasions to receive reports of progress from the Executive Committee, which met every week for the last two or three months prior to the convention.

It is with full realization of many short comings in the conduct of the past meeting that the Committee makes this report, but it is in the hope that progress may result; that meetings may become more efficient, and that the work of the future Local Committees may constantly approach nearer perfection by the making of such a report by this and succeeding committees for the benefit of their successors.

L. A. SELTZER.

CHRYSAROBIN IN PSORIASIS.

In an article entitled "Summary of Research Studies in Psoriasis" the authors state that "Chrysarobin, the most powerful and efficacious drug known in psoriasis, has practically no germicidal power; calomel, on the other hand, which we have found to be highly germicidal and capable of destroying the cocci in the skin, has but a feeble effect on the patches of psoriasis."—J. F. Schamberg, A. J. Renger, G. W. Raiziss, and J. A. Kolmer (*Jour. Amer. Med. Assoc.*, August 29, 1914).

•

GEORGE HENRY SCHAFER

Honorary President, American Pharmaceutical Association, 1914-1915.

Mr. Schafer was born at Ft. Madison, Iowa, July 15, 1847. He was educated in the public schools and academy of his native city, and rounded out that education at the Western Union College and Military Academy at Fulton, Illinois. He entered the profession of Pharmacy in 1862, at Ft. Madison, under the tutelage of the firm of McFarland & Eckhart.

In 1868, Mr. Schafer became a member of the firm with which he had formerly been employed, and in 1872 he became the head of the present firm of George H. Schafer & Co., his son, Mr. Robert Schafer, being the other member of the firm.

Mr. Schafer became a member of the A. Ph. A. in 1871. In 1880 he was elected First Vice-President, and at the request of the President, Mr. James T. Shinn, who was unable to be present, he acted as President at the meeting in Kansas City, in 1881.

In connection with this meeting, it is interesting to note that it was probably the cause of the extension of the Atchison, Topeka and Santa Fe Railroad from Kansas City to Chicago by way of Ft. Madison, and the consequent great development of this Section of the West.

The first suggestion in regard to this extension occurred in August, 1881. Mr. Schafer, upon arriving at Kansas City a few days before the annual meeting of the American Pharmaceutical Association, at which he presided, found that three railroads to the Rocky Mountains had united on a rate twenty times that of an excursion rate which the western delegation of pharmacists had promised the preceding

annual meeting at Saratoga, N. Y., as an inducement to hold their succeeding annual meeting in Kansas City. Mr. Schafer at once wired the Santa Fe officials at Topeka to get the presidents of the several roads to redeem their promises to incoming delegates from all parts of the U. S. and Canada, keeping the wires hot for several days. It resulted in Mr. Strong, General Manager Wheeler and Traffic Manager White meeting Mr. Schafer at Kansas City and consenting to redeem the pledges made to western delegates at Saratoga by making the special rate of \$1.00 to the Rocky Mountains for all delegates attending the Kansas City meeting. This happy conclusion and Mr. Strong's good heartedness encouraged Mr. Schafer to then ask Mr. Strong and the officials present why the great A. T. & S. F. Ry. did not extend their lines from Kansas City to Chicago. While no direct answer was made, Mr. Strong began propounding such interesting questions to Mr. Schafer and the attending officials, that upon Mr. Schafer's return to Ft. Madison he took the matter up with some of the leading citizens and a public meeting was called. The result of this agitation was that the extension of the road was decided upon. He served also as a member of the Committee on National Formulary from 1888-1894, and a member U. S. Pharmacopoeial Convention of 1890.

A brief sketch of his activities in Iowa Pharmaceutical affairs may be summarized as follows: Author of the Iowa Pharmacy Law of 1880, first drafted and submitted to the Legislature of 1878, which was considered of such force and state-wide effect as to be taken as a precedent for modern pharmacy legislation, since enacted in 32 states of the Union, especially so as the draft for this law received the enthusiastic support of the Iowa State Pharmaceutical Association organized at Des Moines, February 10-11, 1880, with Mr. Schafer as its first President. Upon the enactment of this law March 22, 1880, he was appointed one of the Commissioners of Pharmacy for the State of Iowa, serving from 1880 to 1888, during which crucial period his original draft, initiative administrative regulations, amendments, etc., were subjected to many contests in the State, Legislature and Courts by which the fundamental principles of modern pharmacy laws were fully sustained, notwithstanding the important innovations on statutory laws they were and are held as constitutional and for the public welfare.

He was elected Honorary President of the American Pharmaceutical Association, and Honorary Member of the National Boards of Pharmacy at Detroit, August, 1914.

Contributed and Selected

COLORIMETRIC METHODS.*

FREDERIC E. NIECE, NEW YORK CITY.

In bringing this subject before you at this time, I do so with one object in view and that is, to give the work the prominence it deserves, and mention the study it will require before it will reach a point of perfection, necessary to make it of general usefulness to our laboratory workers, especially our pharmaceutical chemists. No attempt will be made to explain in detail the various methods that have been found to possess reliable means of a determinative nature, but briefly to call your attention to a few, and incidentally mention their virtues over older methods, with such references as will give leading information should anyone desire to consult more fully the methods in question. The actual work that has been performed involving the principle of color measuring is meager, considering what has been accomplished in the interest of other methods of an analytical nature. That the principle here involved is not a new one needs no comment, but like most all things of simplicity, it is too common-place to be considered of much value. In contradiction to this mis-conception however, we will find in the question of a water analysis, an argument strongly in favor of a more careful study of this line of technic, for as a matter of fact, a water examination to be of any value will depend, for its completion, upon the principles concerned in colorimetric determinations, for if this were not true, or impossible, water examinations as a possibility would a long time ago cease to be a factor in matters pertaining to the chemist.

In viewing the literature on this subject, from a most varied and scattered field, I find mentioned here and there certain methods which when slightly modified from the original, reach closely a mark nigh unto perfection, for the purposes they have been offered. I find in particular, no limit to the uses to which color measuring has been applied in pharmaceutical practice, and there seems to be no limit to its applicability in general chemical analyses as well. As an innovation to our busy pharmacists and chemists, a set of reliable standard colorimetric methods would fill a well deserved place in the analytical laboratory, by reason of their use in preference to the more tedious, elaborate and time consuming methods of volumetric, gravimetric and electrolytic operations. A selected set of standard methods would be of the greatest value, if so arranged as to be easy of application without the sacrifice of accuracy. In reviewing the work thus far done, I did not locate any book in English, exclusively devoted to this subject, but I did encounter some few references to a German work, and some as to a French book, but this was all. The only treatise I know of as being of American

* Paper submitted to the Saratoga meeting of the New York State Pharmaceutical Association, June, 1914.

origin and dealing principally with this line of analytical procedure, is bulletin No. 31 issued from the Bureau of Soils, of the Department of Agriculture. This was published in 1906. The methods mentioned in this work, are intended solely for soil work or analysis, but I have succeeded in using the same methods with slight modifications, in many other directions, and they have given very reliable results.

What a revelation would greet pharmacists, if much of this delicate weighing could be done away with by measuring depth of color in its stead, and thus determine the quantity of substances present. I venture to state, that the time is not far hence when much of this will be disposed of especially in our pharmacal laboratories, by virtue of the establishment of a number of reliable colorimetric methods. Not that all things will be possible by this means, but many things now

A—Movable mirror. B—Reflection of colors in tubes. C—Upper frame work-movable. D—Fifty cc. Nesler tubes. E—Thumb screw for adjusting upper movable frame work. F—Tube support with holes. G—Upright supports (rigid). H—Glass shelf tube rest. I—White opaque glass light reflector. J—Base for stand. K—Screw hinge.

analysable by no other way than by older methods, may yet be determined by color, either preformed or created.

Color analysis is more simple and in many instances more reliable than either weighing or measuring direct. There are times; and many things do exist, whereby no other method is applicable other than that of color comparison.

In order that we may better realize the scope of this line of analytical procedure, I am going to briefly mention a few methods selected at random that have peculiar virtues all their own for determining substances, colorimetrically, and some others not so readily estimated by other means than this, with results

exceedingly accurate, considering care in technic. To go into greater length in describing these methods, would be unwise at this time since the discussion of one method alone would be sufficient material to form the basis of a paper in itself.

My sole intentions at this time are to bring the subject matter to you in such a manner, that you will become acquainted with the importance of its study, and thereby better realize the neglect it apparently has suffered.

I also desire to present to your notice a simple piece of apparatus, which I call for want of a better name "A Colorimeter." This instrument can be readily constructed, and such as it is serves every requirement, for it is inexpensive and less complicated than the more costly ones. [See p. 1461.]

In my laboratory it has left nothing to be desired, simple as it may appear, and setting aside faulty technic, it will by no means interfere with any attempt at accuracy, for there is nothing to get out of order, as to mislead vision.

A word as to technic. We must realize in this work as well as in all analytic operations, accurate results depend entirely on care and precision, hence each little mis-step multiplies itself to the end, for in this work we are dealing with minute quantities. In defining colorimetric analyses, we would consider it as a quantitative procedure, by estimating the color depths of two solutions, containing colored compounds in solution or colloidal suspension, which is usually performed by comparing columns of tinted fluids in suitable apparatuses. The comparison being made after striking a similar tint with the known or standard solution to that of the unknown solution. By a series of dilutions with water or other fluids indicated, the colors are then matched and from this the amount of substance (according to its color) is ascertained in the unknown solution and finally the sample itself.

The manner by which the color matching can be accomplished is by diluting with appropriate diluents, standard color solutions until the color so made compares exactly with the color of fluid under investigation, or by diluting the sample color itself until it reaches the color of the standard, or by varying the depth of the volume of the standard solution in a suitable graduated tube until it agrees with the color of the material under testing. Or in a like manner both volumes can be so adjusted, as to compare by the addition or removal of measured amounts until the colors agree when a simple calculation gives the data sought. In either case the work is simple.

In order that we may better comprehend the wide range of usefulness this principle can be applied to, the following will give a few representative examples covering as you will observe almost every domain of analytical manipulation. A few are as follows:

The determination of citral in lemon oil and lemon extracts by the use of meta-phenylene-diamin hydrochloride.

The estimation of the amount of albumose in anthrax cultures by precipitating the same with absolute alcohol.

The valuation of vanilla extracts, by determining the amount of vanillin, by using iron sulphate.

The estimation of salicylic acid in food products by the use of ammonio-ferric-alum.

The well known method of determining the amount of carbon in Bessemer steel, using Bessemer steel standards in acid solution.

The valuation of cudbear and caramel in solution are procedures well known to pharmacists.

The estimation of free lactic acid in stomach contents by using ferric chloride in hydrochloric acid to form the lactate of iron.

The estimation of hemoglobin in blood by the Gower method as modified by Sahli, using as a standard picrate of carmin in glycerine.

The determination of adrenalin in supra-renal glands, by using as a comparative standard, pyrocatechin and ferric chloride.

The sanitary examination of contaminated water supplies for the presence of lead, using a saturated solution of hydrogen sulphide.

The determination of very small amounts of strychnin in human viscera, for medico-legal purposes, using as a reagent to produce a characteristic color; sulphuric acid and sodium iodate.

The very reliable method of the Bureau of Standards for the precise determination of iron in solution by using sulphocyanic acid.

The well established method of Schreiner and Brown for the exact estimation of phosphates in soil by using magnesium mixture and ammonium molybdate.

In conclusion, I may state, that I have but only scratched the surface of the vast possibilities that remain open for research in this old, but disregarded field of analytic work. I make no claim for superiority over those of the older and well defined methods extant to-day, but I do feel, that there will be occasions when the older methods will be inadmissible, and therefore in such an event, we should have recourse to other means for an accurate determination of the substance under investigation. In view of that, a number of methods known to be of value by reason of their more general use, would be acceptable. In that direction colorimetric determinations would then fill a very important part in our daily routine.

A STUDY OF THE WORK DONE BY THE COMMITTEE ON PHARMACY AND QUERIES OF THE VARIOUS STATE PHARMACEUTICAL ASSOCIATIONS.*

BY FREDERIC E. NIECE, NEW YORK CITY.

In the beginning of this study I was amazed, on investigating, to find a condition of apathy, much beyond my expectation. I was quite aware that conditions were not as they should be, for the conspicuous laxity or otherwise dis-interest in the welfare of this most important committee, as was manifested to me through the different channels I pursued, proved to be more serious in the end, than what I had any reason to anticipate at the beginning.

In this study as taken from various sources, three salient factors presented themselves to me as being the cause for this much neglected department of our state pharmaceutical associations.

First. The evident disregard by the majority of the members for this part of the annual proceedings.

Second. A seeming dis-interest towards the work or results of this particular committee.

* Read at the Saratoga Meeting of the N. Y. State Pharmaceutical Association, June 23-26, 1914.

Third. The poor attendance at the committee's session—if they have one—and the extreme dearth of papers.

A committee of this nature certainly has some function to perform, and by reason of this fact, has some prescribed duties to exact.

Now, if this be true, and there seems to be no reason for questioning the statement, let us determine just what are the duties of such a constituted committee. For the sake of argument, let us take our own case and turn to a copy of our proceedings and read the By-Laws, under the caption of "Appointment of Committees," Art. VII, Section 3:—

"The Committee on Pharmacy and Queries shall during the interval between its appointment and the next ensuing meeting prepare a list of queries and suggestions on scientific and commercial topics and shall at least two months before the date of said meeting send a copy of this list to each of a selected number of members and the committee shall report its endeavors at the said annual meeting."

From this we are to understand therefor, that such a committee has much laid out for it to do, and the terms of its labors are given in precise wording. But with all this, the committee becomes a nonentity by reason of the failure of the membership at large to coöperate with it.

The intent of this report is by no means a complaint, but rather a request for better work in the future, not so much by the committee itself, but by that vast number which constitutes the committee of the whole—and that is the entire membership. I have no reason for admonishing past or present committees, either directly or by inference, but I am endeavoring to awaken more interest in the welfare of this committee, than what has been manifested at previous meetings of recent years. The members comprising this committee, of each year, to my knowledge have made every effort to succeed with their work, but the weak support they have received from the members in general has been decidedly discouraging.

What is seriously needed, is some plan of activity that will create more enthusiasm and greater interest in the welfare of future committees if their appointment is going to be justified. How this may be accomplished, will perhaps depend on the manner in which the committee—from year to year—bring it to the notice of the membership. Two cardinal points suggest themselves however—which have proven successful with other associations less pretentious than our own. One way is by setting aside an entire session in the morning or evening for reading and discussing papers only. The other is the awarding of suitable prizes under certain conditions, for meritorious papers. The details of this being left within the jurisdiction of said committee. Certain rules should be set down however, so as to insure the program being carried out in order. These rules should be strictly adhered to. I find the usual complaint (and it is prevalent) of authors is by statement—"that you get no time to read a paper, and then if you do read it, there is hardly any body present to listen or discuss it." Rather a poor stimulus for our members to write papers isn't it? That every workman is worthy of some reward, goes without saying, hence no writer, ever so humble wants disappointment in the reading of his or her creation, especially after they have taken the pains and suffered the same in burning the mid-night oil in arranging their thoughts in a tangible form.

The arguments here submitted are in consequence of reliable data which I have collected from various sources. It is offered at this time, and in this manner, with the hope that this committee will be more readily recognized as a factor in our state associations, and a virtue of no small value at our stated meetings.

The prime objects of our annual meetings, as you well know, are to disseminate knowledge and good cheer. A careful examination will reveal however, that things are very much one sided, for as a matter of fact, the latter will be found to be 90% to the good, while a bare 10% can be figured out to the credit of the former.

The annual gathering is the one occasion of the year that we all look forward to for recreation and freedom of all commercial cares and scientific pursuit.

To meet with it, means the coming in contact with those elements conducive to a more congenial sphere by reason of new scenes, strange faces and happier environments. This is the one thing uppermost in our minds, and well it is reasoned, but where will one find a more opportune time for education and elevation, than at a meeting of this kind, where many minds from as many different places congregate to delineate upon the topics of the day. On all occasions there is a time and place for everything, but so sad to state, the fate of this committee of late, has been such, that it has had no place to lay its weary head, much less to even speak its own name.

How true this is, may be better understood, by the reading of the minutes of our various state associations, when an amazing condition of affairs will present themselves.

You will observe that there is no attempt to over-burden the attendants with an abundance of knowledge, good, bad or indifferent as the case may be, and yet the purport is in that direction; while there is no lack of other things. Now let us see if this is a fact, or only idle conjecture. The following list of questions was submitted to the secretaries of all the state pharmaceutical associations throughout the United States. The following replies taken at random and placed in their numerical position as to membership furnished this interesting information:

	Membership 1913	Members present last meeting	Papers presented	Special ses- sion for read- ing papers	Percent of pa- pers to mem- bers present	Percent of pa- pers to entire membership.
Pennsylvania	1415	96	38	yes	40	2.6
New York	1160	150	3	no	2	0.2
New Jersey	900	110	16	yes	15	1.7
Wisconsin	451	85	20	no	23	4.4
Tennessee	450	175	10	—	6	2.2
West Virginia	415	130	3	no	2.5	0.7
Virginia	410	105	3	yes	3	2.0
Alabama	400	75	4	yes	3	1.0
Washington	320	100	6	no	6	2.0

An examination of the above figures shows the following results:

Out of the nine associations selected, with a total membership of nearly 6000,

a total of 926 members in attendance is found according to the records of the last year. This gives 15% of the total. Out of this number something like 108 papers were obtained, giving a percentage of 1.8% out of the entire membership. This adds to our fund of information one paper to about every 55 members or about one paper to every nine members in attendance, or an average of 12 papers to each association recorded. The percentage of individual papers presented per association as compared to the members present at the meeting of their respective association, show a great variation. Pennsylvania is the highest; with 40%, and New York the lowest; with 2%.

It is quite evident, that these facts prove the contention, for one can see that there is a sorrowful lack of interest all along the line.

In support of the statement, that the dissemination of knowledge is one, if not the all important feature of our state meetings, I should, in passing, refer you to our national association, or that of the American Medical. It seems the only matter of importance that comes before these bodies other than that of legislation, is that of education, be it scientific or commercial. So I say, our various pharmaceutical associations should be adjudged in neglect. This much talked of "Professional Pharmacy" can be no better fostered than by reason of the production of a fair quantity, and a good quality of original material for reading and discussion. In view of this, and it should not be difficult, the annual meetings could not avoid becoming of interest to every one and thereby truly scientific. That scientific touch, that so many of us desire that our meetings should possess, will no longer obtain, unless we show a greater interest in the welfare of this particular committee, for by no other channel can it become possible other than this one; at least not so readily.

If we are to expect a continuation of such a committee, if we are to advance the interest of our profession, if we are to gain in strength, knowledge and prestige, we must show more willingness to coöperate and assist this committee in its work. By reason of the success of this committee's work, many, if not all of us, will doubtless return home much richer in the world's knowledge of our chosen profession, than when we came.

AMYL NITRITE; ITS PREPARATION, PURITY AND TESTS.

FRANK O. TAYLOR, PH. C.

(Continued from September Number.)

The B. P. says: "A mixture of 5 volumes with sufficient alcohol (90%) to form 100 volumes affords a liquid of which a portion tested in a nitrometer, as described under "Spiritus Aetheris Nitrosi," should yield not less than six times its bulk of nitric oxide gas." This is equivalent to about 66 percent. by weight of pure amyl nitrite. This also is a standard easy of attainment, in fact it is decidedly too low. A sample which will meet the distillation test will more than respond to this assay.

Again, the U. S. P. imposes an assay requiring about 80% of pure amyl nitrite. This is not at all too high but of itself would readily pass a sample as of standard quality which might be far from such. If amyl nitrite has been imperfectly made from an impure alcohol, it might easily contain lower alkyl nitrites and un-

changed amyl alcohol. These lower nitrites have a specific gravity differing little or not at all from that of amyl nitrite and for equal weights or volumes containing much more of the nitrite radicle. For example 0.179 grammes of nitrite gives 30 cc. of nitric oxide gas at normal temperature and pressure. If this is assumed to be amyl nitrite it is equivalent to 87.2 percent. by weight of the pure ester. If instead it be propyl nitrite the percentage is 66.3, a difference of nearly 21 percent. It is not our intention to enter into any discussion of the various assay methods proposed for amyl nitrite, as this has been very thoroughly discussed. So we shall simply refer to some of the more important articles on the subject, viz.: Allen, Pharm. Jour. (3) 16, 442; Curtman, Proc. A. Ph. A., 1892, 159; Smith, Am. Jour. Pharm., 1898, 273; and Fisher and Anderson, Pharm. Arch., 1898, 189.

Practically all the published examinations of commercial amyl nitrite have consisted simply of determinations of specific gravity, boiling point and the use of a fractional distillation or assay alone; seldom both together. It is perfectly true that these are the only methods we can apply for quantitative valuation of amyl nitrite but it is equally true that neither one alone is capable of always giving reliable results. While fractionation and nitrite assay have been used together, the proper relationship which should exist between them in medicinally acceptable amyl nitrite has not been carefully considered. From using both fractional and gasometric assay in commercial work we find that an excellent idea of the value and purity of amyl nitrite can be obtained by the use of both together where either one alone may lead to erroneous conclusions.

The writer's experimental work was not in any way an investigation in pure chemistry for this aspect of the subject has been dealt with at length and carefully by others, but is to be considered wholly from the standpoint of commercial and pharmaceutical work and hence no special refinements of assay or distillation methods have been used.

The customary form of nitrometer was used and, as the general application of the assay is always the same, details are omitted, being given at length in many other places. Correction of the gas volume was made for temperature only. This correction is necessary because as compared to the total volume it is at ordinary temperature, large, and may easily be applied. The correction for barometric pressure is by no means so large at low altitudes and average conditions of weather and is hardly necessary for all essential purposes of the assay and, though the U. S. P. specifies such correction, it will usually be omitted by pharmacists from lack of reliable means of determining the pressure, except in the higher altitudes where the correction is important. The application of a correction for vapor-tension of the liquid in the nitrometer is not to be thought of for ordinary pharmaceutical work, especially as it is more or less completely compensated by the solubility of the nitric oxide in the saline solution of the nitrometer. For calculation of such details see Brandel: Pharm. Review, 1904, 273 and 445, and Lyon: *ibid.* 440.

Distillations, almost without exception, were carried on in ordinary side-neck distilling flasks of 250 cc. to 300 cc. capacity, having a neck of 20 mm. internal diameter and about 70 mm. long up to the side-neck. The mercury column of the thermometer used was wholly immersed in the vapor when possible; other-

wise proper correction was made for exposed mercury column. Delicate still-heads or fractionating columns were intentionally avoided in the effort to have conditions such as might be expected in ordinary pharmaceutical testing. In some cases a small Würtz-tube with two bulbs and side neck was used in connection with a round-bottomed flask without side neck and of the same capacity as the side-neck flasks.

EXPERIMENTAL WORK.

To begin with, samples from six different manufacturers were examined with results which are recorded at length in table I and in more condensed form in table II.

TABLE I.

	1	2	3	4	5	6
Assay	87.5%	86.6%	96.1%	65.3%	91.9%	1.1%

DISTILLATION.

The amount opposite any temperature is that which distilled between that temperature and the temperature of the next preceding entry in the same column.

Above 100°	70.5	12.5	13.0	41.0	5.0	78.5

NOTE:—In all distillations in this paper there is a certain amount of loss not taken into account so the distillate and residue will not total 100%.

The table scarcely requires comment. No better evidence of the tremendous difference in quality of commercial amyl nitrite could be desired than a comparison of 5 and 6; one the best, the other the worst found on the market; both from

reputable manufacturers and, while 6 is 40 cents per pound cheaper it is in reality worth absolutely nothing. The futility of such a compound in the severe paroxysms of angina pectoris renders its use a danger instead of a source of safety. Number 5 is, on the other hand, an excellent example of what a first-class amyl nitrite should be. Nothing better need be asked for all therapeutic work.

With 91.9 per cent. of amyl nitrite by assay, nearly 12 per cent. in excess of the U. S. P. requirements, 95 per cent. distilling between 90° and 100° or 25 per cent. better than the B. P. standard, and 78.5 per cent. between 94° and 98° , we have proof of the quality that can be offered for sale at a price by no means excessive. That 18 per cent. of 6 distills between 90° and 100° where only 1.1 per cent. is shown by assay is accounted for by the fact shown by Young and Fortey (*Jour. Chem. Soc.*, 1902, 734) that a binary mixture of amyl alcohol and water distills constantly at 95.15° . The influence of the small amount of amyl nitrite present, together with the water, so lowers the distilling temperature that this unexpectedly large quantity of distillate is collected at 90° - 100° . This is a good instance of the impossibility of judging amyl nitrite by the fractional distillation alone, for knowing the assay and fractionation of 1 and 4 we would say that 6 ought to contain about 40 per cent. amyl nitrite. It consists chiefly of unchanged amyl alcohol and it is hard to conceive by what crude process it was made or how it was permitted to go on the market.

The remarkably large quantity distilling below 90° in 2, 3 and 4 is good evidence of the presence of lower homologous nitrites. The distillate above 100° in 2 and 3 shows that the most of the alcohol was converted to nitrite, but the large low boiling portion shows the impurity of that alcohol. An assay of 96.1 per cent. would lead us to think we had obtained a most excellent product, even better than 5, but it is really far inferior. Next to 6, 4 is the worst of this lot as it was evidently made from a poorly rectified alcohol and much of the true amyl alcohol remained unacted upon. The assay figures further confirm this conclusion. The fallacy of the assay alone is well shown by table I. Four of the six samples are well above U. S. P. standard of assay, but only one of these is worthy of recognition as a first-class product.

The quality of 6 was so poor that it seemed surely to be through some mistake that it was found on the market and so four months later six samples were obtained in order to again test them to see if the product of these same houses was fairly constant in its quality. The intervening time would probably be sufficient to change the market so that new lots of goods would be tested.

The fractional distillations were made very carefully especially below 90° , where table I was deficient. Also examinations were made for acidity, aldehyde and nitrites.

Acidity is expressed as cc. of N/1 alkali to neutralize 5 cc. of amyl nitrite, the U. S. P. limit being 1 cc.

Aldehyde was tested for by the U. S. P. test.

Nitrates were tested for by the destruction of nitrites by urea and dilute sulphuric acid and their subsequent detection by zinc and iodo-starch paste.

The results are appended in tables III and IV.

TABLE III.

Water	2.5	None	0.5	Trace	Trace	Trace

Of the six sources here represented number 11 was not included in Table I and 1 of Table I is not in Table III, while of the remainder 2 and 8, 3 and 10, 4 and 9, 5 and 12, and 6 and 7 are of the same manufacture.

Number 7 shows improvement over 6, but is still so bad that it is practically worthless. The assay shows much better and the extremely small quantity distilling between 90° and 100° is due to the low boiling point of an amyl nitrite-water mixture. As before, this sample is crudely made and neither distilled nor dried.

Number 12 is not so good as number 5 but is still of a high standard and well beyond any pharmacopœial requirements.

Next to 12 may be classed 10 which is of by no means bad quality, tho not meeting the B. P. distillation test. It had evidently been made with some care from good alcohol and been purified by washing and drying tho not by distillation.

The distillate below 70° in number 11 shows the use of an alcohol not sufficiently rectified to remove all lower boiling homologues. This is still more the case with 8, which gives 4 per cent. of distillate below 70° and 0.5 per cent. below 60°. The exact point at which this distillation began is not known as the thermometer used did not register lower than 57° and several drops of distillate were collected before that temperature was reached. This sample contained no perceptible quantity of water so the low boiling portion is evidently due to small amounts of propyl and butyl alcohol present in the amyl alcohol used.

Number 9 showed 0.5 per cent. of water present but that will not account for the amount boiling below 90°; so here also lower nitrites are present, as well as unchanged amyl alcohol. Its acidity is also beyond the U. S. P. limit.

In the cases of 7, 8, 9 and 11 the portion which does not distil below 135° proves the presence of high boiling compounds produced from amyl alcohol or its impurities and may be due to nitropentane (boiling between 150° and 160°); but, as will be seen later, it contains other substances of still higher boiling points.

The first few drops of distillate in 8 and 9 gave an odor suggestive of hydrocyanic acid but the Prussian Blue test did not prove its presence.

Number 8 is also an example of the necessity of a distillation test. By assay it shows 80 per cent. amyl nitrite or just the U. S. P. limit, but the fractionation proves that it is far from being as good as this would make it seem.

An interesting and unexpected fact is found in the lowering of the acidity in every case after distillation. It was expected that the acidity would increase after distillation through decomposition, this very thing being given by D. B. Dott (Pharm. Jour. (3) 10, 231) as proof that amyl nitrite decomposes during distillation, but the reverse occurred by the expulsion of a volatile acid, presumably dissolved nitrous anhydride. Taking the twelve samples into consideration, representing seven manufacturers, 5 and 12 are excellent; 10 is fairly good; 1, 2, 3, 8 and 11 are only fair; 4 and 9 are poor; 7 is very poor and 6 cannot be classed as amyl nitrite. What is the cause of this very poor exhibit? Is it so difficult to make an amyl nitrite of first quality or is it due to careless methods? To obtain some definite information on this point small quantities of amyl nitrite were made (by the nitrous acid process) from different grades of alcohol with various changes in the details of production, using always methods and apparatus which have been used on a manufacturing scale.

The first care was to obtain an alcohol of suitable quality. Three lots were obtained and tested for specific gravity, boiling point and optical rotation, with results as shown in the following Table V. Number 1 was said to be an alcohol distilling between 125° and 132°. Number 2 purported to be a very pure, reagent amyl alcohol. Its specific gravity of 0.814 confirmed this but two perfectly agreeing distillations gave condemning results. Number 3 marked "Pure" and said to distil between 128° and 130° proved to be of excellent quality.

TABLE V.

	1	2	3
Specific Gravity	0.816	0.814	0.818
Optical Rotation (100 mm. tube)	1° 00'	0° 40'	1° 12'
Distillation—Below 125.8°*	4%
125.8°–127.8°	3%
Below 127.8°	7%
127.8°–128.8°	8	3	4%
128.8°–129.8°	23	6	64%
129.8°–130.8°	60	36	28%
130.8°–131.8°	35
131.8°–132.8°	4
132.8°–135.8°	5
Residue	2	4	4.

*In all the distillations here recorded the thermometer was read to even degrees and fractional readings are due to corrections for exposed mercury column.

The specific gravity of each successive 25% of distillate or distillate and residue from No. 2 was also taken.

First	25%.....	Sp. Gr.....	0.818
Second	25%.....	Sp. Gr.....	0.813
Third	25%.....	Sp. Gr.....	0.811
Fourth	25%.....	Sp. Gr.....	0.809

In the first 25% of distillate a distinct trace of water settled to the bottom. This sample, therefore, supposed to be of exceptionally good quality was not as good as Number 1.

Later, for the purpose of comparison, a sample of Kahlbaum's Amyl Alcohol, boiling point 130°–132°, was purchased, which distilled as follows:

130°–131°	15 percent
131°–131.5°	82 "
Residue	3 "

Rotation in 100 mm. tube, -1° 20'.

Alcohol Number 1 was of proper quality for making amyl nitrite and not too expensive for that purpose. What manner of nitrite could be made from it?

(1) To answer this first question 150 cc. (122 gm.) of the alcohol was placed in a 250 cc. side-neck distilling flask which was connected with a Liebig condenser and nitrous gas generated in another flask from nitric acid (sp. gr. 1.35) and arsenous acid, was passed through it. During this saturation no attempt was made to keep the alcohol cool but it was permitted to heat up and hence the arrangement for condensing any volatilized nitrite and collecting it in a flask placed below the condenser. The stream of gas was continued until the crude amyl nitrite changed from a green color to brownish color and the colored vapors began to pass through without absorption. The process was now stopped, the small amount of distillate and the contents of the flask transferred to a separatory funnel and the lower layer of acid-water run off. The crude nitrite was now washed, first with water, then with sodium carbonate solution (about 5%) until the washings were no longer colored yellow, then with water, and finally

dried over calcium chloride. After the purification 163 cc. (142 gms.) of amyl nitrite was obtained and this was fractionally distilled:

90°- 92°	3.7 percent
92°- 94°	3.7 "
94°- 96°	30.0 "
96°- 97°	20.9 "
97°- 98°	15.3 "
98°- 99°	7.0 "
99°-100°	3.7 "
100°-105°	6.1 "
105°-110°	3.7 "
Residue	4.5 "

Of the entire product, 84 percent. distilled between 90° and 100° and 73 percent. between 94° and 99°. The fraction distilling between 90° and 100° showed no test for aldehyde, showed an acidity of 0.5 cc.* and assayed 99 percent. An assay of the original nitrite as obtained before distillation was not made, but it is evident that without this additional rectification this product is superior to nearly all the commercial samples previously examined, and after rectification is equal to any of them.

Having found that it is easily possible to make an amyl nitrite better than most on the market and decidedly superior to U. S. P. requirements, the next question arising is naturally regarding the effects of modifications of this process and use of different materials.

(2) Alcohol No. 3 was used for this experiment and 150 cc. were treated as in experiment 1, except that the amyl alcohol was kept cool with ice while passing the nitrous gas into it. A longer time was required before the apparent end of the process. The crude product after washing and drying amounted to 161 cc., which distilled in the following manner:

Below 90°	1.2%	99°-100°	8.4%
90°-92°	1.8%	100°-101°	4.2%
92°-94°	6.0%	101°-105°	9.6%
94°-96°	12.1%	105°-110°	6.6%
96°-97°	11.4%	110°-120°	4.8%
97°-98°	16.9%	120°-130°	1.8%
98°-99°	8.4%	Residue above 130°	3.6%
	90°-100°	65.0%	
	94°- 99°	48.8%	

The fraction between 90° and 100° assayed 96.7 percent., and had an acidity of 0.8 cc. and a mixture of the fractions above 100° and below 90° assayed 73 percent. with an acidity of 1.0 cc. While the fraction 90°-100° was good, yet it is evident that the amyl alcohol had not been thoroughly saturated with nitrous acid. Further, it is shown that a comparatively large quantity of amyl nitrite remains in the portions distilling outside the standard temperature-range if nothing more than the ordinary distilling flask be used for this purpose. In this case the alcohol used was somewhat better than in (1) but from incomplete saturation the resulting product was not so good.

(To be concluded)

*All statements of acidity are expressed as the number of cc. of N/1 alkali required to neutralize the acid in 5 cc. of amyl nitrite, the test being applied as for the U. S. P. test and then the excess alkali titrated with N/1 sulphuric acid.

THE N. A. R. D. CONVENTION.

The Convention of the National Association of Retail Druggists was a most successful gathering, notwithstanding the extremely hot weather which attended the meeting.

From the opening of the convention to its end, the business of the Convention was done with a snap and that attention to objective which always attends the meetings of our sister association. The address of the President was admirable in its treatment of the various

evils which affect the trade, and in its suggestion of remedies for them.

President Finneran, in his address, forcibly advocated the entrusting of the enforcement of drug laws to the Boards of Pharmacy of the several States, uniformity of drug-legislation, and a Federal law to standardize prices.

The report of Secretary Potts showed a depreciation of \$8,000.00 in revenue during the past year, which had been more than compensated for by economies in administration, which showed a net gain to the Association of \$7,000.00.

The Committee on Propaganda reported progress made during the year, and that section of the report dealing with the enforcement of higher standards of purity and freshness in remedies met with the approval of all the delegates. In the discussion that followed, demand was made that physicians use prescriptions which would enable the druggist to

compound the remedies according to the national standards adopted in this country.

The report of the Committee on National Legislation presented a comprehensive outline of the progress made during the past year along these lines.

The Committee on Public Relations in its report insisted on the value of publicity, especially in the newspapers, of matters which would bring about more cordial relations and better understanding between druggist and public. It suggested that each State employ an expert publicity agent for this purpose. This suggestion met with great applause and promise of prompt support.

The Committee on Pharmacy Laws praised the Massachusetts anti-narcotic laws, as models of justice, especially those provisions which restrict the sale of all narcotics in deadly doses, except upon the written prescription of an authorized physician, dentist, or veterinary surgeon. This law provides that all prescriptions shall be kept on file by the druggist, and that the physician shall keep a record in a suitable book of the name and address of all such patients who receive narcotics.

In a vigorously-worded resolution, the Association proffered its services to city, State and Federal officials for the conservation of the drug and medicinal supply. A copy of the resolutions were ordered forwarded to the United States Attorney-General, James C. McReynolds.

RESOLUTIONS.

"WHEREAS, There exists, because of the European war, a scarcity of drugs and chemicals and sick-room necessities, employed in the conservation of the health of the people of this country; and,

"WHEREAS, The welfare of the nation demands that every effort should be made to conserve the existing supply of these articles; and,

"WHEREAS, It is a common knowledge that many wholesale dealers and manufacturers of drugs, chemicals and medicinal products employed in relieving the condition of the sick, are displaying lack of humanitarianism and patriotism by taking advantage of the grave conditions that confront the American people to advance unnecessarily the price of the essential commodities, therefore, be it

"Resolved, That the National Association of Retail Druggists, through its committees and organization forces, and the efforts of its individual members, will extend every assistance to local, State and Federal Governments in conserving the supply of drugs and medicines, and preventing forestalling; and, be it

"Resolved, That the National Association

of Retail Druggists hereby condemns most vigorously the practice of those wholesale dealers and manufacturers in the drug field who have needlessly advanced the price of many of the products they supply."

The officers elected for the ensuing year were:—

President—Samuel C. Henry.

First Vice-President—A. S. Ludwig.

Second Vice-President—W. L. Humphrey.

Third Vice-President—T. C. Coltman.

Treasurer—Grant W. Stevens.

Secretary—Thomas H. Potts.

Executive Committee:—C. H. Huhn, J. F. Finneran, R. J. Frick, T. S. Armstrong, M. A. Stout, J. P. Crowley.

The Women's Organization of the Association was welcomed by Mrs. William E. Lee, President of the local chapter, and a response was made by Mrs. Jessie F. Waterhouse, President of the Women's Organization. Then, following an address by the President, and the receiving of committee reports, it was announced that a scholarship had been founded for the study of pharmacy. The recipient of the free tuition will be chosen by the organization's executive committee from a list of candidates presented to the committee by the various chapters. The committee is also empowered to choose the college to which the scholarship will apply.

The Women's Organization elected the following officers:—

President—Mrs. F. E. McBride.

Vice-Presidents—Mrs. B. A. C. Hoelzer, Miss Clara Hulskamp, Mrs. A. W. Panly, Miss Nora V. Brendle, Mrs. R. G. Rutherford.

Secretary—Mrs. Nellie F. Lee.

Treasurer—Mrs. Otto C. Greenland.

Board of Directors:—Mrs. Jessie F. Waterhouse, Mrs. L. O. Wallace, Mrs. S. A. Eckstein, Mrs. Louis Emanuel, Mrs. John T. Roe, Mrs. W. E. Warn, Mrs. Charles Brunstrom, Mrs. H. A. Pierce.

College and Society

THE COLLEGE OF PHARMACY OF THE UNIVERSITY OF IOWA.

The College was represented at the annual convention of the A. Ph. A. at Detroit by Dean W. J. Teeters; Prof. R. A. Kuever,

Prof. Zada M. Cooper. Dean Teeters was re-elected secretary of the Conference of Pharmaceutical Faculties, and was also nominated a candidate for the presidency of the Association for the year 1914-1915, which vote will be taken by mail.

Prof. Cooper was elected an Associate in the Section on Education and Legislation, and Prof. Kuever was elected secretary of the same section for the ensuing year.

Dean Teeters visited with relatives at Alliance, Ohio, for a few days following the A. Ph. A. meeting at Detroit.

Prof. Zada M. Cooper visited at Cleveland and Wooster, Ohio, for a short time after the convention at Detroit.

The third annual home-coming will be October 22, 23, 24, at the time of the Iowa-Minnesota football game.

A NEW DEPARTMENT OF PHARMACY.

In response to the request of the West Virginia State Pharmaceutical Association the Board of Regents of West Virginia University has established a department of pharmacy.

A two, three, and four year course is offered. The two year course leading to the certificate of Graduate in Pharmacy, provides the foundation in Pharmacognosy and Pharmacy, and the ground work in Analytical Chemistry as applied in the drug business and required for various manufacturing purposes. The third year is especially designed to enable the Pharmacist to practice Urinary, Bacteriological, and Toxicological analysis for the physician and to act as Food and Drugs Chemist either for the U. S. Government or for private corporations. It will be arranged to award the degree of Bachelor of Science (in Pharmacy) to those completing the course of four years, including studies in mathematics, physics, language and science, as well as the entire pharmaceutical work of the two year course. All subjects are taught by men who are specialists in their respective branches.

Professor Charles H. Rogers has been called to establish and also be the head of the department. Previous to his election to his present position he was a member of the faculty of the College of Pharmacy of the University of Minnesota.

The Pharmacist and the Law

INTERSTATE COMMERCE IN SALE OF MEDICINES.

A Minnesota corporation entered into a contract with a resident of Missouri whereby the former agreed to sell and deliver in Minnesota or any of its regular places of shipment, certain medicines and extracts, to be paid for at the usual wholesale prices, and to be delivered when required by the purchaser. The contract also required the purchaser to make regular canvasses in a specified county for the sale of such medicines and extracts, and forbade him to sell to any others. All deliveries of medicines and extracts were made without the State of Missouri. In an action to recover the price of medicines and extracts delivered under the contract it was held that, as the plaintiff reserved no title to the property sold, and merely gave the defendant the option of returning it, the contract constituted "interstate commerce," and hence was not governed by the Missouri anti-trust laws. The plaintiff's right to sue could not therefore be defeated because, though a foreign corporation, it had not procured license to do business in Missouri, as required by Missouri Rev. St. 1909, §3040.

J. R. Watkins Medical Co. v. Holloway,
(Mo.) 168 S. W. 290.

SHIPMENT OF INTOXICATING LIQUORS.

The Delaware Hazel Law (27 Del. Laws, C. 130) provides by section 5 that it shall not apply to the shipment or delivery to physicians or druggists of such liquors in unbroken packages not exceeding five gallons at any one time. Section 6 prohibits any person from bringing into local option territory any quantity of liquor greater than one gallon within 24 hours. The Delaware Constitution, art. 13, §1, provides for an election to determine whether the sale of liquors in certain districts shall be licensed or prohibited, and that, after a vote against license, no person shall thereafter manufacture or sell liquors except for medicinal or sacramental purposes. The Prescription Act (26 Del. Laws, c. 147) requires all prescriptions for intoxicating liquors for

medicinal purposes to be written by practicing physicians. It is held that, in view of the recognized necessity of liquor as a drug, and therefore readily to be obtained by those authorized to prescribe or sell it, the discrimination in favor of physicians and druggists was reasonable, and that the Hazel Law did not deny the equal protection of the law.

The Webb-Kenyon Act (Act March 1, 1913, c. 90, 37, Stat. 699), by its title purporting to divest liquor of its interstate character only "in certain cases," and prohibiting transportation of intoxicating liquors from one state into another, to be received, possessed, sold, or used in violation of any law of such state, does not divest liquor of its interstate character in all cases, but removes the protection of the commerce clause only when the liquor is to be used in violation of any law of the state. Therefore the Hazel Law is held to be invalid as to a shipment and delivery of liquor from another state into a prohibition district of the State of Delaware for the receiver's personal consumption, a purpose recognized by the act itself to be lawful. But, though invalid as to such a shipment, the act is a valid enactment in so far as it regulates, limits, or prohibits the shipment of liquor from one part of the state into a prohibition district in another part of the state.

Van Winkle v. State, Delaware Supreme Court, 91 Atl. 385.

<>

SALE OF INTOXICATING LIQUORS BY DRUGGISTS.

It is held that, under Louisiana Act No. 66 of 1902, a druggist who, in a prohibition district, sold alcohol for medicinal purposes, without prescription, was properly convicted. Under this statute it suffices to charge the offense in the words of the statute, and it is not necessary to state that the offense was committed in a prohibition district.

State v. Tullos, Louisiana Supreme Court,
65 So. 870.

<>

SELLING COCAINE, ETC., WITHOUT PRESCRIPTION.

Texas Penal Code, 1911, art. 747, makes it unlawful to sell, furnish, or give away cocaine or morphine, except upon the pre-

scription of a physician. It excepts preparations recommended in good faith for cholera, etc., sales at wholesale to retail druggists, and to manufacturers or regular practitioners of medicine. It is held that an indictment for unlawfully selling, furnishing, and giving cocaine and morphine to one not having a written prescription of a physician was sufficient, without negating the exceptions as to sales in good faith for cholera, etc.

Brown v. State, Texas Criminal Appeals,
168 S. W. 861.

Of General Interest

MEETING OF THE EXECUTIVE BOARD OF THE AMERICAN DRUGGISTS' FIRE INSURANCE CO.

The Executive Board of the American Druggists' Fire Insurance Company met in Cincinnati, on August 7-8, all of the members of the Board being in attendance.

The business of the Company was found to be growing splendidly. During the first 6 months of the year, it wrote insurance amounting to \$7,685,869.70, at a premium of \$78,925.95, which is an increase over the corresponding period of the preceding year amounting to \$1,191,254.37, at a premium increase of \$12,305.07. On July 1st, the Company had in force business amounting to \$13,581,653.70, at a premium of \$139,778.07. During the first half of the year it had fire losses amounting to \$26,914.27. The expense of conducting business for the first half of the year amounted to \$23,033.44. Its re-insured business at a premium of \$10,762.82. Its Re-Insurance Reserve was increased to \$61,976.47. Its total assets on July 1st, were \$359,018.78, and its total liabilities not including the Reserve for Re-Insurance were \$7,946.24. During the first half of the year the Company saved its policyholders in their premium cost the substantial sum of \$26,308.65, said savings being retained by the policyholders.

SUBSTITUTE FOR ICHTHYOL. . .

The American importation of ichthyol, a peculiar asphaltic material found in Austria, which finds application after appropriate chemical treatment as a very important

medicament, has been, along with many other products, cut off by the war. The raw material (44,347 pounds, valued at \$61,796 in 1913) comes from a fossiliferous deposit near Seefeld, in the Austrian Tyrol. It is carefully selected and subjected to dry distillation. The distillate thus obtained is then sulphonated and subsequently neutralized with ammonia. The use of this material has greatly increased in the last few years, and it has proved very beneficial. Almost immediately following the beginning of the war its price doubled, going to over 60 cents an ounce. Already, however, a firm in St. Louis has a material on the market that has been favorably recommended as an efficient substitute, closely resembling ichthyol itself, says Bulletin 599, United States Geological Survey.

SAN FRANCISCO EXPOSITION NOTES

Work has been started by the \$1,500,000 company on The Inside Inn, to be built just inside the horticultural boundary wall of the Panama-Pacific International Exposition.

France continues to give assurance of unimpaired participation at the Panama-Pacific International Exposition. Following the first cable after the outbreak of the present war came notification, on August 18, that France will send its team of athletes to have a part in the 1915 games.

A special committee of United States customs experts has been appointed to prepare for handling the great volume of business that will be created by the arrival of exhibits at the Panama-Pacific Exposition, and announces that a force of 200 inspectors will be needed at the Exposition freight slips.

Argentina has raised its appropriation for the Panama-Pacific International Exposition from \$1,300,000 to \$1,700,000. Commissioner General Horacio Vincenti has arrived in San Francisco, and work was begun on the Argentine pavilion on August 1. The pavilion with fittings and garden will cost \$300,000.

Two more nations are to participate in the Panama-Pacific International Exposition. Monaco and Roumania have cabled their acceptance. Monaco has requested 3,000 square feet of land for its pavilion—a reproduction of a hunting lodge of Albert I, Prince of Monaco. Roumania has requested 20,000 square feet for its pavilion.

A strip of ribbon two inches wide and

three miles in length will be used by the department of live stock of the Panama-Pacific International Exposition in badges for winners in the various classes. These are in addition to \$450,000 already set aside for live-stock prizes, and not including \$227,000 in purses for the two racing meets for harness horses.

Japan has asked for increased exhibit space at the Panama-Pacific International Exposition, San Francisco. The communication was from Acting Consul General Y. Numano, who had authority from the Government and Commissioner General Yamawaki. Application was made for 10,700 square feet additional in the Palace of Manufactures, which has been granted, and 1,700 square feet additional in the Palace of Food Products.

J. Heyerdahl, Commissioner to Norway representing the Norwegian-American organization of the United States, has returned from Scandinavia and announces that Norway's plans for participation in the Panama-Pacific International Exposition at San Francisco are well advanced. Norway has appropriated \$26,800 for a pavilion and \$13,400 for a battleship to join the international fleet to pass through the Panama Canal to the exposition grounds. In addition, \$30,000 has been raised by Norwegian-American societies.

More than \$20,000 worth of ostriches have arrived for exhibit at the Panama-Pacific International Exposition. The first shipment was 100 birds.

Haiti and Santo Domingo will rush their pavilions at the Panama-Pacific International Exposition. The superintendent of the two pavilions arrived in San Francisco on September 25 to begin work.

UNITED STATES PUBLIC HEALTH SERVICE.

List of Changes of Duties and Stations of Commissioned and Other Officers of the United States Public Health Service.

Board of medical officers convened to meet at Cincinnati, Ohio, at the call of the chairman for the examination of Pharmacist C. G. Carlton to determine his fitness for promotion to the grade of Pharmacist of the first class.

Detail of the board:

Passed Assistant Surgeon W. H. Frost, chairman;

Assistant Surgeon M. H. Neill, recorder.

Board of medical officers convened to meet at the Marine Hospital, Savannah, Ga., at

the call of the chairman, to make a physical examination of Pharmacist R. E. Knouse, and to present questions for the mental examination, to determine his fitness for promotion to the grade of Pharmacist of the second class.

Detail of the board:

Passed Assistant Surgeon J. R. Ridlon, chairman;

Acting Assistant Surgeon A. B. Cleborne, recorder.

Pharmacist C. G. Carlton. Directed to proceed to Cincinnati, Ohio, and report to Passed Assistant Surgeon W. H. Frost for examination to determine his fitness for promotion to Pharmacist of the first class.

Pharmacist Ralph E. Knouse. Directed to proceed to the Marine Hospital, Savannah, Ga., and report to Passed Assistant Surgeon J. R. Ridlon for examination to determine his fitness for promotion to Pharmacist of the second class.

Technical Assistant D. G. Willetts. Directed to proceed to Atlanta, Ga., for the purpose of inquiring into the case of a former employee of the Georgia State Sanitarium, now suffering from pellagra, and thus secure epidemiologic data having a bearing on present studies of pellagra.

Professor E. B. Phelps. Directed, at the request of the International Joint Commission, to attend the hearings to be held by the Commission at points on the Niagara and Detroit rivers Sept. 25-30, 1914, for the purpose of advising on questions affecting the pollution of international waters.

Detailed to visit the experimental works at Luray, Va., during the week of September 7th, to inspect the plant which is now completed and to outline the necessary analytical and experimental procedure.

Pharmacist F. L. Brown. Directed to proceed to Providence, R. I., and report to Passed Assistant Surgeon E. R. Marshall for the purpose of superintending the cleaning up and alterations upon the quarantine vessel "Newark".

Sanitary Engineer H. R. Crohurst. Directed to proceed to Noblesville, Ind., and take charge of the experimental plant being installed for the investigation of strawboard waste.

Sanitary Chemist H. B. Hommon. Directed to proceed to Farnham, N. Y., for the purpose of making preliminary studies of the wastes of the canning industry.

APPOINTMENT.

Raymond D. Kinsey appointed a Pharmacist of the third class in the United States Public Health Service.

BOARD CONVENED.

Board of commissioned medical officers convened to meet at the Bureau for the examination of Pharmacist C. C. Cannon to determine his fitness for promotion to the grade of Pharmacist of the second class.

Detail of the board:

Assistant Surgeon-General W. G. Stimpson, Chairman;

Surgeon C. C. Pierce, Recorder.

Granted 2 days' leave of absence enroute.

Pharmacist G. I. van Ness, Jr. Relieved from duty at the Marine Hospital, St. Louis, Mo., upon the arrival of Pharmacist C. H. Parker, and directed to proceed to Honolulu, Hawaii, and report to the Chief Quarantine Officer for duty and assignment to quarters.

Pharmacist C. H. Parker. Relieved from duty at the Marine Hospital, Chelsea, Mass., upon the arrival of Pharmacist F. A. Stump, and directed to proceed to St. Louis, Mo., and report to the medical officer in charge, for duty and assignment to quarters.

Biochemist Andrew Hunter. Granted 2 days' leave of absence from September 14, 1914.

Technical Assistant H. A. Taylor. Granted 5 days' leave of absence enroute to stations.

PHILIPPINE GOVERNMENT MEASURE.

Ruling on Stocks of Patent Medicines.

The Secretary of the Interior has approved a ruling in the regulations governing the new patent medicine act providing that goods ordered from foreign countries from June 1, 1914, shall not be entitled to the exemption heretofore declared in favor of medicines now in stock or on board ships bound for Manila before July 1. This ruling is said to be to counteract the placing of large orders by certain local houses in order to have big stocks covered by the exemption. Exempted stocks must be disposed of by 1917.

Council Business

COUNCIL LETTER No. 1.

Philadelphia, September 10, 1914.

To the Members of the Council:—

At the meeting of the Council on Saturday, August 29, 1914, the Chairman and Secretary of Council were appointed as the Committee on Nominations of Council Committees for 1914-15, the nominations to be submitted to the Council.

The Committee on Nominations submit the following nominations:

Committee on Unofficial Standards.

(For terms expiring.)

George M. Beringer, Chairman, 501 Federal St., Camden, N. J. Term expires 1918.

H. H. Rusby, 776 DeGraw Ave., Newark, N. J. Term expires 1918.

F. R. Eldred, 3325 Kenwood Ave., Indianapolis, Ind. Term expires 1918.

John M. Francis, 240 Sayburn Ave., Detroit, Mich. Term expires 1918.

Committee on Transportation.

Thos. F. Main, Chairman, New York, N. Y.

W. Bodemann, Chicago, Ill.

Lewis C. Hopp, Cleveland, Ohio.

H. M. Whelpley, St. Louis, Mo.

Chas. G. Merrell, Cincinnati, Ohio.

Chas. Caspari, Jr., Baltimore, Md.

Fred I. Lackenbach, San Francisco, Cal.

E. Floyd Allen, Minneapolis, Minn.

F. C. Godbold, New Orleans, La.

W. S. Elkins, Jr., Atlanta, Ga.

C. Herbert Packard, East Boston, Mass.

F. W. Nitardy, Denver, Colo.

The General Secretary and Local Secretary, ex-officio.

Auditing Committee.

Otto F. Claus, Chairman, St. Louis, Mo.

F. W. Sultan, St. Louis, Mo.

F. O. Pauley, St. Louis, Mo.

Committee on Invested and Trust Funds.

Wm. B. Day, Chairman, Chicago, Ill.

E. G. Eberle, Dallas, Texas.

Charles Holzhauser, Newark, N. J.

H. M. Whelpley, ex-officio, St. Louis, Mo.

Committee on Finance.

J. A. Koch, Chairman, Pittsburgh, Pa.

Otto F. Claus, St. Louis, Mo.

E. H. LaPierre, Cambridge, Mass.

Centennial Fund.

John G. Godding, Chairman, Boston, Mass.

Wm. B. Day, Chicago, Ill.

J. A. Koch, Pittsburgh, Pa.

Committee on Publication.

J. W. England, Chairman, Philadelphia, Pa.

Geo. M. Beringer, Camden, N. J.

E. Fullerton Cook, Philadelphia, Pa.

E. G. Eberle, Dallas, Texas.

F. J. Wulling, Minneapolis, Minn.

Ex-officio Members: The Editor-in-chief of the Journal, General Secretary, Reporter on the Progress of Pharmacy, and Treasurer.

Do you approve of the nominations as made and vote affirmatively for the nominees? This will be known as *Motion No. 1 (Election of Council Committees for 1914-15).*

Motion No. 2 (Election of Members). You are requested to vote on the following applications for membership:

No. 1. James Edward Brewer, 1705 Cherry

Street, Philadelphia, Pa., rec. by J. W. England and W. A. Pearson.

No. 2. Robert C. Wilson, University of Georgia, Athens, Ga., rec. by Wm. A. Hall and W. L. Scoville.

The following applications for membership were favorably acted upon at the Detroit (1914) meeting of the Association, August 24 to 29, inclusive:

No. 346. Alfred DeLang, Fourth Ave. and Broadway, Cincinnati, Ohio, rec. by Frank H. Freericks and E. H. Thiesing.

No. 347. Hans Martin Johnson, 1110 Payne Ave., St. Paul, Minn., rec. by Richard J. Messing and F. A. Upsher Smith.

No. 348. J. P. Tousfeldt, White Salmon, Wash., rec. by C. Osseward and A. W. Linton.

No. 349. Harrison Sidney Groat, Pullman, Wash., rec. by C. Osseward and A. W. Linton.

No. 350. Emily C. McRae, E 1928 Sprague Ave., Spokane, Wash., rec. by C. W. Johnson and Forest J. Goodrich.

No. 351. Ray C. Start, 2555 Cherry St., Toledo, Ohio, rec. by Waldo M. Bowman and C. H. Packard.

No. 352. Paul A. Loesser, Monroe and Lawrence Ave., Toledo, Ohio, rec. by Waldo M. Bowman and C. H. Packard.

No. 353. Elsie Day, 2030 Sumner St., Lincoln, Neb., rec. by Rufus A. Lyman and A. V. Pease.

No. 354. Anton Vorisek, 115 West 68th St., New York, N. Y., rec. by H. V. Arny and Jeannot Hostmann.

No. 355. P. DeLille Borja, S. Stanton 405, El Paso, Texas, rec. by R. H. Needham and C. H. Packard.

No. 356. Herbert Harry DeAlemberte, 121 S. Palafox St., Pensacola, Fla., rec. by W. D. Jones and H. W. Whelpley.

No. 357. Lewis Frankel, 219 New Brunswick Ave., Perth Amboy, N. J., rec. by George M. Beringer, Jr.

No. 358. Louis P. Langhein, 857 Elizabeth, N. J., rec. by George M. Beringer and George M. Beringer, Jr.

No. 359. Charles Drake, 67 Main St., Woodbridge, N. J., rec. by George M. Beringer and George M. Beringer, Jr.

No. 360. John Henry Blake, 597 Valley Road, Upper Montclair, N. J., rec. by George M. Beringer and George M. Beringer, Jr.

No. 361. Meyer David Olshin, 114 Congress St., Newark, N. J., cor. by George M. Beringer and George M. Beringer, Jr.

No. 362. Herbert F. Doden, Iowa City, Iowa, rec. by Wilber J. Teeters and R. A. Kuever.

No. 363. Frederick Hunsche, 4415 N. Winchester Ave., Chicago, Ill., rec. by Wm. B. Day and E. N. Gathercoal.

No. 364. Harold Stone Currier, Plymouth, New Hampshire, rec. by Theodore J. Bradley and J. G. Godding.

No. 356. E. O. Bertram, 614 Helen Ave.,

Detroit, Mich., rec. by Leonard A. Seltzer and Wm. A. Hall.

No. 366. George Hubert Grommet, 2001 Jefferson Ave., E., Detroit, Mich., rec. by Wm. A. Hall and Leonard A. Seltzer.

No. 367. Mark D. Mithskun, 576 Hastings St., Detroit, Mich., rec. by Leonard A. Seltzer and Wm. A. Hall.

No. 368. Walter Henry Liome, 426 Baldwin Ave., Detroit, Mich., rec. by H. M. Averyt and Wm. A. Hall.

No. 369. Harry Wilford Crooks, 169 Elwood Ave., Newark, N. J., rec. by Edward A. Sayre and Charles Holzhauser.

No. 370. Henry J. Schnaidt, Parkston, S. Dakota, rec. by Edward C. Bent and H. M. Whelpley.

No. 371. John Bromwell Wheeler, Huron, S. D., rec. by E. C. Bent and H. M. Whelpley.

No. 372. Wm. Kuehn, 2059 Seminary Ave., Chicago, Ill., rec. by Clyde M. Snow and Wm. B. Day.

No. 373. Albert Schreiner, 8 Wilson St., Batavia, Ill., rec. by A. Schreiner, Jr., and Wm. B. Day (membership *without* publications).

No. 374. Charles P. Kaetzel, 608 Lawrence Ave., Ellwood City, Pa., rec. by J. A. Koch and L. K. Darbaker.

No. 375. Charles Dixon Drach, 410 Walnut St., Latrobe, Pa., rec. by J. A. Koch and A. F. Judd.

No. 376. Harold Marsh, 812 Braddock Ave., Braddock, Pa., rec. by J. A. Koch and Louis Saalbach.

No. 377. Robert Shields Ramsey Wittmer, 22 Broadway, Pittsburgh, Pa., rec. by J. A. Koch and Louis Saalbach.

No. 378. Karl Shaw Burkett, 1620 Antrim St., Pittsburgh, Pa., rec. by J. A. Koch and Louis Saalbach.

No. 379. Charles H. Howard, Market Square, South Paris, Maine, rec. by John G. Godding and A. C. Wagner.

No. 380. Jesse Dibrell Hodges, 207½ Main St., Little Rock, Ark., rec. by H. M. Whelpley and J. W. Mackelden.

No. 381. W. Boyd McGehee, 25 Dexter Ave., Montgomery, Ala., rec. by E. R. Miller and C. H. Packard.

No. 382. Chas. M. Butcher, 5th and Pine Sts., Camden, N. J., rec. by George M. Beringer and George M. Beringer, Jr.

No. 383. Jemison Mims Moseley, Brewton, Ala., rec. by E. R. Miller and C. H. Packard.

No. 384. Miss B. Arete Johnson, 245 Main St., Penns Grove, N. J., rec. by Edgar R. Sparks and George M. Beringer.

No. 385. Madison Willard Washburn, 457 Washington St., Buffalo, N. Y., rec. by Millis McGregory and Frank E. Lock.

No. 386. Helen Perle Annis, 132 LaSalle Ave., Kenmore, N. Y., rec. by Millis McGregory and Frank E. Lock.

No. 387. Hugo F. Staack, Maquoketa, Iowa, rec. by Wm. B. Day and E. N. Gathercoal.

No. 388. Joseph S. Ryer, 1575 Genesee St., Buffalo, N. Y., rec. by Millis McGregory and Frank E. Lock.

No. 389. Frank Kirby Lucas, Avon, N. Y., rec. by Millis McGregory and Frank E. Lock.

No. 390. Ralph Rupp, Johnston, 522 S. East St., Bucyrus, Ohio, rec. by E. Fullerton Cook and Joseph P. Remington.

No. 391. Louis F. Seith, Sgt. 1st Class, Hospital Corps, U. S. A., Military Hospital, Zamboanga, Mindanao, P. I., rec. by Geo. F. Payne and W. B. Day.

No. 392. Charles Edwin Foote, 222 W. Certland St., Jackson, Mich., rec. by Ernest C. Marshall and J. W. England.

No. 393. George Adrian Burkhardt, 4159 Magnolia St., St. Louis, Mo., rec. by J. A. Wilkerson and J. W. Mackelden.

No. 394. J. A. Stewart, 720 Jefferson Ave., E., Detroit, Mich., rec. by Leonard A. Seltzer and Wm. A. Hall.

No. 395. J. T. Delzell, Hersey, Mich., rec. by Wm. A. Hall and Leonard A. Seltzer.

No. 396. Charles Sumner Koon, 35 W. Western Ave., Muskegon, Mich., rec. by Leonard A. Seltzer and Wm. A. Hall.

No. 397. Albert G. Riestein, Detroit, Mich., rec. by Wm. A. Hall and Leonard A. Seltzer.

No. 398. Frank P. Lehr, 5400 Franklin Ave., Cleveland, Ohio, rec. by Lewis C. Hopp and W. C. Alpers.

No. 399. Andrew Edward Walleck, 8341 Woodland Ave., Cleveland, Ohio, rec. by L. C. Hopp and W. C. Alpers.

No. 432. Geo. E. Doyle, 1190 West Fort St., Detroit, Mich., rec. by Wm. A. Hall and J. W. England.

No. 433. Adelbert P. French, 2782 Woodward Ave., Highland Park, Mich., rec. by Wm. A. Hall and Leonard A. Seltzer.

The following is a list of the members of the Council for 1914-15. Please notify the Secretary of the Council of any errors or omissions.

COUNCIL LETTER No. 2.

Philadelphia, October 2, 1914.

To the Members of the Council:—

Motion No. 1 (Election of Council Committees for 1914-15), and No. 2 (Election of Members: Applications Nos. 1 and 2) have each received a majority of affirmative votes.

At the Detroit (1914) meeting, a resolution was passed that a committee be appointed to consider the question of the American Pharmaceutical Association having an exhibit at the Panama Pacific Exposition in 1915; and Albert Schneider, Chairman, F. J. Wulling and E. Fullerton Cook were named as the committee.

The following letter has been received:—

Philadelphia, September 23, 1914.

Mr. Joseph W. England, Philadelphia, Pa.:—

Dear Mr. England:—Your letter of the 19th was received, and I am compelled to ask that some other name be placed on the Committee for the exhibit at the Panama Exposition. I will not be able to be at San Francisco and will not have the time during the coming year to satisfactorily do my part on this Committee. Please submit to the Council this letter and ask that I be relieved from the appointment. Yours very truly,

E. FULLERTON COOK.

Albert Schneider, Chairman of Committee on proposed A. Ph. A. Exhibit at the Panama-Pacific Exposition, writes to the Secretary of the Council that he has secured tentative space reservation for the proposed A. Ph. A. Exhibit to be held until October 15, "by which time we must decide whether or not we want it." He writes as follows:—

To the Members of the Council.—

Gentlemen:—The following is submitted:—Preliminary Suggestions on a Working Exhibit for the American Pharmaceutical Association to be Placed in the Liberal Arts Building of the Panama-Pacific International Exposition at San Francisco, California, 1915.

After giving the matter a brief but careful consideration I feel satisfied that the most interesting exhibit and the one which would attract the most attention and do the most good is a working exhibit illustrating the methods for testing and standardizing the drugs of the U. S. P. I have secured tentative space reservation in the Liberal Arts Building, 30 by 21 feet floor space. This space will be held for the A. Ph. A. until October 15th. In my opinion this space is entirely adequate for a working exhibit, and also a still exhibit for which the wall space would serve very nicely. I take the liberty of submitting the following suggestions on a combined still and working exhibit.

STILL EXHIBIT.

1. Samples of U. S. P. drugs and preparations.
2. Striking examples of drug adulteration.
3. Complete set of U. S. Pharmacopœias, etc., etc.

WORKING EXHIBIT.

1. Equipment for making chemical tests and assays of U. S. P. drugs and preparations.
2. Equipment for making microscopical analyses of drugs and pharmaceutical preparations.
3. Equipment for bacteriological work. Sterilization, etc.
4. Equipment for making physiological assays of drugs and pharmaceutical preparations.

I am of opinion that the apparatus can be secured at comparatively small cost, perhaps as loans from the equipments of Colleges of Pharmacy and from manufacturing houses that hold membership in the A. Ph. A. The cost of installing will be comparatively slight. The big item of expense will be the cost of operation during the time that the Exposition is open, from February 14, 1915, to December, 1915. I believe that the entire cost of installation and operation will not exceed five thousand (\$5,000.00) dollars for the time of the Exposition year. I have no doubt that much of this sum could be secured through private subscription, should the A. Ph. A. not be able to subscribe the entire amount.

A copy of this preliminary report is submitted to my associates on the committee, Dr. F. J. Wulling of the University of Minnesota, and Prof. E. Fullerton Cook of Philadelphia. In the meantime I am waiting to hear from my associates. In order that no time may be lost I would suggest that this report be submitted to the Council for consideration. Very truly yours,

ALBERT SCHNEIDER,

Chairman of A. Ph. A. Exposition Exhibit Committee.

It will be recalled, also, that at the Detroit (1914) meeting the Committee on President's Address reported concerning the suggestion that the Committee on Publication be given enlarged powers, etc., as follows:—

12. "The Committee on Publication, in view of the Publication of the Journal and other duties, require some addition to their clerical force and the recommendation of the President is approved that the appropriation of the Committee be paid in quarterly sums in advance. It is further recommended that the Council takes steps to give the Committee on Publication more extended power."

At the General Session held on Saturday, August 29th, this recommendation was referred to the Council.

In this connection, the following letter has been received by the Chairman of the Com-

mittee on Publication from Ex-President Beringer and is referred to the Council for action:—

Camden, N. J., September 23, 1914.

Mr. Joseph W. England, Chairman of Committee on Publication, Philadelphia, Pa.:—

My Dear Mr. England:—I realize that as Chairman of the Committee on Publication, you are desirous of fully understanding the recommendations relating to the Committee on Publication and its increased powers contained in the President's address, and your wish to comply with same and have these changes put in operation as soon as they meet with the approval of the Council and the Committee on Finance have acted thereon.

My sole purpose is to have the work of the Committee on Publication carried on in the most efficient, business-like way. The Editor and the Chairman of the Committee should be in close touch and frequent communication so that the work of the office can be promptly expedited, and, at the same time, no question as to the authority of the Editor, such as the selecting and paying clerical assistance, etc., could arise. I know that during the past year, the Acting Secretary and Editor and likewise prior the Editor had advanced the pay for the office force and had carried these accounts for six or eight weeks or even more before being reimbursed. The same thing has occurred regarding other expenses, such as postage and expressage.

With the increased business of this Committee through its publication of the National Formulary and other activities, which we hope will be successful, the work of the Committee is going to materially increase and its financial management should be simplified. We certainly should not expect the Secretary or any other member of the Association to carry the finances and responsibilities of the Committee. My recommendation was that the Committee should be given broader powers, namely, the right to organize a proper clerical and editorial staff so as to efficiently conduct the business of the Committee. That to avoid the delay incident to our present method of paying bills of the Association, that the Committee's appropriation be paid to them quarterly and that they elect a treasurer who should honor drafts made by the Editor and counter-signed by the Chairman and keep correct accounts of all receipts and expenditures on behalf of the Committee subject to the approval of the Council and the Auditing Committee thereof. My understanding of the action of the meeting on Saturday was the approval of the recommendation in the president's address, which had likewise received the approval of the Committee on President's Address, and that the reference to the Council was to have same put into force by the body charged with the business of the Association.

If an additional motion is considered necessary for the Council to carry out the intent of the recommendation approved by the meeting, then I will move that the Council author-

ize the Committee on Publication to effect a re-organization and to systematize its work, as recommended.

Yours very truly,

GEORGE M. BERINGER.

The motion is seconded by Dr. F. E. Stewart.

Motion No. 3 (Authorization of Committee on Publication to Effect a Reorganization and to Systematize its Work). Do you approve of the motion as above presented?

Motion No. 4 (Election of Members). You are requested to vote on the following applications for membership:—

No. 3. Victor Charles Muehlberg, 1800 Race street, Cincinnati, Ohio, rec. by Edw. Voss, Jr., and Frank H. Freericks.

No. 4. Sister Mary Wilfred, Mt. Carmel Hospital, West State street, Columbus, Ohio, rec. by Anna G. Bagley and E. C. Marshall.

No. 5. Henry Corbin Fuller, Institute of Industrial Research, 19th and B street, N. W., Washington, D. C., rec. by C. E. Caspari and H. M. Whelpley.

No. 6. William T. Hanlon, Sergeant, Hospital Corps, U. S. A., Ambulance Company Number Five, Texas City, Texas, rec. by H. W. Riess and John Duignan.

No. 7. Frank Trainer, Regimental Hospital, 22nd Infantry, Texas City, Texas, rec. by H. W. Riess and John Duignan.

No. 8. J. Luther Bradley, Sergeant Hospital Corps, U. S. A., Regt. Hospital, 26th Infantry, Texas City, Texas, rec. by H. W. Riess and John Duignan.

No. 9. Thomas E. Bussey, Sergeant Hospital Corps, U. S. A., 27th Infantry, Regt. Hospital, Texas City, Texas, rec. by H. W. Riess and John Duignan.

No. 10. John Sidney Miller, Rugby, N. D., rec. by W. P. Porter and J. W. England.

No. 11. Charles Isaac Clough, Tillamook, Oregon, rec. by Louis G. Clarke and C. H. Packard.

No. 12. Frank Leslie Downes, 3 Cherry street, Binghamton, N. Y., rec. by Louis Berger and J. Leon Lascoff.

No. 13. Nicholas Drugoncin, 32 Adams avenue, W., Detroit, Mich., rec. by Leonard A. Seltzer and Wm. A. Hall.

No. 14. R. E. Hugill, 32 Adams avenue, W., Detroit, Mich., rec. by Leonard A. Seltzer and Wm. A. Hall.

No. 15. Albert Roberts Pruett, Leary, Ga., rec. by Max Morris and W. S. Elkins, Jr.

No. 16. Ernest Ray Jones, 489 Bewick avenue, Detroit, Mich., rec. by Wilbur L. Scoville and Leonard A. Seltzer.

No. 17. Robert Liston Gaddy, 5 West Main street, Dillon, South Carolina, rec. by J. W. England and J. H. Beal.

J. W. ENGLAND,

Secretary of the Council.

Proceedings of the Local Branches

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Acting Editor on the day following the meeting, if possible. Minutes should be *plainly* written, or typewritten, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

<>

COLUMBUS.

The September meeting of this Branch was held on Friday evening, September 25, at the Y. M. C. A. Building, with Pres. Geo. B. Topping in the chair. The records of the last meeting were read by Secretary Spease and were approved.

The Committee on Constitution and By-Laws submitted a report, and on motion the report was accepted and the Constitution and By-Laws adopted for the government of the

Branch. These provide an election of officers at an annual meeting in May, and dues of twenty-five cents yearly for each member.

Professor Kauffman reported for the Committee on A. Ph. A. building, that the Chamber of Commerce had formally offered a site for the building of the A. Ph. A. office headquarters and laboratories, said site to be a gift from the City of Columbus to the Association.

President Topping spoke of the great influence which the Branch could exert in bringing the members together socially, and suggested that its meetings should be devoted to the solution of problems of store-work, prescription difficulties, helpful suggestions for the preparations of the Pharmacopœia and N. F., and to addresses by persons eminent in the various fields of pharmaceutical work. He thought in this way that the meetings would be most profitable and would be looked forward to by all the members as most entertaining and instructive. He appointed as Committee on Program, Professor Dye and Messrs. Young and Marshall.

Mr. Spease spoke of the Year Book of the Association, called attention to the fact that the information therein contained was valuable, but it was of ancient date, and suggested that if the Year Book abstracts could be published in the Journal as they were made by the Editors, the information conveyed thereby, would be fresh and of the greatest value to all the members. Professor Kauffman spoke along the same lines.

Discussion was had upon the value of the work of the Public Health Federation, an association of all persons interested in legislation for the health of the community. It was described as being one representing about 35,000 members in Ohio, who would bring their united influence to bear on the Legislature in favor of or against legislation affecting public health measures. In this association the pharmacists, physicians, dentists and veterinarians were represented and it was thought that by their union of effort, many obnoxious measures might be successfully opposed and those really for the welfare of the public be urged to passage into law.

Mr. Funk suggested that a committee be appointed to confer with the State Association and ask for the appointment of a joint committee to request of the Ohio State University, the establishment of a Botanical Garden at that institution, of which a special

feature should be the cultivation of medicinal plants.

Professor Kauffman thought the idea an excellent one, and that the Department of Botany would favor such establishment. The President appointed Messrs. Young and Lehmann as such committee.

Professor Kauffman spoke of the scarcity of potash deposits in this country, and said that effort should be made generally by pharmacists to have physicians prescribe salts of sodium in place of those of potassium; the former being equally useful as a remedial agent, and in many cases superior to the potassium salt.

Mr. Marshall spoke of the importance of every member taking an interest in the affairs of the Association. These affairs affected every pharmacist in the country and he instanced the signing of a recent contract with Lippincott & Co., for printing the National Formulary, a contract involving a large amount of the Association's money. This was one of the most important assets of the Association, and all members should be interested in the proper working-out of all the problems connected with it, its printing and distribution, in order that the true interests of the Association should be conserved.

The meetings of the Branch were fixed for the last Friday in each month except for the months of June, July and August.

Changes of Address

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of change of address is received before shipment or mailing.

Both the old and the new address should be given, thus:

HENRY MILTON,

From 2342 Albion Place, St. Louis, Mo.

To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or typewritten.

The Sixty-Second Annual Convention

Held at Detroit, Michigan, August 24-29, 1914

FOURTH GENERAL SESSION.

President Beringer called the fourth general session to order Saturday, August 29, at 11 o'clock a. m. in room B of the Convention Hall of the Hotel Pontchartrain, Detroit.

The first order of business was the reading of the minutes of the third general session.

On motion, the minutes were approved.

Secretary England of the Council read the minutes of the Council sessions to date. Mr. Hynson moved that the minutes be approved.

Mr. Harry B. Mason, of Detroit, asked if the approval of the minutes of the Council carried with it the approval of the resolutions submitted by the House of Delegates. President Beringer replied that the approval of the minutes meant that this Association likewise approved the action of the Council in regard to those resolutions.

Mr. Mason said he would like to say just a word before a vote was taken. He said, in regard to the publishing of news in the local papers, and providing for the appointment of a reporter to the local press at future conventions whose duty it should be to see to it that the news is O. K'd, corrected and verified before it is published in the newspapers, he had no objection to the resolution, but he thought it unwise to adopt it as it would be impracticable. As Chairman of the Committee on Publicity, he, more than anyone else, of the officers of the Association, was responsible for the printing of news at Detroit. It had been his experience that it was absolutely impossible to correct or do anything with newspaper men; you

could ask the reporters to submit the news before it was printed, and they will be perfectly willing to do so, but the next day another set of reporters would come in so that the matter was absolutely outside of the control of the Association. The report printed on Tuesday morning, and which caused the introduction of this resolution, was the result of misinterpretation of a portion of the address of President Beringer, and he was righteously indignant about it. The Committee on Publicity did not see the particular reporter of that session. Mr. Mason said he saw this reporter later and asked him to correct the mis-statement and it was corrected in small eight-point down at the bottom of the page where nobody would notice it. The Association had no control over this matter and it might as well attempt to drive a team of six oxen in six different directions as to attempt its regulation. He moved that this resolution be stricken from the report of the Council, but that otherwise the minutes be approved.

Mr. Raubenheimer said, if Mr. Mason had been present at the Council meeting and heard the discussion on this question, he would understand that it was simply for the purpose of preventing any such future misrepresentation in the newspapers.

This committee which was proposed to be appointed, was to consist of an associate reporter and the chairmen of the several sections of the Association. This was advocated for the express reason of preventing one section from getting the entire glory and some other section not getting any publicity. This plan would place the responsibility on the reporter and the chairmen of the different sections.

Prof. F. J. Wulling thought the recommendation as originally made should stand. The Association could afford to try a new experiment. The old way had failed in many instances and if the new way failed, they would not be any worse off than they were before. The method suggested had been tried out elsewhere successfully. The purpose was to correlate all the authentic news from authentic sources, and it was proposed to communicate the authentic information immediately to this reporter, by whom the news would be given to the press. Such committees had been established by other associations and the scheme had worked out very well, both to the satisfaction of the press and the Association. The press had met the reporters of this kind very gladly and said, "If you will give us the news we will print it," and they did print the news in the way in which it was given them, with, of course, certain additions of headlines and the giving of prominence to things which they thought had more human interest than others.

Mr. Mayo stated that everyone was perfectly well aware of the fact that human interest was the thing that counts with the press. The press wants sensational things to happen, and the Association cannot prevent them from printing such news. It is absolutely impossible to prevent it in any way, and the only thing the Association could hope to do in the appointment of this committee would be simply, to give the newspapers prompt, authentic, interesting news, which may bring to the Association a desirable publicity, and, possibly, tend to diminish the tendency toward sensationalism. But the prominence given the news depended upon the newspaper and not upon the local committee. He did not want Mr. Mason to get the idea there was any reflection intended by the resolution upon the work of the local publicity committee.

Mr. William A. Hall, as a member of the local press committee, said that the

local committee in each place is in much more intimate touch with the press in their community, than any committee that might be appointed from the Association, unless such committee happened to reside in the place of meeting. As a matter of fact, Mr. Mason and he were *persona grata* to some of the papers in Detroit, and they had secured the promise of the press to print a good write-up for the convention and the reporters were specifically requested to come to Mr. Mason for the news. The reporters came and arrangements were made with them, but these reporters did not cover all the sessions.

Mr. Mason said that, after what had been said, he did not think the subject was one of sufficient importance to take up the time of the Association, and for that reason withdrew his motion.

Mr. Hynson's motion was then adopted.

The Chair then stated the next order of business to be taken up would be the report of the Special Committee on Rules and By-Laws. (Printed on P. 1280—September issue.)

The report of the committee was read and its recommendations approved without debate, in so far as embraced in Sections 1 and 2 of their report as to amendments to the General Rules, and the amendments to the By-Laws embraced in their report in recommendations three to ten, both inclusive.

Section 11 of the committee's report was read as to reports of committees requiring those reports to be sent to the General Secretary in advance of the first general session. Prof. F. J. Wulling asked if the recommendation applied to all committees or only to standing committees. Mr. Mayo said that he thought it should apply to all committees which were appointed at the meeting preceding. It was an important amendment and he moved its adoption. Mr. Nitardy seconded. The motion was adopted. Recommendations 12 and 13 were adopted without debate.

The amendments proposed at Nashville were then acted upon, and Mr. England read the report of the Committee on Revision of the Constitution and By-Laws, as follows:

American Pharmaceutical Association:—

GENTLEMEN:—It will be recalled that at the Denver (1912) annual meeting of the Association your committee presented a full and comprehensive report, proposing certain changes in the constitution and by-laws, which was received, ordered printed in the Journal, and its further consideration postponed until the following annual meeting; and reprints were directed to be made of the report and of the existing Constitution and By-Laws, so as to facilitate comparison and consideration of the changes proposed; this was done, but at the Nashville (1913) meeting no action was taken on the report of the committee as a whole, by reason of lack of time, although some of the proposed changes in by-laws were made.

An important question is as to the status of the changes in the Constitution and By-Laws proposed by the committee in its report. They are apparently still before the Association as the report has been received, and the committee has not been discharged.

If recent discussions in the journals count for anything, there will be a number of changes in by-laws proposed at this meeting, covering the business procedure of the annual meetings, and your committee urges that the whole subject of the work of the Association be discussed, and that the by-laws be amended, not piecemeal, but by comprehensive, well-balanced changes.

Action should be taken at this meeting upon the amendments to Article IV and Article V of the Constitution presented at the 1913 annual meeting, as under the present Constitution, the proposed changes were postponed until this annual meeting.

The proposed Article IV reads: "All money received from life membership, together with such funds as may be bequeathed, or otherwise donated to the Association, shall be invested by the Treasurer in United States Government, State, Municipal, County or other securities acceptable as security for postal savings deposits, the interest of which for any current year only may be used by the Association for its expenses."

The proposed Article V reads: "Every proposition to alter or amend this Constitution shall be printed in the Journal at least thirty days prior to the annual meeting; shall be read at the first General Session of the annual meeting, and shall be balloted upon at a subsequent General Session, when, upon receiving the affirmative votes of two-thirds of the members present, it shall become a part of the Constitution. Any proposition to amend the Constitution for the purpose of permitting the expenditure of the permanent invested funds of the Association shall require a majority of seven-eighths for its passage."

SUPPLEMENTARY REPORT.

We recommend that action be taken.

To amend Chapter IX, By-Laws, Article XII, by striking therefrom the word Section and the numerals following, wherever same appears therein.

By striking out the line now reading: "Section 3—The Report of the Committee on Nomination shall be read."

To amend Chapter IX of the By-Laws, Article XV, to read:—

Article XV—At the last General Session of the Association the report of the Committee on Nomination shall be presented; all unfinished business disposed of and the officers for the Association for the ensuing year shall be installed.

To amend Chapter 1 of By-Laws by adding a new section to read as follows:

Section VI—Any vacancy in the officers elected by the Association or by any of the Sections occurring in the interim between meetings shall be filled by appointment by the President.

Respectfully submitted, J. W. ENGLAND.
Chairman of Committee on Revision of Constitution and By-Laws.

The first amendment, that to Article IV, came up for action.

Dr. H. M. Whelpley said he did not believe the wording of the proposed amendment carried out the exact idea that was intended. As read, it was made obligatory for the Treasurer to make the investment. It was not intended, as the money accumulated, to have it put into bonds, as such procedure was not practical for the reason that bonds of small denomination cannot be purchased. It was his recollection that the intent of the mover was to so amend the present by-law that it would be possible to invest in a class of securities which was not provided for under the present by-law. The present by-law restricted the investment of funds to United States and State securities, and the intention of the proposed amendment was to give greater flexibility in the nature of the securities.

The ground of Mr. Whelpley's objection was the use of the word "shall" in the proposed amendment, which, if carried, would make it obligatory.

President Beringer stated that was the present wording of the proposed by-law. Mr. Whelpley said then the present wording was wrong and that such a course had not been lived up to; that, for example, part of the funds of the Association

were in the Boston Penny Savings Bank, where it had been for years, and had been turned over to him as Treasurer, in that shape.

President Beringer inquired if it had not been the idea of Dr. Beal that this money should be invested in some permanent investment rather than lie there in a savings fund. Mr. Whelpley replied that the proposed amendment conflicted with the rule of finance, which provided that investments shall be made only through the coöperation of the Finance Committee and the Committee on Invested Funds.

Mr. Whelpley then moved that the word "may" be substituted for the word "shall," the wording otherwise to remain the same. The original motion, as amended, was then adopted.

Mr. England then read the proposed Article V.

Mr. Nitardy moved the adoption of the above article; motion seconded by Mr. Hostmann, and carried.

The proposal to amend Chapter IX, Article 12, in reference to the report of the Committee on Nominations was, on motion of Mr. Anderson, seconded by Prof. Hynson, laid upon the table.

Mr. Harry B. Mason took the floor and said that as Chairman of the Commercial Section he desired to report upon a resolution which had been introduced in the Commercial Section and referred to the General Session, which had been offered by Mr. George H. Schafer, which resolution read as follows:

"Resolved, That a special committee of the American Pharmaceutical Association, consisting of five or more members, be appointed to consider by correspondence and otherwise, a feasible plan to submit to the National Board of Fire Underwriters whereby the onerous and practically impossible requirements of an annual inventory of drug stores be waived or modified to such an extent as to conform with common sense and honesty, thus furnishing full protection for both insured as well as the insurance company."

Mr. Carter moved the adoption of the resolution as read.

Mr. Albert O. Zwick, of Cincinnati, said he thought they were acting a little hasty on the above resolution and asked to have it re-read.

The Secretary read the resolution, after which Mr. Zwick asked if it was the purpose of the resolution that the subject be investigated by the committee and that they then make a report to the Association on the question of the feasibility of dispensing with an annual inventory. Mr. Zwick said his presence at the convention was accidental, but he was very glad to be there. He further said he was a member of the Association and spoke also as a member of the Executive Committee of the American Druggists' Fire Insurance Company; that this question had been up for debate many times in Executive Committee meetings, and he assured the audience that it was a very serious matter indeed because a drug store without an inventory, is, in case of fire, like a ship without an anchor in a storm, and it was very difficult to adjust a loss if an inventory was dispensed with, and he thought there should be some plan proposed whereby they could secure reliable data as to the amount of stock the druggist may have had before his fire. As he understood the resolution, it asked the National Board of Underwriters to consider whether it would be possible to dispense with the inventory. Mr. Carter replied that the wording was "annual inventory." Mr. Zwick asked why they laid stress on the "annual." Mr. Carter replied they didn't all take annual inventories. Mr. Zwick said he

knew that. Mr. Carter said many druggists took inventories once only every two, three or five years and consider that that is a fair basis. Mr. Zwick replied that he thought it dangerous to base anything on such an inventory.

Mr. George F. Payne said he thought the other members understood it as he did, that many hardships were imposed upon pharmacists in insurance company matters, on account of the insurance companies really not understanding the situation.

Mr. Zwick said everybody knew the importance and desirability of an annual inventory and the resolution, it seemed to him, should take up the matter as to how a man could make the showing that he should under the conditions that surround him. He said he had been an insurance adjuster for a number of insurance companies at different times in drug fires, and while acting under the directions of the insurance company, he had had the druggist come to him after the matter was over and shake him by the hand and say he had done more for him than his own representative had. He further said it was a good idea to take these matters up because there were many points which the insurance companies were perfectly willing to act upon in a way that was favorable to the pharmacist which the pharmacist did not really understand himself.

Mr. George H. Schafer, of Fort Madison, Iowa, said if the fire insurance company representatives could have been present at the meeting in which this matter had been discussed and had seen the interest taken in the discussion, they would have appreciated the difficulties in the way of taking an annual inventory. He had no doubt they did appreciate them in their practical experience and they would remedy them if there was any body of men capable of taking the initiative in this matter, and seeing what can be done. It was proposed by the resolution to appoint a committee that would confer with this National Insurance body in order to bring about a modification or a waiver of the insurance clause to such an extent that the difficulties would be surmounted. Mr. Schafer said following the adoption of the pending resolution he had a brief motion to make which he thought would supplement it in such a way as to make it perfectly satisfactory to the insurance underwriters.

Mr. Hynson said the proposition was bad practice and the adoption of this resolution would virtually mean that the American Pharmaceutical Association endorsed the worst commercial practice he knew of, and he certainly hoped for the sake of the Association it would not endorse the resolution.

The motion was then voted upon and lost.

The President then called for the report of the Committee on President's Address, and stated as he was vitally concerned in the report, he would ask the Vice-President to take the chair. (Report printed in October issue.)

The Secretary then read the first recommendation of the report of the Committee on President's Address, which is as follows:

"The endorsement of the objects of the International Pharmaceutical Federation be approved, and it is recommended that the Council be authorized to make application for active membership of the American Pharmaceutical Association."

Upon motion of W. C. Anderson, and seconded by A. M. Roehrig, the above recommendation was adopted.

The Secretary then read the second recommendation, which is as follows:

"The recommendation of the President to reduce the number of members necessary for the organization of a local branch be reduced from twenty-five to fifteen, and that the Chairman of the Committee on Local Branches should provide for a bulletin to be issued to the local branches suggesting topics of importance for discussion."

Upon motion of Mr. Whelpley, duly seconded, the above recommendation was adopted.

The Secretary then read the third recommendation, which is as follows:

"The recommendation of the President that a Special Committee should be created on *Pre-requisite Laws* to take such action as will encourage the Pharmacists of each state where such a law does not exist to have passed an amendment to the pharmacy law which will secure the passage of such a pre-requisite law. It is suggested by your committee that the election of this special committee be referred to the Council for action."

Upon motion of Mr. Otto Raubenheimer, seconded by Mr. Nitardy, the above recommendation was adopted.

The Secretary then read the fourth recommendation, which is as follows:

"The suggestion of the President that the Council shall take into careful consideration the subject of the preparation of a *Pharmaceutical Syllabus*, expressive of the views of pharmaceutical educators is approved."

Mr. Deaton moved the adoption of the above resolution; motion seconded.

Mr. Anderson said he believed they had provided by a previous resolution for the appointment of seven members on the Syllabus Committee, and asked if this meant that they were to have another Committee on Pharmaceutical Syllabus appointed? One of the members replied he did not think so; it simply meant the adoption of the syllabus.

Mr. Anderson said he did not so understand it; that he understood this to be a resolution that would in reality have the Association go on record as repudiating the work of the seven members of the Syllabus Committee that had been working for several years on this proposition, and appoint another committee to take up syllabus work, and if that was the case, he very decidedly disapproved of the recommendation and hoped the Association would do the same.

Mr. Deaton said he thought the recommendation meant the adoption of the syllabus, and in view of his misunderstanding, withdrew his motion.

Mr. Anderson then moved that the Association disapprove the recommendation; motion seconded.

Mr. S. L. Hilton, of Washington, said he thought the recommendation was a very good one. He thought the time had arrived when the American Pharmaceutical Association should take over the compilation of the publication of the *Pharmaceutical Syllabus*; the last edition of the *Pharmaceutical Syllabus* with its errors, with the subject matter that it contains and its recommendation that it shall be carried out in a two years' course, is a matter that is impractical and is a disgrace on American Pharmacy, and a disgrace upon the American Pharmaceutical Association. He said if one would look over the last pages of the book giving the works of reference, some of which were almost impossible to decipher, he would see the titles were mis-spelled, they were incorrect, so that that part of the book might just as well be torn out and thrown away, and yet, with all these errors, they wanted to have the book as a standard for the schools of pharmacy

in this country; that he for one, connected with a school of pharmacy, was frank to admit they could not use the book in the way of giving a three-year course.

Dr. William Mansfield, of New York, in answer to the gentleman just speaking, said that he believed he had not paid the proper attention to the book; that the gentleman had not read the preface to the book, and if a college of pharmacy did not give that minimum course of instruction, he would not have much of an opinion of the men who graduated from such an institution. He further wanted to say that the work of that Syllabus Committee represented the work of some of the best minds in the pharmaceutical profession, and it was a mere proof of ignorance on the part of the previous speaker not to appreciate the extent of the good work that had been done by that committee, and he sincerely hoped that the remarks of the gentleman who preceded him would be stricken from the minutes of these proceedings.

Prof. William B. Day said, as a member of the Syllabus Committee, he merely wished to say that the work represented the labors of the seven men appointed by the Association, and whatever the errors or mistakes which may have crept into the syllabus are, the work represented the efforts of their committee over a considerable term of years, and he hoped the efforts of the committee would not be repudiated by the Association. He said he did not claim that the syllabus was by any means perfect, and it was not offered as anything perfect, and that they expected to revise it, and he thought to take such action and move the appointment of another committee to prepare an entirely new syllabus would be a grave mistake; that they had already presented the syllabus to the schools throughout the country and the Boards of Pharmacy, and it had been adopted by quite a number of boards and schools, and he thought the work could not now be thrown overboard and go for naught.

Mr. Apple asked that the members carefully consider the phrase "expressive of the views of pharmaceutical educators is approved," contained in the recommendation.

President Beringer said he desired to speak on this subject; that he did not think there was any subject more important to pharmaceutical education than outlining the proper course of instruction, and when the Association became a party to the outlining of a course of instruction it should present what can be done and what ought to be done. He said he had looked very critically into the subject and had been a member of the committee and gone through the trials and tribulations they had had in that committee for three or four years, and he knew what was meant by the honorable discharge of duty, and stated the Association could not afford to endorse something which on its face was not correct; that there was not an honest, capable school of pharmacy which could give that amount of instruction as a minimum amount in a two-years' course of instruction; that it was conceded by everybody who was honest in their conviction that it could not be done. Mr. Beringer called attention to the preface of the book in which it was stated that educators and examiners could select what they wanted to teach. He thought it was very unfortunate to have such a statement as that in the preface; that the Association could not afford to place themselves in a position that was morally wrong, and they should not be asked to endorse a thing which could not be carried out. He also said he did not care to indulge in per-

sonalities and he hoped none of the gentlemen present would do so, but he thought the members of the committee would bear him out in his statement that a sane revision of the syllabus by the committee as at present constituted was impossible. He said he had attempted to contribute, and he thought he had contributed as much original and constructive criticism as any other two members, and in saying this he did not intend it as egotism; that some of the ideas which should have been incorporated in the syllabus were adopted, while others were thrown overboard.

The trouble with the committee, Mr. Beringer said, and he was going to speak plainly, was that outside influences had prevented the men who had the education and knowledge in regard to pharmacy from inculcating and incorporating in the syllabus what is a true representation of pharmaceutical education; that if the syllabus did not serve that purpose it had absolutely failed.

Mr. Beringer said he had spent a great many hours in preparing a list of titles to go in the list of reference books. When the book came out in print he was surprised to find page after page with mis-spellings and errors that he would be ashamed to admit having had anything to do with. He exhibited a sample page on which he had indicated some corrections, and said such a work was not creditable to the American Pharmaceutical Association, with page after page of mis-spelled titles; that the syllabus as printed did not contain the proper titles of the books and the authors' names were mis-spelled. He asked if the Association thought they should stand sponsor for a book as imperfect as this; and said that the trouble with the book was it had not been prepared by pharmaceutical educators. He asked, if they did not have sufficient intelligence in the American Pharmaceutical Association to outline a course of instruction, having among its members all these teachers from the colleges, where they would get it. He said they certainly would not get it from men who were not educated in pharmacy, and that the trouble was influence had been brought to bear upon pharmaceutical education by men who were not pharmacists, which was a great mistake made in the preparation of the book. His proposition, he said, was that the Council should take very carefully into consideration the advisability of preparing a Pharmaceutical Syllabus which would be expressive of the views of pharmaceutical educators. He said there had been a meeting of the Syllabus Committee held in Pittsburg, and they had met there with the unanimous agreement that the American Pharmaceutical Association should be asked to take over and publish or edit the future revisions of the Syllabus; that they had gone home with the idea that that was settled by the officers of the American Pharmaceutical Association; but, he stated, the work had never been presented to the Association and they had never been asked in Council or in general session to consider the unanimous result of that vote taken at Pittsburg, which was an expression of view of men meeting face to face and talking over the proposition; that it had been recognized at Pittsburg when they were together, that the American Pharmaceutical Association was the proper body to prepare and publish such a book, but when they got away the outside influences changed the whole thing and it had never been presented to the Association, and his idea was that they get it back again where it belongs, to the American Pharmaceutical Association, and act on it.

Mr. Mason said the strength, it seemed to him, of the present Syllabus was in

the fact that it had been revised by three co-ordinating bodies, the American Pharmaceutical Association, the American Conference of Pharmaceutical Faculties, and the National Association of Boards of Pharmacy, and he looked upon this joint work wholly apart from what the book might be as one of the most hopeful augurs in the development and history of American pharmacy; that the mere fact that they had these three agencies at work together, coöperating with and assisting one another, was most hopeful for the future of the calling, whether they got out the present book or any other book, or what they did. Mr. Mason said they could go to work and get up a Syllabus of their own if they desired to, and if they did not care to play in somebody else's yard; that they could get up a book, but who would use the book if the American Pharmaceutical Association got it up; could they expect the faculties to use it, or the boards to use it? He thought it was far better to work in coöperation with those agencies as they were now doing and get what they want by a compromise. He said no one was satisfied with the Syllabus, and no one could be satisfied with it; no one ever would be satisfied with any Syllabus that was gotten out by any one individual because a Syllabus, like a law, is the result of compromise. He called attention to the fact that there were twenty-one men working together and the Association could not expect to get every proposition adopted they wanted adopted. He had himself submitted a great many things that were not accepted, but he had no grouch as a result of their action, but was satisfied with what he did get through. He thought that the majority of wisdom ruled in the end, and said that much of the criticism that had been hurled against the Syllabus was the criticism of one man. He said he would not, as President Beringer had hoped they would not, indulge in personalities, but he thought it was proper for him to say that the Secretary of the Syllabus Committee had been criticised a good deal; that he was not going to defend anybody, and he was not going to defend the Secretary, but he simply stated the fact that he had been criticised for his autocratic methods and for perhaps having his ear to the ground. Mr. Mason said the old Secretary was no longer Secretary; that a new Secretary and Treasurer had been appointed that week, and they were sure to find in him as an officer of the Syllabus Committee everything they ought to expect.

Mr. Mason said in regard to the errors that Mr. Hilton and Mr. Beringer referred to, that there were errors found mostly in the back of the book, in a bibliography; that it was merely an appendix and possibly they ought to perform an operation and get rid of the appendix; that it was of no general consequence whether the names were spelled properly or not, and the book, as a whole, apart from the appendix, would stand a fair criticism.

Mr. Mason thereupon seconded Dr. Anderson's motion that they disapprove the recommendation of the committee; motion carried.

The Secretary then read the fifth recommendation of the Committee on President's Address:

"The recommendation of the President that a *special committee*, consisting of the President of the Association and the living former Presidents to report to the Association at its next meeting upon the subject of standardizing of pharmaceutical degrees, be approved."

Mr. Henry M. Gordin, of Chicago, moved that the recommendation just read also be disapproved; motion seconded.

Mr. Gordin said, in support of his motion, that they had already in the Conference of Pharmaceutical Faculties a body for standardizing or trying to standardize the pharmaceutical degrees; that they had not accomplished very much as yet, although they had been working for two years or more; that in this Conference all the schools were represented and that if they were to now throw over the work and leave it to a committee of the past presidents of the Association, with all due respect to that committee, he could not help but feel it would be at cross purposes and nothing would be accomplished. He impressed on them the fact that the matter of standardizing pharmaceutical degrees is a very difficult one, that each school had its own local conditions to meet, and that at present nearly every school is employing something different in the way of pharmaceutical degrees, and it was not easy for any body of men to standardize pharmaceutical degrees. Mr. Gordin suggested if it was not logical and reasonable that the thing could be done by a conference of pharmaceutical faculties where these schools are all represented better than by the American Pharmaceutical Association or a committee of the Association, in which the schools were not represented. Mr. Gordin strongly felt that the Conference of Pharmaceutical Faculties was the proper body to standardize pharmaceutical degrees instead of a committee of the American Pharmaceutical Association.

Motion carried.

The Secretary then read the sixth recommendation of the committee, which is as follows:

"Your committee regards favorably the proposition to create an Advisory Board consisting of the ex-Presidents of the Association to whom may be referred such subjects as the Council may direct for their report and decision."

It was moved by Mr. W. C. Anderson, seconded by Mr. William Mansfield, that the above recommendation be adopted; motion carried.

The Secretary then read the seventh recommendation of the committee, which is as follows:

"The recommendation is approved that this Association joins with other organizations in urging a modification of the postal regulations to permit the shipment of medicines by parcel post or through the mail, provided that such medicines are not of such a character as to damage the contents of the mail bag and of the class of habit-forming drugs."

It was moved by Mr. Jeannot Hostmann, of Hoboken, seconded by Mr. W. C. Anderson, that the above recommendation be adopted; motion carried.

The Secretary then read the eighth recommendation of the committee, which is as follows:

"We approve of the President's recommendation that a committee be appointed to prepare and introduce a new bill, at the next session of the Congress, improving the status of pharmacists in the army service of the United States."

Upon motion of Mr. Otto Raubenheimer, seconded by Mr. H. V. Army, the above recommendation was adopted.

The Secretary then read the ninth recommendation of the committee, which is as follows:

"Your committee approves of the recommendation of the President that some plans should be formulated for the protection of the public and for the prevention of accidents due to swallowing bichloride tablets or their solutions. Your committee is not united in the selection of a form and shape to be recommended, but

believe that this should be settled after a discussion in an open meeting of the Association."

Upon motion of Mr. Jeannot Hostmann, duly seconded, the above recommendation was tabled.

The Secretary then read the tenth recommendation of the committee, which is as follows:

"The recommendation of the President that the Year Book of the American Pharmaceutical Association be completed and published within a reasonable time after the expiration of the year which it represents, is approved by your committee."

Mr. H. V. Army then moved that the above recommendation be adopted; motion duly seconded by Dr. E. A. Ruddiman, and carried.

The Secretary then read the eleventh recommendation of the committee, which is as follows:

"The committee recommends that the suggestion of the President to continue the publication of the Code of Ethics in the Year Book be continued."

It was moved by Mr. H. V. Army, seconded by Mr. William Mansfield, that the above recommendation be adopted; motion carried.

The Secretary then read the twelfth recommendation of the committee, which is as follows:

"The Committee on Publication, in view of the publication of the Journal and other duties, require some addition to their clerical force, and the recommendation of the President is approved that the appropriation for the use of the committee be paid in quarterly sums in advance. It is further recommended that the Council take steps to give the Committee on Publication more extended power."

Mr. M. I. Wilbert moved that the recommendation be referred to Council for consideration as it involved the disposition of funds and he did not think it fair to Council to take action on the recommendation at that time. Motion seconded and carried.

The Secretary then read the thirteenth recommendation of the committee, which was as follows:

"The committee approves of the publication of an Epitome of the N. F. with the objects stated in the address, and that there be established a Committee on Propaganda with the object of increasing the use and extending the influence of the N. F. preparations."

Mr. M. I. Wilbert moved that the above recommendation be referred to Council with power to act. Mr. W. C. Anderson seconded the motion and asked Mr. Wilbert to add to his motion that it be referred to Council with power to act on favorable recommendation from the general session. Mr. Wilbert accepted the addition to his motion, and it was carried.

The Secretary then read the fourteenth recommendation of the committee, which is as follows:

"Your committee approves of the suggestion of the President that committees recommended by the various sections should be approved by the Council before assuming their duties."

Mr. W. C. Anderson said it seemed to him that the above recommendation would result in unnecessary work of the sections; that if the Chairman of a Section offers a report or delivers an address in which he makes certain recommendations which the Section chooses to refer to a committee, the Section could not under such circumstances choose its own committee; in other words, the

members of the committee would have to be O. K'd by the Council, and he thought the proposition was ridiculous and was a reflection on the members of the Section; that they had been trying to cut their business down during the present meeting and this proposition if carried, would result in hindering the despatch of business in the sections. For the above reason, Mr. Anderson moved that the recommendation be disapproved. Motion seconded and carried.

The Secretary then read the fifteenth recommendation of the committee, which is as follows:

"The recommendation of the President that a filling of vacancies in the offices of sections should be filled by the President when occurring *ad interim* is approved."

It was moved by Mr. W. C. Anderson, duly seconded, that the above recommendation be adopted; motion carried.

The Secretary then read the sixteenth recommendation of the committee, which is as follows:

"Your committee heartily approves of the recommendation of the President that more time should be given by the Nominating Committee when selecting candidates for the office of the Association."

It was thereupon duly moved, seconded and carried that the above recommendation be adopted.

The Secretary then read the seventeenth recommendation of the committee, which is as follows:

"We approve of the recommendation of the President that local branches of the American Pharmaceutical Association should nominate a member for the Council and that the Council itself elects or declines as in its judgment seems best."

Mr. England said he wished to call attention to the fact that Chapter 12 on local branches, Article 4, says: "Each local branch having twenty-five actual voting members shall be entitled to elect a member every three years who shall become and continue a member of Council of this Association for that time." He said they could not adopt the recommendation of the committee without changing the above by-law.

Mr. Anderson said the recommendation was out of order; that it conflicted with the by-laws of the Association, and he therefore moved that it be laid on the table; motion seconded and carried.

The Secretary then read the eighteenth recommendation of the committee, which is as follows:

"The recommendation of the President that the functions of the House of Delegates be restricted to the consideration of topics of general interest, is approved, but the committee believes that a special committee should be appointed to take into consideration the whole subject of the function of the House of Delegates."

Mr. England moved that the above recommendation be referred to Council; motion seconded and carried.

The Secretary then read the nineteenth recommendation of the committee, which is as follows:

"The recommendation that the Association should have its own committee on resolutions and that this committee should hold open sessions for their discussion is approved."

It was moved by Mr. H. V. Army, and duly seconded, that the above recommendation be referred to Council.

Mr. Nitardy then called attention to the fact that the above recommendation conflicted with a by-law.

President Beringer said he objected to the above motion; that it was not a farcical matter and was not a matter that should go to Council at all; that the committee had approved it and they had already adopted the suggestion.

Mr. Anderson contended it was a farcical matter, and they were taking up things that had already been decided upon and that these things ought not to be before them at all at that time.

A vote was then taken and the motion referring it to Council carried.

The Secretary then read the twentieth recommendation of the committee, which is as follows:

"Your committee approves the recommendation of the President to provide for auxiliary of women members who shall be eligible."

Mr. W. C. Anderson moved that the above matter be referred to Council; motion seconded by Mr. Jeannot Hostmann, and carried.

The Secretary then read the twenty-first recommendation of the committee, which is as follows:

"The plan recommended by the President for consolidating some of the sections as proposed in his address with a view of facilitating the business of the convention was also approved."

Mr. W. C. Anderson moved that the above recommendation be referred to Council; motion seconded and carried.

President Beringer then resumed the Chair and announced that the next order of business was the report of the Committee on the Recommendations of the Retiring General Secretary and Editor, and asked the Secretary to read the report.

The Secretary then proceeded to read the report of the Committee on the Recommendations of the Retiring General Secretary and Editor:

After due consideration, your committee begs to report as follows:

1. The recommendation of Secretary Beal with regard to the *publication of papers* belonging to the A. Ph. A., that *no* permission be given to allow the previous use of the papers by other journals, is approved. If a paper is presented to the A. Ph. A. and is accepted, then it is its property and the granting of permission to print such paper in advance would result in a loss of *property* to the A. Ph. A., and would diminish the value of this asset in proportion to the extent of the use of this privilege. This rule should *not* be modified except by a majority vote of the Council, in special cases.

2. The recommendation of Secretary Beal to the effect that members of the Association attending Council Sessions shall be permitted to speak at such meetings on invitation of the Chairman of the Council, be approved. This would, of course, require a change in the By-Laws.

3. The proposition to amend the By-Laws, Section 3, Article 8, of Chapter VII, be changed by striking out the requirement, that the names of candidates for membership be read at the General Sessions. There seems to be no necessity for this since the list of new members is printed and vised by the Council.

4. With regard to changing the By-Laws so that it shall not be necessary hereafter to read the minutes of the Council to the Association, your committee believes that it would *not* be wise to make such a change. Many members of the Association would feel that they were being deprived of information which they have a right to possess. In addition to this it must be a satisfaction and a safety check for the Council itself to know that all of its acts have been ratified by the parent body.

5. Here we believe that any member of the A. Ph. A. has the right to *call for a report from the Council on any matter* and the introduction of a new By-Law to Chapter VII is unnecessary. Notwithstanding the fact that time is required to read the minutes of the Council, the members of the Association should feel that nothing is held back by the Council which any member of the Association has a right to know.

6. With regard to the proposition which has been made to abolish the House of Delegates, your committee believes that there has not been sufficient time to prove its usefulness, and we recommend that a *Special Committee* of the Council be appointed by the Chairman to consider what changes are desirable in the constitution and function of the House of Delegates which may make it an important aid to the Association.

7. The proposition to have the House of Delegates composed only of Delegates of State Pharmaceutical Associations, is, in our opinion, a good one.

8. With regard to the continuation of the Section on Pharmacopœias and Formularies, your committee believes that by making this Section a sub-Section of another Section, this would still enable the Association to hear and discuss all matters relating to the subjects, and will carry out the idea of the late Prof. Oldberg. The multiplying of Sections, in our opinion, is undesirable for the reason that many of our best members find difficulty when meetings are held simultaneously of attending two or three Sections.

9. Your committee, in conclusion, recommends that in testimony of the unusually valuable services of the former Secretary and Editor, James H. Beal, that an honorarium of \$1000.00 be presented to him with the grateful thanks of the Association and with the expression of the hope that many years of usefulness be vouchsafed to him.

Respectfully submitted,

(Signed) R. H. WALKER.

J. S. L. LEMBERGER.

OTTO RAUBENHEIMER.

JOSEPH P. REMINGTON,

Chairman.

Mr. M. I. Wilbert said that several of the recommendations contained in the above report had already been adopted; that the concluding one involved the expenditure of money, and he thereupon moved that the report of the committee be accepted and referred to the Council for their consideration; motion seconded and carried.

Mr. Carter said along that line he thought it would be very unwise for the organization to adjourn without going on record with some definite resolutions in regard to the retiring Secretary, and he therefore offered the following resolutions which he would ask the Secretary to read.

The Secretary then read the resolutions above referred to, which are as follows:

WHEREAS, The conservation of his health has compelled our esteemed General Secretary and Editor, Dr. James H. Beal, to resign these offices that he has so acceptably filled, and,

WHEREAS, This Association is greatly indebted for his indefatigable efforts, zeal and energy along many lines of service to Pharmacy, and,

WHEREAS, His devotion, ability and integrity have endeared him to every member of the Association. Therefore, be it

Resolved, That the American Pharmaceutical Association accepts the resignation of Dr. James H. Beal as its General Secretary and Editor of the Journal of the American Pharmaceutical Association with sincere regret, and, be it

Resolved, That it extends to him the earnest hope, entertained by the entire membership, that the relinquishment of the arduous duties of these offices, will

result in a speedy improvement of his physical condition and that many years of active usefulness and happiness may remain as his portion in life, and, be it

Resolved, That to attest our appreciation of his services in behalf of the Association and of a progressive, ethical Pharmacy, it directs that these resolutions be entered upon the minutes of this meeting, published in the Journal of the American Pharmaceutical Association, and that the Secretary transmits a copy thereof to our beloved retiring officer.

Mr. Carter then moved the adoption of the resolutions by a rising vote; motion seconded by Mr. George H. Schafer, and unanimously carried.

President Beringer announced the next order of business was the consideration of matters coming from the Council. Mr. England announced there was nothing. The President called for matters originating from the different sections, and asked for the Scientific Section first.

Recommendation.—It is recommended by the Scientific Section that the American Pharmaceutical Association express to the Surgeon General of the Public Health Service, its appreciation of the publication of "Digest of Comments on the U. S. Pharmacopœia and National Formulary, and that it requests the continuance of this publication, if possible, more promptly.

It was moved by Mr. Nitardy and duly seconded that the above recommendation be adopted; motion carried.

President Beringer then called for the report of the Committee on the Formation of Local Branches. The report was then read by the Secretary. (Printed in September issue.)

President Beringer said if there was no objection the above report would take the usual course. He then requested the Secretary to read the resolution from the Committee on Pharmaceutical Faculties which had been referred to Council and by Council referred back to the general session. The Secretary then read the resolution as follows:

Resolved, That the American Pharmaceutical Association be requested to define a College of Pharmacy as an Institution, meeting the requirements of the Conference of Pharmaceutical Faculties.

It was thereupon moved that the above report be adopted.

Dr. Wulling said he thought if they adopted the report they would have a little trouble; that it was very difficult to define anything and they would be better off in the end if they did not define a college of pharmacy, and while the motion had been made to adopt the report, yet it had not been seconded, and if he was not out of order he would move that the report be disapproved.

Mr. Whelpley said the motion originated in the Conference following a discussion in which it became apparent that some legislatures looked to the American Pharmaceutical Association for a definition of a college; that the Conference defines a college, that is, defines those that are eligible for membership, and the adoption of this recommendation would be merely concurring in the action of the Conference of the American Pharmaceutical Faculties.

Mr. Arny thought, in view of the previous vote that had been taken, and which was not intended as any discourtesy to the Chair, but simply to bring out the fact that the technical educational subjects should be left to the Conference of Pharmaceutical Faculties, it would be inconsistent to now adopt this recommendation, and he therefore wished to express his disapproval of the matter, and seconded Dr. Wulling's motion.

Mr. Whelpley suggested that the motion of disapproval carry with it an explanation which should go to the Conference.

Dr. Wulling said he had been at one time on a University Committee to define certain terms, and they had found it was a very difficult thing to do, and he believed this Association at some of its previous sessions had been asked to go on record as defining a poison, which was a difficult thing to do; that they all had a general idea what a poison was and they all had an idea what a college was in a general way, but when it came down to specific legislation they were creating something that somebody else would surely find fault with some time or other. He had no objection to anyone going on record and stating that a college of pharmacy was so and so, but he believed there were too many difficulties in the way of formulating a definition and he hoped they would not now go on record as defining what a college is.

Mr. Army then moved as a substitute for Dr. Wulling's motion that the communication be returned to the Conference of Faculties with an expression of regret that the Association considers the matter not within the province of the American Pharmaceutical Association. The above substitute motion was seconded by Mr. Anderson. Mr. Wulling then withdrew his motion and the motion carried.

The Secretary then read the report of the Syllabus Committee, as follows:

To the American Pharmaceutical Association:—

The Syllabus Committee of your Association begs leave respectfully to present the following report of the year's activities:

At the meeting of the committee, held at Nashville, the final revision of the proof for the second edition of the Pharmaceutical Syllabus was completed and the Executive Committee instructed to proceed with the publication of the book. It was with profound satisfaction that the committee announced the completion of the revision on February 22, 1914, and mailed the first copies of the second edition April 13, 1914. A conference of the Indiana State Board of Pharmacy with the Indiana schools of pharmacy was then in session and Indiana has the honor of being the first State Board to approve and adopt the second edition. Indiana's example has been followed by Missouri, Florida, Massachusetts, New York, Ohio, District of Columbia, Tennessee, Delaware, Texas, Utah, Virginia, South Dakota and Oklahoma.

The action of the Indiana schools was soon followed by New York's Council. It answered the question, What may be involved by its adoption either by schools of pharmacy or by boards of pharmacy?—in the following quotations from the book itself:

Page 8, Line 9. "But a syllabus, like a living language, is necessarily in process of constant change. It must not be used to dam the flow of increasing knowledge either of fact or practice."

Page 16, line 1. "Definition. The pharmaceutical syllabus is prepared to indicate the general scope and character of the instruction to be given by the teacher and the work to be done by the student."

Page 16, line 10. "It is not designed, however, to interfere with such flexibility in courses of study and freedom in methods of instruction as ought to exist in pharmacy schools."

Page 17, line 36. "The syllabus is intended to allow the individual teacher or school the widest possible liberty as to order and grouping of these topics and methods of presentation. Its object is to specify what topics are to be taught by the schools, and expected by the boards without concerning itself with the manner in which this result is reached by any school, teacher or book."

Page 141, line 1. "The selection of the particular line of experiments to accompany a course of lectures upon pharmaceutical *technique* must necessarily be left largely to the judgment of the instructor, the choice of the latter naturally depending upon his opinion of the portions of the subject which need the emphasis of laboratory work."

Page 146, line 10. "Prepare the following official preparations and such additional U. S. P. or N. F. preparations as the time will permit, as far as possible selecting such additional preparations from those especially requiring skill and careful manipulation."

Page 149, line 4. "The time allotted for dispensing pharmacy should be arranged to give a liberal number of hours for actual work in the compounding of prescriptions."

A dean of one of the schools writes, "It is about time to stop the farce of legal qualification as pursued at the present time. A little knowledge may be better than none, but parrot answers will not elevate the professional standing of American pharmacy." That is, the time of the quiz has passed. Board members are now willing to relegate such to the dead past and to unite with the schools to place a prerequisite general and professional educational requirement on the statute books of all the states of the Union. When this is accomplished the way is open to a license valid for the practice of pharmacy throughout the United States. And the Pharmaceutical Syllabus is the leaven at work livening the whole mass of pharmaceutical education. The relations of boards and schools are more cordial. The opinions of earnest workers in both branches of the work are held in greater esteem. The fact that twenty-one men from Massachusetts to Washington, from Minnesota to Texas, could unite upon an outline and detail the same is sufficient evidence to warrant the opinion that the Syllabus is to become a great factor in pharmaceutical education in the United States.

First. It is the first Syllabus ever published of a national character. Its emblem typifies the fact. That 53 state boards and more than 75 schools of pharmacy could unite in the American Pharmaceutical Association in the organization of a National Committee, prosecute its studies through a period of years, and publish a book to be adopted by the schools of pharmacy, and by the boards of pharmacy, for the guidance of both in the preparation of students and their examinations, seems noteworthy.

Second. It is the first syllabus to stand the strain of revision under a reorganized committee. That the committee could agree upon courses of study, subjects to be found therein, detail outlines of time to be devoted to each in hours per week and weeks per year; could perfect a Syllabus of the treatment of the subjects, plan for their intelligent presentation, advise the adoption of modern methods with suitable equipment in laboratories and libraries, seems a work of no little magnitude and of far-reaching influence.

Third. It is the first Syllabus successfully published by a committee without the financial backing of a parent body. That this work could be issued without gift or bequest, without aid of advertisement, or personal contributions, and that the expenses of individuals were contributed without hope of return, seems the highest form of disinterested service.

Fourth. The copyright is owned by the committee. Every copy issued represents the disinterested effort and the personal funds of more than a score of workers from Massachusetts to Washington, from Canada to Cuba.

In the light of this report of progress your committee respectfully recommend:
First—The approval of the Syllabus by this Association.

Second—The annual appropriation of \$25 toward the expenses of the committee.

Respectfully submitted,

WILLIS G. GREGORY, Chairman.

JOHN CULLEY, Secretary *pro tem*.

Mr. W. C. Anderson moved the adoption of the above report; motion seconded by Mr. William Mansfield, and carried.

President Beringer said as a member of the Association he desired to have his vote recorded in the negative.

Mr. Anderson rose to a point of order, saying the President had no right to vote. The President stated he desired to have his vote recorded in the negative.

President Beringer called for the resolution from the Section on Pharmacopœias and Formularies.

The Secretary read as follows:

SECTION ON PHARMACOPŒIAS AND FORMULARIES.

This Section recommends that the general session appoint a committee of fifteen on the growth and collection of botanical drugs with a special view to making good the deficiencies in the supply due to the war in Europe.

Mr. William Mansfield moved that the above report be adopted; motion seconded by Mr. Hilton.

Mr. Mansfield said he thought the wording of the motion was a little ambiguous, but the intent probably was to study the kind of drugs which could be cultivated and report to the committee.

Mr. C. A. Mayo asked to be allowed to suggest that he wrote the motion and knew what he meant, and also assumed the responsibility for having written it, and there was an excuse for the Secretary's difficulty in reading it. That what they had meant particularly was the possibility of being able to collect from this year's crop of indigenous medicinal plants some drugs, even a partial supply of them, the supply of which had been cut off by the European war, and the recommendation involved also, the possibility of providing for future supplies in so far as they could do so; that there was great danger on the one hand that they would be cut off entirely from the supply of botanical drugs, and on the other hand, that the public who have an insufficient knowledge of the growing of medicinal plants may waste a great deal of time and energy in trying to grow plants which cannot be grown successfully. He stated further that the object of the resolution was to primarily collect any medicinal plants which were now growing and to provide against a deficiency caused by possible failure to collect the present crop in Europe.

Motion carried.

Mr. Day said he had been elected a member of Council for three years at the last general session and he saw no need of occupying two chairs in Council, and therefore desired to resign his position as Councilor-at-large, leaving a vacancy.

Mr. Clark moved that the resignation of Mr. Day be accepted, which motion was duly seconded and carried.

Mr. F. T. Gordon asked how the vacancy would be filled. Mr. Whelpley replied that it had been customary, under such circumstances, to elect someone at open session to fill the vacancies. He had in mind something that he had expressed previously more than once, that there should be some arrangement whereby the retiring president automatically became a member of the Council; that as things now were such was not the case; the retiring president is nominated for election, but it left a year's vacancy, which represented the most important year that he could serve. The retiring president, he said, had everything in hand and suddenly is dropped out of the Council, which procedure happened right along.

Mr. Whelpley said he would not take up the time discussing a remedy, but he would like to nominate Mr. Beringer to fill the vacancy.

Motion seconded by Mr. Roehrig.

Mr. W. C. Anderson moved that the nominations be closed and that the Secretary cast the affirmative ballot for Mr. Beringer. Motion seconded by Mr. Schafer, and carried.

The Secretary then announced that he had cast the ballot for Mr. George M. Beringer as member of the Council, to succeed Prof. Day, after which Acting President Apple declared Mr. Beringer elected to that office.

Mr. Whelpley then said he presumed that there was now a vacancy left in the list of nominees for the Council, and it would be in order to nominate some one for that vacancy. He thereupon nominated Mr. Mayo.

Mr. Day said it was perfectly right to take care of Mr. Mayo in the same way they were taking care of the retiring President.

Nomination seconded.

Mr. F. T. Gordon moved that the nominations be closed and that the name of Mr. Mayo be placed on the ticket of list of nominees.

Motion seconded and carried.

President Beringer announced they had very nearly completed the program, but there was one item that had been omitted from the first general session, namely, the reports of the delegates of the various bodies, and asked the pleasure of the convention as to the reports of the delegates of the National Association of Wholesale Druggists, National Retail Druggists' Association, National Association of Manufacturers of Medicinal Products, etc. He suggested that the delegates file with Council their written reports.

Mr. Gordon amended the suggestion by saying they be published if it was deemed desirable.

Mr. Mansfield incorporated these suggestions in a motion, which was seconded by Mr. Gordon, and carried.

Mr. Eugene G. Eberle, of Dallas, Tex., asked if there had been a committee appointed to extend a vote of thanks to the local committee and to the citizens of Detroit.

President Beringer replied there had not been but that the Chair would be pleased to entertain such a motion.

Mr. F. T. Gordon thereupon moved that the thanks of the American Pharmaceutical Association be extended to the local committee and to the firms which had aided so greatly in making their stay pleasant, particularly to Parke, Davis & Company, Frederick W. Stearns & Company, and to the Detroit druggists generally.

Mr. Eberle said he would like to offer as an amendment that they include the ladies in the motion. Mr. Gordon accepted the suggestion as a part of his motion.

Mr. Roehrig stated that as long as it did not involve the expenditure of money it was not necessary to refer it to the Council, and he would offer an amendment, that the hotel management be included in the vote of thanks for allowing the Association the privilege of using the Convention Hall. He said he did not think there was any extra charge for that.

President Beringer replied there was not so far as he knew.

Mr. Apple recommended that they include in the list of firms all the firms which had provided special entertainment, and include also a vote of thanks to the ladies.

One of the members then said they should also include in the motion a vote of thanks to the local press.

Mr. Gordon accepted the above amendments and suggestions as a part of his motion, and it was then seconded and unanimously carried.

Mr. Whelpley said they had elected a Permanent Secretary, but had not fixed his salary and, after consultation, he moved that the salary of the permanent Secretary for the ensuing year be fixed at \$750.00. He explained that the by-law provides that the salary shall not exceed \$1200.00 per year, so they were well within the provision of the by-law.

Motion seconded by Mr. Apple, and carried.

Mr. C. Lewis Diehl said he thought the success of the meeting was largely due to the very efficient services of the local Secretary, Mr. Seltzer, and he moved a vote of thanks be extended to that gentleman.

Mr. Wilbert, in seconding the motion, said he wished to bring to the attention of the Association that during the time he had been attending A. Ph. A. meetings this had been by far the most profitable meeting that he had attended. He said also he did not as a rule attend the meetings for the entertainment feature; but that from a scientific point of view they had been afforded better opportunities at the present meeting to attend to their business and profit by it than they had ever had at any previous meeting of the Association, and he therefore suggested that when the motion was put to a vote the members be requested to rise.

Th motion was then unanimously carried by a rising vote.

President Beringer then appointed as a committee to escort the newly-elected officers to the platform for installation, Mr. W. B. Day, of Chicago, H. M. Whelpley, of St. Louis, and John G. Godding, of Boston, and he requested that they conduct Mr. Caswell A. Mayo, of Brooklyn, to the Chair.

The committee then escorted Mr. Mayo to the Chair and introduced him to the President.

President Beringer said it afforded him unusual pleasure to greet Mr. Mayo as President of the American Pharmaceutical Association; that he was not new to them; that he had been tried and they knew his excellent worth. The retiring President said in honor of Mr. Mayo's election to the office of President, it became his duty to present to him the badge, which was the evidence of his office, and he believed that Mr. Mayo would maintain the office as pure as the gold of which the insignia was made, and that the office would be kept free and untarnished during his career as President.

Mr. Beringer said it now became his duty to extend to Mr. Mayo the emblem of authority, and said he hoped that he would have great pleasure during the year in enforcing that authority, and he could say that he also extended to him the hearty coöperation of every member of the Association.

Mr. Mayo, in responding, said he had the reputation of not being particularly modest, or easily abashed, but the contrary appeared on this occasion; that he had felt so nervous at the approach of the consummation of the highest honor that could be bestowed upon a pharmacist, that he had been constrained to write out

what he had to say lest his feelings should overpower him, and he should say too much. He said he had just been reminded by a very close friend immediately before being inducted into office not to emulate our distinguished Moose President by having an inaugural address of 28,000 words, and added that if he talked to the full extent of his heart, he believed he would talk to the extent of at least 28,000 words.

Mr. Mayo then delivered his address of installation.. (Printed in September issue.)

President Mayo then asked the committee to induct the Honorary President, Mr. George H. Schafer, of Fort Madison, Iowa, into office.

Mr. Schafer was escorted to the platform and Mr. Whelpley introduced him to the President, saying that while it was a great honor for Mr. Mayo to be President of the Association, he was not alone in the honor of the President's office, because he had associated with him an honorary President, and Mr. Whelpley said they had never before elected to office a person who had such a long record of work in the discharge of the duties of an office as Mr. Schafer; that in 1881 he became acting President and in 1914, consummated his work as honorary President, which was certainly a long term.

President Mayo, on behalf of the Association, welcomed Mr. Schafer, and said that he was quite sure that the members of the Association would profit by Mr. Schafer's long and arduous labors in behalf of the Association and of pharmacy.

Mr. Schafer said he was never more surprised in his life than when he was advised of the honor, and he was deeply moved, and appreciated it more than he could express.

President Mayo then asked the committee to induct the new First Vice-President into office, Mr. L. D. Havenhill, of Lawrence, Kansas.

The committee then escorted Mr. Havenhill to the platform and presented him to the Association, and to the President.

President Mayo said it gave him great pleasure to greet one of the most earnest workers of the Association as First Vice-President, and that it was a well-deserved honor which had been conferred upon him.

Prof. Havenhill said he was deeply moved by the honor which had been bestowed upon him, and he wished to assure the Association that he would endeavor to continue to serve the best interests of the Association, and to discharge his official duties to the very best of his ability.

Mr. Mayo said he wished to apologize for the absence of the Second Vice-President, Mr. C. Herbert Packard, of East Boston, Mass., and the Third Vice-President, Mr. Charles Gietner, of St. Louis, as they had been called away by the exigencies of the time-table.

President Mayo then asked the committee to conduct the newly-elected members of the Council to the platform. Mr. Beringer and Mr. M. I. Wilbert were escorted to the platform, and President Mayo said that the success of the American Pharmaceutical Association had been due to the conservative manner in which its affairs had been conducted, and that they had very wisely put the management of the affairs of the Association into the hands of the Council, and it was the excellent quality of the men composing the Council that had made the Association a success, and they were very fortunate in having Mr. Beringer and Mr. Wilbert,

who had taken such an active interest and done such excellent work in the Association, in the past, to serve them in the Council.

President Mayo then asked the committee to conduct the newly-elected General Secretary to his office, Mr. William B. Day, of Chicago. Mr. Day was escorted to the platform, and President Mayo said that the General Secretary needed no introduction as he was so well known and had served the Association so ably in the past.

Prof. Day said he was deeply grateful for the honor conferred upon him, and that he was not unaware of the duties the office carried with it; that he had had some little experience in Association work as Secretary of his state Association, although this was a much larger undertaking, and he would ask the Association for their assistance and forbearance in the conduct of his office.

Mr. C. Lewis Diehl, the re-elected Reporter on the Progress of Pharmacy, was then escorted to the platform, and presented to the Association, and President Mayo said it was unnecessary to introduce Mr. Diehl, as he was known wherever pharmacy was known, and he hoped Mr. Diehl would live for a long while and continue to occupy his office.

Mr. Diehl said he would make a very short address; that he would say to the Association that his work in the past would have to be the criterion of what he would do in the future; that at all times he endeavored to do his very best in the performance of the duties of his office.

President Mayo then announced that the newly-elected Treasurer would be installed. The committee escorted Mr. Whelpley to the platform, and Mr. Godding said it gave him great pleasure to introduce Mr. Henry M. Whelpley as their Treasurer.

President Mayo said he might be in error, but he was under the impression that he and Mr. Whelpley both were in attendance at the 1888 meeting; that he believed that was the first meeting for both of them. Mr. Whelpley replied that it was not his first meeting, and that he had attended his first meeting before that time. Mr. Mayo said he was an older man than he was then.

Mr. Whelpley said he would not at that late hour make a speech, but that he must say that from year to year he seemed to become more and more interested in the work of the office of Treasurer, and as he said to the Council when he was elected, he believed he really enjoyed the work. The only regret he had, Mr. Whelpley said, was that all of the members were practically paid up to date in their dues, and as they all answered his first communication, it deprived him of the mental exercise that was required during the first few years he held his office in devising a series of letters to send to delinquent members.

President Mayo said he was delighted to learn that the Treasurer had an interest in the funds of the Association; that of course interest is a very important part of the income of the organization, in regard to the invested funds.

President Mayo said it now became his duty to present a new officer to the Association, a man who had served them faithfully in emergency and done the work admirably, and he was very glad indeed to have an opportunity to voice the sentiment of the members of the Association of the sense of appreciation for the excellent service that had been done by Mr. E. C. Marshall, the Acting Editor,

who now assumed the post of Acting Editor of the Journal of the American Pharmaceutical Association.

Mr. Marshall said the announcement of his selection to fill this post came as a great surprise to him. He thanked the Association for the confidence they had shown in bestowing upon him this high office, and said as far as it was in his power, his entire thought and energy would be devoted to the service of the Association, and to the cause of pharmacy. The highest service of the Journal was to serve American Pharmacy, and as far as laid in his power his every effort would be devoted to the uplift and advancement of that end, and if he failed, he wished them to understand that it would not be because of any lack of effort, but it would be because the power to succeed had not been bestowed upon him. Mr. Marshall said he sincerely hoped that he would be able to fulfill all their expectations, and he asked, as he had asked in his first editorial, for the sympathetic consideration and help of every member of the Association.

Mr. Joseph W. England was then installed as Secretary of the Council. President Mayo said Mr. England needed no introduction, that he had served the Association long and well in the past and it was to be hoped that he would be able to continue to render such service for a long time in the future.

Mr. England thanked the Association for the honor conferred upon him and said he would endeavor to perform the work of his office to the best of his ability, as he had done in the past.

There being no further business before the Association, on motion duly made, seconded and carried, the General Session of the Association stood adjourned until the Annual Meeting of 1915.

MRS. FRANK H. CARTER,
Treasurer.

MRS. KITTIE H. GRAVER,
First Vice-President.

Minutes of Section Sessions

MINUTES OF THE SESSIONS OF THE WOMEN'S SECTION AT DETROIT.

The first session of the Women's Section was called to order on Tuesday at 9:30 a. m., by the President, Mrs. John G. Godding, in the parlor of the Hotel Pontchartrain.

The Divine blessing was invoked by the Reverend Dr. Pence of the Second Presbyterian Church of Detroit.

Mrs. Harry Kingsmill, of London, Ontario, furnished musical selections.

Greetings to the women of the convention from the Detroit hostesses were extended by Mrs. J. H. Webster, Chairman of the Ladies' Entertainment Committee. The response was given by Mrs. G. D. Timmons, of Indiana.

The Second Vice-President, Mrs. M. M. Gray, of Illinois, took the chair during the delivery of the President's address.

ADDRESS OF THE MADAM PRESIDENT.

MRS. JOHN G. GODDING.

With joy filling my heart I greet you to the meeting of the Women's Section.

Our appreciation of the privilege of coming to this fair city, "The Goddess of the Inland Seas," is more than I can fittingly express. We come to you bringing a warm clasp of friendship, not as strangers, but as kinsfolk, for some of us come from the ancestral homes of your forbears. From these pleasant surroundings to which you warmly welcome us, we shall be loth to depart, for I predict that at the close of this week we will be singing in unison, "Michigan, My Michigan."

We count it as an inestimable privilege to be known as members of a Section of this honored Association, the peer of any of its class in the world, a power for pharmaceutical development. We are grateful to it for their acceptance of us as a part of their organization.

The objects of this Section are to emphasize the right and capability of women to engage in pharmaceutical pursuits as a means of livelihood; to unite the women employed in Pharmacy for mutual encouragement and assistance; to labor for the improvement of legislation regulating the registration as pharmacists of women employed in the practice of Pharmacy in hospitals and other public institutions; to unite the women members of the A. Ph. A. and the women of the families of members of the A. Ph. A. in a section for social purposes and to coöperate in the promotion of the general progress of Pharmacy and of the American Pharmaceutical Association.

To all fair-minded persons the Women's Section has fully justified its being. The record of its work accomplished; the zeal and earnestness displayed by its members in effecting their permanent organization amid the torrid conditions of Nashville, and the creditable program which they arranged, all attest the wisdom of its establishment. To the present time it has secured twelve members as accessions to the Association and four of these were secured by a non-professional woman. The underlying purposes for the formation of this Section seem so vaguely understood that it seems well to quote from one high in authority in regard to this subject.

"It was believed that the creation of a Section of this kind would give more

formal recognition to the ladies who so regularly attend the convention and are so loyal to the A. Ph. A. principles. It is also the opinion that a Section of this kind can accomplish more for the women than the independent organizations, because the Section will have behind it all the influence of the A. Ph. A. and the prestige of its sixty years of history. It is also thought that such a Section would afford an opportunity for emphasizing the fact that women have a definite place in Pharmacy and are as much to be heard in pharmaceutical affairs as are the men, which has always been the attitude of the A. Ph. A."

The Women's Section desires to share in making the A. Ph. A. all that is possible in the way of an organization useful to Pharmacy. We know the A. Ph. A. is the only national organization in which all pharmaceutical interests meet. There is no distinction between clerk and proprietor, jobber or manufacturer, chemist or teacher, and even editors are given a hearing. As has been often said,

MRS. JOHN CULLEY,
Madam President.

MRS. H. M. WHELPLEY,
Second Vice President.

"The A. Ph. A. is the great clearing-house of Pharmacy." Into these opportunities and possibilities of this wide domain, the women have been counted worthy to enter. We realize that the best things can only be secured by united and concerted action. There is something wonderful in the power which organized effort can develop. The Women of this Section appreciate in the highest degree the distinction conferred by the Council in christening it "The Women's Section," and their greatest ambition is to make it a useful part of the parent Association, by directing the attention of women pharmacists to the quality and character of work this Association is accomplishing, and to use every avenue of influence open to them in extending its work. Our women can do important work that cannot be relegated to any other Section, a work so far-reaching in its influence that we may prove a mighty factor in the future of the Association. Carlyle said, "Give a thing time to grow. If it can succeed it is a good thing." Organization at large range is extremely difficult. We cannot accomplish everything in a day or a year, but we can do it if let alone. The present urges us to renewed zeal and the future beckons us to that success, which, though

" 'Tis not in mortals to command.

But we'll do more, Sempronius, we'll deserve it."

In Pharmacy women are succeeding, partly because of their genius for real hard work.

Statistics of influence can never be compiled. Each year brings promising information of young women who are entering the various colleges of Pharmacy, and of their being eagerly sought for responsible positions. The trend of the time is toward an active demand for women as pharmacists in Hospitals, State Food and Drug Laboratories, by Boards of Health as analysts, as well as for teachers in Colleges and in the retail drug business.

The Women's Pharmaceutical Associations on the Pacific Coast, New York, Chicago and Louisiana, each one "a live wire" in promoting the interest of Pharmacy, are signal lights to arouse women to the advantages to be derived from concerted action.

"The world bestows its rewards, both in honors and money, but for one thing and that is Initiative," or the doing of the right thing without being told. But next to doing without being told, is to do when you are told once. It seems to me the Women's Section was created to work as do the other Sections, for the betterment of Pharmacy, along the lines and in the way women are privileged to arrange and conduct their sessions.

The scope of the Women's Section will lead to the establishment of new ideas and new ideals, and *Ideals* lead the world. Ideals live though men die. We should urge all women pharmacists, as their bounden duty to become members of the A. Ph. A., and to assist in increasing its active membership. If we have not accomplished tangible results in proportion to our efforts, we are large in hope, in an increasing belief in the value of Pharmacy for women, and that better things are yet to come. The Women's Section hopes to build its organization so substantially and to become so true a helpmate, that it will be the one indispensable Section of the A. Ph. A.

I consented to be your President for what may have seemed a second term, because we only organized at Nashville. I have kept just a little in advance of you, but at the close of this Convention I shall fall back, to walk side by side with you in the ranks, pledged "to keep step" in all your efforts for the advancement of your work. In retiring from the office of President I wish to express my appreciation for the high honor tendered me and the trust reposed in me by the President and Council who appointed me your first leader. To thank also the Officers of the A. Ph. A., the pharmaceutical press and all members who have assisted and encouraged this Section in its beginning. We bespeak your coöperation for our successors and faith and hope in us. I would express my appreciation for the coöperation of my Officers and Committees and to the Secretary who has been "a tower of strength."

I wish I could stir up in your minds a realization of the great opportunity set before you who are to follow in the path which we have broken. "'Tis not for me to prophesy. It is the young who must see the vision and follow it. The old may but dream dreams." Take this resolution home with you:—that when we return we make renewed efforts not only to disseminate the knowledge of the deliberations of this meeting but earnestly strive to further the aims and purposes of this grand Association which we are proud to serve.

REPORT OF THE SECRETARY.

Your Secretary has no detailed report to make, beyond the usual work of the office. The correspondence and coöperation with the standing committees constitute the most of the duties of this office and the work of those committees will be reported by the several chairmen.

ANNA G. BAGLEY, Secretary.

REPORT OF THE EXECUTIVE COMMITTEE.

Owing to the absence of Mrs. Claus, Chairman of the Executive Committee, the work has fallen upon the other members and, though we have done the work

gladly, I am not sure that we have accomplished all that we might. At any rate we have little to report.

During the time that has elapsed since the meeting at Nashville no special business has been brought to our attention and our work has been mostly an effort to obtain papers for this program. A good many requests were made but few responded. Lack of responsiveness may be due to the way the appeal was made or in some other way the fault of the committee.

One thing I have felt particularly and that is the necessity of interesting wives of druggists. This Section was not created primarily for women pharmacists, and we should never have a large part in the program. Owing to my limited acquaintance with women members who are not pharmacists I have been unable to do much in that direction.

ZADA M. COOPER.

The Membership Committee submitted the following:

The Membership Committee has secured a total of twelve members during the past year. Individual reports have not been submitted by all the members. Miss Henkel of Chevy Chase, Md., reports as follows:

"I have to report that I have written 100 letters in an endeavor to obtain new members for the American Pharmaceutical Association. Fifty of these were addressed to women pharmacists and fifty to men, not only in the district allotted me, but also in Ohio and Missouri. I am very sorry to say that thus far I have not had a single response."

Through the Secretary's office a general knowledge has been gleaned of the efforts made by this committee, all of whom observed the rally-days set aside by Chairman Packard, writing from 25 to 50 letters each. The committee feels that this is good work, and like all other advertising, will have its effect in future work along this line.

The report of the Chairman's work in District Number 3, comprising Ohio, Indiana, Kentucky, Illinois, Michigan and Wisconsin, is as follows:

Eighty copies of the Proceedings of the Women's Section were mailed to women graduates of the two colleges of pharmacy of Chicago, to women pharmacists of the city of Chicago, and of the State of Illinois. A personal letter, giving the objects and aims of the A. Ph. A. and of the Women's Section especially, were mailed to each of 40 of the above-mentioned 80, and ten personal interviews were obtained; all of these young women expressing themselves as very much interested in the Women's Section, and when circumstances permitted promised to become members.

Only two copies out of the 80 copies of Proceedings sent out were returned marked "Not Claimed." These two copies were promptly re-addressed and sent to two prominent women pharmacists who for some reason had let their memberships in the A. Ph. A. lapse.

Your Chairman has the promise of one member, now resident in the State of Idaho, and has secured the memberships of two,—one a resident of Oak Park, Ill., having charge of the Pharmacy in one of Chicago's large hospitals for women and children, and one in charge of the pharmacy department in a hospital in Atlanta, Ga.

According to the latest statistics obtainable, your Chairman finds that there are, in the State of Ohio, sixty-seven women pharmacists, with but seven of these, members of the A. Ph. A. Illinois has ninety-three registered women, and thirty assistant registered women pharmacists, with but five of them members of the A. Ph. A. Kentucky has thirty-two women pharmacists, with not one woman member. Indiana has seven women pharmacists, with not one of these a member. Michigan, nine women pharmacists and one a member, and Wisconsin sixty women pharmacists, with one member, making a total of two hundred and ninety-eight women pharmacists in the six states of this district, with but fourteen of these who are members of the A. Ph. A.

What is true of District No. 3 is probably true of all other districts—truly, the next membership committee has a large field to work upon.

Since our last meeting—August, 1913,—your Chairman has gathered and compiled a list of the names and addresses of over three hundred women pharmacists from various sources—the personal items mentioned in the several Drug Journals, and the Druggists' Directory, etc. This list has been turned over to your Secretary for her files and for future reference.

MRS. M. M. GRAY, Chairman.

The Press Committee reported as follows:—

Madam President and Members:—

In January, 1914, the Secretary notified me of my appointment as Chairman of the Press Committee.

I am deeply gratified for the honor and regret my inability to make a complete report of the work accomplished.

I addressed a communication to each member of the committee asking their coöperation and items of interest to the Section. I regret that but one reply and one newspaper clipping was received during the entire year.

We are very grateful to the Secretary for carrying much of the work and responsibility of this committee the past year.

As a delegate from the Women's Section to the Utah Pharmaceutical Association, I had an opportunity to speak of the Women's Section and made a plea for a state organization. I have also forwarded to the Secretary a paper read before the Utah Association by Mrs. Wynn Eddy, the wife of a pharmacist.

The Women's Section of the A. Ph. A. has been getting a great deal of publicity in various drug journals and especially the Journal of the A. Ph. A., which items are too numerous to mention in this report.

ELIZABETH H. CULLEY, Chairman.

The Chair appointed as Nominating Committee, Miss Elizabeth Jenkins, Chairman; Mrs. E. A. Ruddiman, Mrs. G. D. Timmons, Mrs. William B. Day and Mrs. George F. Payne.

Mrs. Kingsmill sang several selections.

SECOND SESSION.

The second session of the Women's Section convened at 10 o'clock Friday morning.

President-elect Mayo of the A. Ph. A. claimed the privilege of presenting the Women's Section with a gavel, which offer was promptly accepted with thanks.

Mrs. G. T. Chamberlin, of Hartford, Mich., President of the Michigan State Federation of Women's Clubs, brought the greetings from 18,000 federated women in Michigan to the women of A. Ph. A.

Mrs. Herman Neuhooff, of Detroit, accompanied by Miss Harriet Ingersoll, furnished the music for this session.

Mrs. Chamberlin addressed the Section on "What Druggists' Wives Can Do to Raise the Standard of the Profession."

Chairman Zada M. Cooper, presented the following papers:—

"First Aid to Druggists," by Mrs. Wynn L. Eddy; "The Drug Habit and Its Bearing on Pharmacy," Anna B. Schlumberger; "The Views of a Woman Pharmacist," Mrs. I. A. Anderson, and "Sunday and Early Closing," Mrs. R. L. Thompson.

The Secretary read the following communication:—

The Women's Organization of the National Association of Retail Druggists extends to the Women's Section of the A. Ph. A. a cordial greeting and expresses the hope that your meeting will be a satisfactory and a successful one, and that the high aims of your Association may be fulfilled. With best wishes to officers and members, we remain,

Yours sincerely,

MRS. JESSIE F. WATERHOUSE, President.

MRS. NELLIE FLORENCE LEE, Secretary.

Also greetings from Mesdames Clarissa Roehr and Bruce Phillip, of San Francisco, both of which expressed the hope that the Association would hold its 1915 meeting in that city.

The Committee on President's Address reported its approval of the ideals and hopes expressed in the address of the Madam President, and heartily approves its recommendations. The Committee on Resolutions expressed its great sorrow at the passing-away of Mrs. J. M. Good of St. Louis and tendered sincere sympathy to her bereaved husband and family. It discussed the work of women not alone in the Association, but in the larger work of the world and extended the warmest thanks of the Section to the Detroit Committee, to President Mayo for his gift of a gavel, and to Mesdames Chamberlin, Kingsmill, Neuhoff and Ingersoll and to those who contributed papers to the meeting.

The following were elected as officers for the ensuing year:—President, Mrs. John Culley, Utah; Hon. President, Mrs. S. A. D. Sheppard, Boston; First V. P., Mrs. Kittie Harbord Graver, Penn.; Second V. P., Mrs. H. M. Whelpley, Missouri; Third V. P., Miss Jean Gordon, Illinois; Historian, Mrs. George B. Kauffman, Ohio; Treasurer, Mrs. F. H. Carter, Indiana; Secretary, Miss A. G. Bagley, Ohio; Member Executive Committee for three years, Mrs. John G. Godding, Massachusetts; Membership Committee, Mrs. M. M. Gray, Misses Alice Henkel and Mary L. Creighton, Mrs. C. T. P. Fennell and Mrs. C. A. Stover.

MRS. GEO. B. KAUFFMAN,
Historian.

MRS. JOHN G. GODDING,
Executive Committee.

MINUTES OF THE SECTION ON PRACTICE OF PHARMACY AND DISPENSING.

The opening session was called to order by Chairman Nitardy at 2 p. m., on Wednesday, August 26.

The Chairman, in his preliminary remarks, requested the lenient judgment of the members in his work for he had been in the care of a physician since May 15, and had only recently obtained his permission to be present at the Convention. At the conclusion of his opening remarks he asked Asso. Chairman Becker to take the Chair during the reading of the Chairman's address. (Printed in September issue, P. 1309.)

When Mr. Nitardy had concluded his address, on motion of Prof. Hynson, the following gentlemen were appointed to consider its recommendation:—Messrs. Hynson, Raubenheimer and Weinstein.

Mr. Nitardy then resumed the Chair and called upon Prof. Hynson to read a paper entitled, "All-Fool's Day at the Dispensing Counter."

Prof. Hynson prefaced the reading of his paper by referring to the recent agitation for the abolishment of the Section. Every once in a while, he said, some one, who perhaps had never attended one of the sessions, advocated its abolishment. But, speaking from his personal experience, he thought this section one of the most useful of all those of the Association. Before its establishment he had found it difficult to get in touch with the meetings of the Association. The Scientific Section was "over his head," and at meetings of other sections matters were discussed of no vital interest to him as a retail pharmacist, and it had taken him three years of persistent work to establish the fact that, in retail pharmacy and dispensing there was enough actual science, art and knowledge to require the establishment of this Section. With that idea as his inspiration he had attempted in his paper to show the need of science, art and knowledge at the prescription-counter. The selection of All-Fool's Day was in consequence of its being between seasons, and also that it might be a day with a little nonsense in it. (Printed on P. 1537, with discussion.)

Mr. F. M. Apple read a paper entitled, "What Constitutes Good Prescription Service?" This was followed by the reading of a paper by Prof. Ed. Kremers on, "The Incompatibility of Chloral Hydrate and Potassium Bromide in Hydro-Alcoholic Solution."

Mr. Apple contributed a paper entitled, "Filling Capsules—A Suggestion." (Paper and discussion, P. 1562.)

Mr. Cornelius Osseward was called to read a paper on "What Percent of the Prescriptions Dispensed in Your Store Can You Conscientiously Declare to be Dispensed with Fresh Drugs and Chemicals?" (Paper and discussion, P. 1554.)

Prof. Army contributed a paper entitled, "The American Institute of Prescriptionists." Paper and discussion, P. 1542.

Mr. C. P. Beckwith read a paper entitled, "The Pharmacy of Adrenalin." (P. 1547.)

The Chairman then called for the regular order of business, the nomination of officers for the ensuing year, and the following gentlemen were nominated:—Cornelius Osseward for Chairman; Irwin A. Becker for Secretary, and D. S. Jones for Associate Chairman. Adjourned until Thursday at 9:30 a. m.

SECOND SESSION.

In his opening remarks, Chairman Nitardy called attention to the fact that it was a joint session with the Michigan State Pharmaceutical Association and he invited the officers of that Association to seats upon the platform. The election of officers for the Section was then held, and the gentlemen nominated at the previous session were elected as the officers of the Section.

Mr. Nitardy then read a paper entitled, "A Plea for Reform in the Dispensing of Ointments and Similar Preparations."

Mr. F. M. Apple read a paper by Charles H. LaWall entitled, "A Formula for a New Type of Antiseptic Solution."

Mr. Kimmich contributed a paper on "The Deterioration of Galenicals."

Mr. Caswell A. Mayo read a paper entitled, "The Accuracy of Clinical Thermometers."

The Committee on Chairman's Address reported as follows:—

REPORT OF THE COMMITTEE ON ADDRESS OF THE CHAIRMAN.

After a very careful consideration of the excellent address of Chairman Nitardy, which should be carefully studied by every pharmacist, your committee begs to present the following report, which approves of the recommendations herewith presented:

1. *Preservation of Records.* There is no question that the records of the Section on Practical Pharmacy and Dispensing should be preserved and should be available for the future officers.

2. *Compilation of a Mailing List.* Such a list should be compiled especially of those members who take an interest in the Section so they can readily be reached.

3. *Formulation of a Set of Questions.* No doubt the symposium which has been arranged by Chairman Nitardy will be a record breaker in the history of the Section and should be kept up each year.

4. *Systematic Research on Practical Pharmacy.* Above all, this should be done as there are very many questions which come up in the daily practice of the Pharmacists that need further investigation, and should be solved.

In conclusion, we ask every member to study the address of the Chairman very carefully and to help to assure the success of the Section on Practical Pharmacy and Dispensing, which is the Section for the practical Pharmacists.

Respectfully submitted,

JOSEPH WEINSTEIN.

OTTO RAUBENHEIMER.

HY. P. HYNSON, Chairman.

And on motion the report was adopted.

Mr. Wilbert addressed the Section on the work of the American Medical Association and in connection therewith exhibited several of its publications, and commented upon their usefulness to pharmacists and to physicians.

Mr. Hall read a paper entitled, "A New Antidote for Corrosive Sublimate Poisoning."

Adjourned to meet at the call of the Chairman.

Reports

REPORT OF THE COMMITTEE ON PATENTS AND TRADEMARKS.

To the Officers and Members of the American Pharmaceutical Association your committee respectfully present the following report:—

Degradation of the Materia Medica:—The skeptical attitude assumed by leading physicians and teachers of medicine, during the past quarter of a century, is responsible in great measure for the neglect of materia medica by the medical colleges and inadequate knowledge of drugs as remedial agents on the part of the medical profession. To such extent had this therapeutic nihilism reached, that it was said of the medical societies, "If any daring member has introduced a subject bearing on medical treatment, it has been with an apologetic air and humble mien, well knowing that if his remarks had any reference to the utility of drugs in the treatment of disease they would be subjected to good-humored banter, and received by those sitting in the seat of the scornful with amused incredulity."

Rehabilitation of the Materia Medica:—We are informed by Prof. W. A. Puckner, Secretary of the Council on Pharmacy and Chemistry of the American Medical Association, that the report of the Board of Trustees made to the House of Delegates at the last annual meeting, (held in Atlantic City) does not bear out the statement that drug nihilism is rampant in the medical profession at the present time.

This change in the attitude of the medical profession, is very gratifying to those of us who are lovers of the pharmaceutic art, and we hope to see pharmacy elevated to its proper position as a branch of medical practice as the final result. Pharmacy, or the art of selecting, preparing, preserving, compounding and dispensing medicine, to meet the requirements of a rational drug therapy, is dependent upon the medical profession and a fountain can rise no higher than its source.

This change in attitude, is doubtless, largely due to the constructive work of the Council on Pharmacy and Chemistry of the American Medical Association. The Committee on Therapeutic Research and the Committee on Useful Drugs, are making progress in a way that holds out hope for the pharmacy of the future. But to secure the full benefits of this work, pharmacists and manufacturers must coöperate with the Council in its efforts to rehabilitate a rational materia medica.

The rehabilitation of the materia medica, is inhibited by our irrational patent and trade-mark laws, which permit the inventor of a new chemical substance, medicine, or food product, to patent the product, patent the process, and register as a trade-mark the name by which it is to become afterward known and dealt in. By this plan it is hoped, by the "proprietary" medicine manufacturers, to establish a system of perpetual monopoly in place of the seventeen-year monopoly permitted under the patent law.

In marked contrast to this system is that adopted by Germany and most foreign countries, where no product-patents are allowed, only process-patents, and where no trade-mark law stands in the way of competition between the manufacturers of the same products, who are free to deal in them under their currently-used names, when they succeed in discovering improved processes for preparing them.

Suggested Points of Patent Law Revision:—Our patent laws need revising in at least three important particulars. First,—the law should except from patent-protection, chemical substances, medicines and foods, the same as is done in Germany and most foreign countries. Processes only should be patented, leaving the products open to competition under their currently-used names. However, if

the patented process relates to a new product hitherto never produced, all substances of like nature should be considered as having been made by the patented process until proof to the contrary is given. This is the provision adopted by the German patent law.

It has been stated that such a law would be unconstitutional in this country, because the burden of proof in case of infringement rests upon the complainant, it being assumed that the defendant is innocent until he is proved guilty. This objection is evidently groundless, as President Taft, known to be a competent constitutional lawyer, in one of his last presidential messages, requested Congress to so amend the patent laws as to throw the burden of proof upon the would-be infringer.

Second:—The patent law should provide that the inventor of a process for the production of a new product, shall provide the new substance with a name which shall appear as the principal title in the application for patent, and shall also be used as a principal title on all labels, in all advertisements and in all literature published by the owner of the patent, his heirs and assigns.

Third:—The patent laws should be so amended as to except the patenting of aggregations or mixtures of drugs, or, in other words, ready-made prescriptions. In Caffall M. S., Vol. 16, p. 22, we learn that the Board of Examiners in Chief of the U. S. Patent Office, finally decided in relation to such mixtures, that "it was never intended that any composition of matter or mixture of simples should be the subject of monopoly. If Rhubarb and Senna, or Calomel and Jalap, were for the first time put together, he who should do it, whether regular practitioner or quack, would not be an inventor or discoverer under the law. If done by a physician, it would be only the exercise of ordinary professional skill; if by another, it would be but an ignorant jumble of things, having supposed virtues and benefits to be obtained by the union of known drugs."

Yet, in spite of this decision, which seems to have been salutary for a time, the patent office has returned to the practice of granting patents for ready-made prescriptions, as will be noted by referring to United States Patents Nos. 1,081,069, 1,086,193 and 1,086,900, which are essentially for simple mixtures of substances to which the Council on Pharmacy and Chemistry has objected, and so far objected rather effectively, because at least several applications for patents along similar lines have been since refused.

It is evident, therefore, that the patent laws should be so amended, as to prevent further transgressions of the principle underlying the law, which requires that inventions to be patentable shall be inventions in fact, and not mixtures of old and well-known drugs claiming special new therapeutic virtues not in fact possessed.

Physicians' "Proprietaries":—The manufacturers of this class of products have possibly done more to divert the practice of pharmacy and the prescription business away from the retail druggist, and centralize both in the great manufacturing houses, than have the manufacturers of synthetic chemicals. They have been aided in this by the general practitioners of medicine throughout the country, who, on account of their ignorance of prescription writing, have relied upon the skill of the manufacturer to produce elegant pharmaceutical mixtures, rather than upon their own ability to write prescriptions. Many of these ready-made compounds are just as worthy a place in the U. S. P. or N. F., as the compound pharmaceuticals now contained therein. But none of them should be subject to patent protection, unless displaying in their make-up greater skill than naturally is to be expected from skilled pharmacists, chemists and physicians, in the ordinary practice of their respective vocations.

As just stated, for a time the Patent Office refused to grant patents for ready-made prescriptions, on the ground that no greater invention is shown by their inception than should naturally be expected from skilled practitioners.

Objectionable Proprietary System:—A new method of protection was there-

fore evolved, known as the "proprietary system." It consists of coining a name for a medicine and registering it as a trade-mark. The name is not used as a trade-mark, however, that is, as a mark to distinguish an article from another *brand* of the same article, but is employed as a name to distinguish one article from another. This is not in keeping with the intent of the trade-mark law, but competitors let it go at that, for law-suits cost money; and, besides, manufacturers and retailers of medicines generally are doing the same thing.

The trade-mark law should be so amended, as to prevent the registration of names of medicines as trade-marks. Long ago, Commissioner of Patents Seymour told your Chairman that he believed the time would come when the Government would refuse to register words as trade-marks, because of their misuse afterward. Mr. George H. Lothrop, of Detroit, who in his day was one of the leading patent and trade-mark lawyers in the United States, in a letter addressed to your Chairman, dated October 5, 1894, says: "It has always seemed to me that the great evil of the proprietary system, lies in the ability of ingenious and wealthy advertisers, to delude a large portion of the public into buying their wares at exorbitant prices. In several cases I have forced a disclosure of the cost of these proprietary medicines, and have generally found that the largest manufacturing cost was the bottle and the label, and yet, by expensive and persistent advertising, the stuff is sold at retail for from 75 cents to \$1.00 a bottle.

"The objectionable features of selling an article like this under a trade name, will probably in time be corrected by the courts, for I believe that they will eventually hold that where a man makes a new article which has no proper name, or a common appellative, and gives it a name by which it alone is known, he cannot hold an exclusive right to that name, under the law of trade-marks. If I am right in this position, then anybody will have the right to sell a proprietary medicine under its one name, and trade-mark rights will be restricted to names which either contain the name of the manufacturer or consist of some fanciful title which leaves the common appellative open to the public."

A Remedy for the Misuse of the Trade-Mark Law:—There is a remedy for the misuse of the trade-mark law as applied to patented *materia medica* products worthy of consideration in this connection. Take, for example, saccharin as listed by the house of Merck & Co., in Merck's Index. The patent for Benzoyl-sulphonic Imide, having expired, the name "saccharin," although claimed as a trade-mark, had by the decision of the Supreme Court of the United States in the Singer Sewing Machine case (1895), become common property. Merck & Co., recognizing this fact, listed the product in the *Index* under the name *Saccharin* and then added, as synonyms, the other chemical names, and all the so-called trade names under which saccharin is known, as follows:

"Saccharin Merck-Refined; Benzoylsulphonic Imide; Garantose; Glusidum; Gluside; Glycophenol; Glycosine; Saccharol; Saccharinol; Saxin; Sykose; Zuckerin; Glusimide; Agucarina; Toluolsüss; Anhydroorthosulphaminebenzoic Acid; Benzosulphinide (U. S. P.); Neo-saccharin; Saccharinose.

It is evident that when saccharin is prescribed under any of the trade names Merck & Co. consider it perfectly legitimate for the pharmacist to dispense "Saccharin, Merck-Refined."

What should prevent the application of the same rule to unpatented *materia medica* mixtures? Why should not each manufacturer and retailer have his own brand of the same thing, and use the names of all competing brands on his label as synonyms?—that is, of course, if the secret of the composition of the article has been divulged. In that case each manufacturer might use his own name, firm name, or initials, for pointing out his brand, as "Saccharin-Merck," or Fluid-extract of Cascara Sagrada, P. D. & Co., or Diphtheria Antitoxin, Mulford.

Secret Nostrums:—There is still another class of so-called proprietary medi-

cines concerning which there is much to be said in objection, and that is the secret nostrums falsely advertised to the general public as specific or cures.

If the public is to be its own doctor, people should at least know what they are buying as medicine, and should be protected from paying more for medicines than they are worth. What would happen if a law were passed forcing the manufacturers to disclose the formulas of their widely advertised products and confine their statements in advertising to the truth? It would put an end to the sale of some of the "proprietarys," but those worthy of survival would live and thrive. Probably the demand for the worthy would increase because of less competition and because confidence in their virtues would be gained by knowledge of their composition.

Your committee can readily imagine the shock that will be produced on the minds of the "proprietarys" on reading such a suggestion. In their opinion such legislation is confiscatory. "Every little druggist will make an imitation of our medicines and substitution will ruin our business," is the reason given for opposing such legislation.

Let us stop a moment and consider this question of confiscation. Where did the manufacturers of these "Proprietarys," get their formulas? They have already answered that question in part. You will find this partial answer in the "Petition of the Proprietors of and Dealers in Proprietary Medicines," addressed to the United States Congress and read at the annual meeting of the "Proprietary Association of America," St. Louis, Oct. 17-20, 1898.

"Petition of the Proprietors of and Dealers in Proprietary Medicines, including the Wholesale and Retail Dealers in Drugs, of the United States."

"The undersigned, representing the industries mentioned, hereby earnestly petition your Honorable House of Representatives and Senate of the United States, that the War Tax upon Proprietary Medicines may be promptly or speedily revoked, for the following potent and valid reasons:—

"1. Because it is founded upon entirely erroneous ideas as to the origin and value of these medicines, the general or prevalent idea being that these medicines are mere nostrums, the outcome of ignorance and greed, for gain; and that they are of no value as curatives for disease and are deserving of no legal recognition.

"WHEREAS, The real fact is that they, to a very large and universal extent, are the best and most successful prescriptions of our most advanced and successful physicians. The story is simple. The physician, and the more eminent he may be the more likely this result is to happen, sends his prescription to his druggist, who carefully prepares and sends it to the patient: this is followed by others and others, all made of the same ingredients and the same proportions and they are largely or even eminently successful. The druggist is alive to this—he knows from his own observation that he has in hand a cure for a certain definite form of disease, and gives it a name and launches it upon the public as a remedy for a certain form of disease."

Price Protection for Secret Nostrums:—We are now confronted by an anomaly. After doing all in their power to supplant the pharmaceutical profession with the medical profession and the public, the "proprietary" medicine trade is appealing to pharmacists to support them in securing legislation for the protection of the manufacturers against "fraudulent substitution," and the pharmacists are asking for price-standardization laws for the protection of prices of commercially-controlled and nationally-advertised products. Both of these objects are certainly in a sense desirable under existing conditions, but both should be carefully considered before the American Pharmaceutical Association commits itself to any action concerning either.

It should be remembered that the exclusive license granted to pharmacists, is largely dependent upon benefits conferred by the pharmaceutical profession upon the public. These benefits consist of, (1) the supplying of the public with medicines properly prepared from drugs selected by persons skilled in pharmacognosy, standardized to conform to the requirements of the U. S. P. and N. F., and compounded and dispensed by skilled pharmacists. Do the secret nostrums on the market conform to these professional and scientific requirements? (2) The protection of the public, from the results of ignorance and greed on the part of those who desire to exploit the sick for financial gain. Are pharmacists doing their duty to the public in this respect, when they deal in secret nostrums?

The manufacture and sale of secret nostrums, is certainly not legitimate pharmaceutical practice. Secrecy and monopoly are opposed to the principle of fraternalism and coöperation, which is claimed to be the foundation stone of professionalism in medicine and pharmacy. And yet both professions are violating this principle every day; the medical profession by prescribing secret and monopolized medicines, and the pharmaceutical profession in making and selling them.

When the above facts are taken into consideration, it is evident that neither profession has a right to demand exclusive right to practice its respective professions unless it is willing to fulfill its professional obligations to the public.

The question then is, how far can the pharmaceutical profession sanction a plan in which the secret nostrum manufacturers profit at the expense of the public? It is claimed that price-protection legislation will prove of great benefit to the manufacturers of nationally-advertised goods. Care should be taken by the pharmaceutical profession in dealing with this subject, and in aiding in securing such legislation to see that nothing is done to further degrade pharmacy.

The "proprietary" medicine trade have built up an enormous commercial business in drugs, representing millions of dollars of capital, which business has supplanted the pharmaceutical profession, and largely taken the place of the doctor in treating the sick. As for pharmacy and medical laws, which, theoretically, limit the practice of medicine and pharmacy to licensed practitioners, they do not apply to either vocation when conducted at wholesale.

The "proprietary" trade is already strong enough to defy the medical and pharmacal license laws. Surely nothing should be done to increase the grip of the nostrum trade on the public, and to decrease the influence and the business of medical and pharmacal practitioners. A law permitting the alleged proprietors of secret nostrums to fix the price of prescriptions confessedly stolen from the medical and pharmaceutical profession, and falsely advertised, as specifics or cures, has no defense. However, the false system of advertising adopted by these manufacturers, may be finally checked by the enforcement of the Shirley amendment to the national pure food and drug law and thus curb the secret nostrum business.

In regard to price protection, as you of course know, several bills are now before Congress having as their object the protection of prices for nationally advertised goods. President Wilson, in referring to such legislation expresses the opinion that "underselling to injure competition or create a monopoly is wrongful and should be punished; that low selling, when not for these reasons, should be permitted, otherwise little merchants would suffer and aim of legislation to curb trusts, defeated." If legislation were first secured forcing the medicine manufacturers to place their business on a legitimate basis in relation to the public, price protection laws as thus explained by President Wilson seem to present many advantages. Until the "proprietary" medicine business is purged from fraud and unfair competition with the medical and pharmaceutical professions, it should be exempted from protective laws of any kind whatever.

A Law to Prevent "Fraudulent Substitution":—While this discussion regarding price-protection of "proprietarys," has been going on, the "proprietarys" have

been busy in securing legislation to prevent fraudulent substitution, by passing a law in New York State more clearly defining what is meant by that term. As there is a vast deal of difference between fraudulent substitution and legitimate competition, illustrated by the act of the pharmacist who recommends a pharmacopœial or National Formulary preparation in place of a secret nostrum, this law may aid in making that difference more apparent. We refer to the "Act to amend the New York Penal Law in Relation to Trade-Marks" approved by Governor Glynn on April 14, 1914, which will take effect September 1, 1914. Clause 8 reads as follows:—

"Section 2354. Offenses against trade-marks. A person who shall knowingly sell, offer or expose for sale any article of merchandise, and shall orally or by representation, name or mark written or printed thereon or attached thereto or used in connection therewith, or by advertisement, or otherwise, in any manner whatsoever, make any false representation as to the person by whom such article of merchandise or the material thereof was made, or was in whole or in part produced, manufactured, finished, processed, treated, marketed, packed, bottled, or boxed, or falsely represent that such article of merchandise or the material or any part thereof has, or may properly have, any trade-mark attached to it or used in connection with it, or is, or may properly be, indicated or identified by any trade-mark, is guilty of a misdemeanor and punishable for the first offense by a fine not less than fifty dollars nor more than five hundred dollars, or imprisonment for not more than one year, or both such fine and imprisonment, and for each subsequent offense by imprisonment for not less than thirty days or more than one year, or by both such imprisonment and a fine of not less than five hundred dollars or more than one thousand dollars.

The fixing of prices of medicine by unlicensed practitioners for licensed practitioners to follow under penalty of the law; and the establishment of a law which appears to be so ambiguously expressed as to admit of being contorted, to punish pharmacists for offering to sell similar preparations of their own manufacture, are alike objectionable.

Your committee has the privilege of calling your attention to legislation recently enacted in the Philippine Islands which may well be adopted by the entire United States. This legislation, which went into effect July 1, 1914, requires the publication of quantitative and qualitative formulas on all labels of medicinal products; and that the advertisements of all such products shall be truthful and be accompanied with such formulas wherever they shall appear. No medical or pharmaceutical journal or daily paper containing an advertisement of a medicine will be permitted to circulate in the Philippine Islands unless the publisher complies with the law. Price protection under the protection of such a law would be largely free from the objections which now apply to patented and secret medicines sold at fanciful prices and advertised in a misleading manner to create a fictitious demand.

Redemption of Pharmacy from Unlicensed Practitioners:—Your committee also takes pleasure in reporting further progress in relation to the propaganda going on in various parts of the world, for the redemption of pharmacy from unlicensed practitioners and its restoration to a professional vocation.

At the Saratoga convention of the New York State Pharmaceutical Association held June 23rd to 25th, 1914, attention was called in the report of the Committee on New Remedies, to the fact that the "tar-barrel" has not yielded as many remedies as in former years. Nevertheless, the manufacturers of chemical and synthetical products are very active and are introducing products that will replace those on which the patent is about to expire. This can be observed in the case of aspirin or acetylsalicylic acid, the manufacturers of which are now introducing novaspirin, which is methylene-citryl-salicylic acid. The same holds true of atophan-2-phenyl-quinoline-4-carboxylic acid—which is being replaced

by novatophan, the ethyl ester of paratophan-6-methyl-2-phenyl-quinolin-4-carboxylic acid.

The Committee also calls attention to the good work that has been done in the United States as well as in foreign countries, in analyzing so-called "proprietary" medicines. Credit is given to the Chemical Laboratory of the American Medical Association and to the Ohio and also to the North Dakota Dairy and Food Commissioners, who have greatly helped in the exposure of some of the worthless nostrums. Excellent work in this connection has also been done in this country, by Prof. L. E. Sayre of the Kansas State University, and Dr. S. J. Crumbine, Secretary of the Kansas State Board of Health, and by Prof. D. H. Thoms, director of the Pharmaceutical Institute of the University of Berlin, and Dr. C. Mannich, of the Laboratory of the University of Goettingen. By the publication of the analyses of these remedies, the physician and pharmacist are being informed of their identity, thus permitting their investigation by these professions.

Turning to the Proceedings of the American Medical Association we note the Chairman's address read before the Section on Pharmacology and Therapeutics, at the Sixty-fifth Annual Session, held at Atlantic City, June 22nd-26th. The Chairman, Dr. John F. Anderson, Director of the Hygienic Laboratory, U. S. Public Health Service, Washington, D. C., called attention to "Some Unhealthy Tendencies in Therapeutics." This subject is well worthy of consideration by the American Pharmaceutical Association. Dr. Anderson says, "A large number of new *materia medica* products have been introduced within the last decade, for which claims have been made so extravagant as to warrant classing some of them as 'fake' remedies. The exaggerations displayed in advertising many other products which in themselves are of marked therapeutic value, has a tendency to throw disrepute upon them also." The tendency to prostitute pharmacy and therapeutics for dishonest commercial exploitation, is certainly a very unhealthy tendency and is throwing the entire drug business into disrepute. The monopoly established over some of these preparations by the great commercial houses engaged in the *materia medica*-supply business, by patents and by the control of their generic names and by secret formulas, and the large capital used in their commercial exploitation by misleading advertisements is tending to divert the preparation of medicines away from the pharmaceutical profession and the practice of medicine away from the physician, and into the hands of unlicensed practitioners, ignorant alike of disease and its proper treatment.

Is it Ethical for a Physician to Patent Surgical Instruments or Profit by Their Sale? If Not, Why is it Right for the Pharmacist to Do So?—We also note with interest that the A. M. A. is facing a similar problem concerning the assignment of patents to the Association, that the A. Ph. A. has under consideration. The patentee of a new surgical instrument presented his patent to the A. M. A., offering to donate his invention to the public under the protection of the Association. The offer is still under consideration.

However, there is one feature of this offer differing from those made to the A. Ph. A. The inventor promises not to engage in the making of money out of his invention. In the debate resulting from this offer, certain points regarding medical ethics, which have a strong bearing upon the recognition of pharmacy as a profession by the medical profession, were brought out, vital to the interests of pharmacists.

According to medical ethics it is unprofessional to patent surgical instruments or medicines or engage in the business of making them for sale, on the ground that a physician cannot occupy a *judicial* position toward the things he advocates as therapeutic agents or prescribes for the treatment of the sick.

Under such ruling, pharmacy can never be recognized as a profession because the pharmacist has things to sell. But how about the physician who sells his advice? How about the physician who dispenses his own medicine? How

about the medical journals that accept the advertisements of medicines? especially those commercially controlled by patents and trade-marks? Are they in a *judicial* position? How about Ehrlich and his patented and "trade-marked" Salvarsan, and the royalty he receives from the manufacturing chemical house engaged in marketing it? How about the Journal of the American Medical Association and its Council on Pharmacy and Chemistry? Does not the Journal accept advertisements of commercially-controlled products and do not the editors and members of Council—at least some of them—get pay for services rendered? Are they in a *judicial* position? Evidently they are not if accepting money for work done, necessarily places them on the side of advocates rather than judges, even though they obtain their pay indirectly from the advertisers.

It is true that we are all honestly biased by the things we believe in. But it is not true that no man can be *honest* who receives pay for his services. This fact is recognized in scientific circles, and medical and pharmaceutical societies and press exist for the very purpose of correcting the bias of selfish interests by free and open discussion. What is needed is impartial discussion of every advertised *materia medica* product by the professional societies and press, not only by physicians but also by those engaged in their manufacture. Open the door to the manufacturers of these products and let us hear what they have to say about them.

But that does not mean open the door to firms or corporations to discuss *materia medica* products in the professional societies or press. *Science requires individual responsibility*. Let the *individuals* having the personal charge of the manufacturing of the medicines used by the medical profession, tell us how they are made and what they are made of. If they are not sufficiently educated as scientific men to do that, they are not fit to have charge of such important work and we want to know about it.

Neither does it mean that we should open the professional societies and press to commercial exploitation by the manufacturing houses. The educational channels must be kept free from pretense and error and not converted into an advertising bureau. The press and societies can control the situation, either by refusing to accept information in their advertising columns or reading columns, concerning commercially controlled products except to condemn them; or by establishing a board of control, admitting to fellowship manufacturing houses willing to donate their product patents to the public and permit them to be honestly discussed. If there is no way to establish a scientific literature concerning advertised *materia medica* products, because they are being advertised, it is time to make the advertising of medicine a penal offense.

Under a revised system of patents free from the objectionable monopolistic features of our present patent-system, and under conditions that may readily be brought about by reforming the trade-mark system, there appears to be no greater objection to physicians availing themselves of patent-protection than pertains to their protecting their literary productions by copyright. Under present conditions the patent-system and the trade-mark system are conducted in direct opposition to the ethical principles underlying the proper practice of either medicine or pharmacy.

As for the patent and trade-mark laws, are we not forgetting their true object? The Constitution of the United States upon which these laws are founded, if they are constitutional, informs us in relation to the patent law, that, "to promote progress in science and useful arts," Congress shall have the power to grant authors and inventors for limited times the exclusive use of their respective writings and discoveries. If the patent law can be so applied to medicine as to promote progress in medical science, promote knowledge of the medical arts, and promote the commercial interests of physicians, pharmacists, botanists, bacteriologists and others engaged in the practice of the arts of preparing medicines and applying them to the relief of suffering and the curing of the sick, then let us as professional men coöperate in securing its application in such manner as to attain these objects. It is to the advantage of all concerned that inventors shall be encouraged

to invent and publish their inventions for the benefit of science, and the arts, and commerce. Let us not refuse them the financial rewards and scientific credit which is their due. *But we must know who they are and hold them personally responsible before we can assure ourselves that the rewards and credits go to whom they belong.*

Finally, let us not forget that such rewards and credits, according to the patent law, only belong to those who have in fact invented something *new and useful*, and do not belong to those who have invented nothing but names and are building up monopolies in the sale of medicines which do not belong to them. The patent law properly applied to medicine is compatible with professionalism and scientific progress; but the so-called "proprietary" system, with its secrecy, abuse of the patent and trade-mark laws, "hog-latin" nomenclature, misleading advertisements, and pretense to invention and discovery, is a hydra-headed monstrosity unfit to survive in this day of the square deal. The trade-mark law was never intended to protect capital invested in a business which is so apparently contrary to public welfare.

When it is considered that during the past thirty years, tens of thousands of alleged "new remedies" have been commercially introduced by advertising and recommended as superior to materia medica products already in use, and not one tenth of one per cent of them have proved of sufficient therapeutic value to justify their introduction, also that physicians have been largely deluded by misleading advertising to prescribe them, also that pharmacists have been forced to sell them; and the interests of the sick have been correspondingly injured; it is evident that all concerned should coöperate in correcting this abuse. Therefore your Committee suggests as an initial move the plan described in the following

PREAMBLES AND RESOLUTIONS IN REGARD TO NATIONALLY ADVERTISED DRUGS AND MEDICINES.

WHEREAS, The Supreme Court of the United States in the Singer Sewing Machine case (1895) decided that: "The result, then, of the American, the English, and the French doctrine universally upheld is this, that where, during the life of a monopoly created by a patent, a name, whether it be arbitrary or be that of the inventor, has become, by his consent, either express or tacit, the identifying and generic name of the thing patented, this name passes to the public with the cessation of the monopoly which the patent created," and

WHEREAS, In the same decision the Supreme Court states: "Where another avails himself of this public dedication, to make the machine and use, the generic designation, he can do so in all forms, with the fullest liberty, by affixing such name to the machines, by referring to it in advertisements and by other means, subject, however, to the condition that the name must be so used as not to deprive others of their rights or to deceive the public, and therefore that the name must be accompanied with such indications that the thing manufactured is the work of the one making it, as will unmistakably inform the public of the fact," and

WHEREAS, It has been decided by the courts and it is a recognized principle of law, that "When an article is made that was theretofore unknown, it must be christened with a name by which it can be recognized and dealt in, and the name thus given it becomes public property, and all who deal in the article have a right to designate it by the name by which it is alone recognizable,"¹ and

WHEREAS, There can be no such thing as an exclusive right to any particular line of industry,² unless that industry is controlled by a patent, so that any person who knows how to make the same thing, and has obtained his knowledge in a legitimate manner, has a right to do so, and to offer the same for sale under its identifying name, i e., the name used by the purchaser in buying the article, and

¹ Leclance Battery Co. vs. Western Electric Co., 23 Fed. Rep., 227.

² See "Report of the Commissioners Appointed to Revise the Statutes Relating to Patents, Trade and Other Marks, etc." under Act of Congress, approved June 4, 1898.

WHEREAS, Medical and pharmaceutical science, and the requirements of pharmacopœial standardization and scientific literature demand the adoption of a fixed and changeless nomenclature, the publication of accurate knowledge of each materia medica product, as to its identity, physical, chemical and therapeutic properties, methods of preparation, compounding and dispensing, and the verification of claims to therapeutic efficacy by clinical tests by competent observers, and

WHEREAS, Public welfare demands that each brand of every product shall be branded with the name of the producer or his identifying mark or trade-mark, that his identity may be known and his responsibility fixed, thus permitting physicians, pharmacists and the public, to specify and receive the brand they may prefer, therefore, be it

Resolved, That We, THE AMERICAN PHARMACEUTICAL ASSOCIATION, invite the manufacturers of nationally advertised materia medica products to send to the Secretary of the Association a list of their advertised products, the same to include generic names or titles or trade-marks to be used for specifying brands, whereby the Association representing the Pharmaceutical Profession may be aided in providing the materia medica products on the market with proper nomenclature, and be it

Resolved, That we hereby give notice to manufacturers who neglect to respond to this invitation, that by so doing they tacitly consent to the use of the names of their products as common property, by any and all persons who may know how to make the same articles and have obtained their knowledge in a legitimate manner, and be it

Resolved, That we supply the medical and pharmaceutical journals with copies of these Preambles and Resolutions requesting editors to publish them and call especial attention to their provisions; and, after the lapse of 90 days, that the Secretary of the Association mail a copy to each manufacturer advertising in the medical and pharmaceutical journals, and the principal manufacturers advertising in the newspapers, inviting them to cooperate with the Association in fixing the nomenclature of the nationally advertised materia medica.

PROFESSOR PUCKNER'S REMEDY FOR THE TRADE-MARK ABUSE.

A copy of the above report, including the Preambles and Resolutions, was sent to Prof. W. S. Puckner, Secretary of the Council on Pharmacy and Chemistry of the American Medical Association for criticism and comment. Unfortunately his reply did not reach your committee in time to avail ourselves of all of his valuable suggestions. However, the following are so important that we have herewith added them to the report. Prof. Puckner says:

"There is no doubt that the proprietary system is an unqualified abuse, but the correction of this abuse is largely dependent on aggressive action by pharmacists and has little or no interest for medical men, despite the fact that they have from time to time registered their objections.

"The resolutions offered in connection with the report are rather vague, and if adopted will, in my estimation, lead to nothing except possibly to create further confusion. To my mind resolutions something like the following would be much more to the point:

WHEREAS, The objects and uses of a trade-mark are at the present time not thoroughly understood, and

WHEREAS, A number of the words registered in the United States Patent Office are in reality words descriptive of the goods on which they are used and can in no way be construed as marks to distinguish the origin or manufacture of the goods from other goods of the same class, now, therefore, be it

Resolved, That the American Pharmaceutical Association request the Commissioner of Patents to discontinue the registration of words and phrases contrary to the spirit and letter of the existing law; and be it further

Resolved, That the American Pharmaceutical Association instruct its General Secretary to apply for the cancellation of trade-mark registration in accordance with the provision made in the rules of the Patent Office relating to registration and annulment of trade-mark.

After reaching Detroit so much interest was manifested in the subject of patents on medicinal chemicals on account of restricted supplies from war conditions existing in Europe that the following resolution was added to our report at the request of many prominent representatives of pharmaceutical and drug interests present at the meeting:

RESOLUTION REGARDING PATENT LAW AMENDMENT.

WHEREAS, The difficulty experienced in this country of obtaining supplies of materia medica products patented by the United States and manufactured abroad, and the consequent increase of prices, owing to existing war conditions, emphasizes the necessity of providing ways and means for producing these products in the United States, therefore, be it

Resolved, That we, the American Pharmaceutical Association, hereby memorialize the Congress of the United States, appealing for an amendment of the United States Patent Law which shall make it obligatory on the part of manufacturers of such products to manufacture them in this country within a specified time dating from the issue of patents, under the penalty of revocation of patent privileges.

Respectfully submitted,

FRANCIS E. STEWART, M. D.,
For the Committee.

HARRY V. ARNY, PH. G., PH. D.,
Editor Druggists' Circular.

FREDERICK J. WULLING, PH. G., LL.B.,
President, American Conference of Pharmaceutical Faculties.

Editorial

ERNEST C. MARSHALL, Acting Editor.....63 Clinton Building, Columbus, Ohio

Thanksgiving.

HOW much there is expressive in this homely, old Anglo-Saxon word. How it appeals to the heart, stimulating the better nature of all mankind.

A delightful day, with its crisp air; its hint of winter's joys; its home-gatherings, with union of those long-separated; its jollity and its feasting; a day when all America can unite in heart-felt thankfulness that the Mayflower and her little, feeble band, seeking for political and religious freedom, came at last to their destination, and made a safe haven on "the stern and rock-bound" coast of New England, even though their highest achievement had been but this day.

We of the pharmaceutical world have much to be thankful for. We have the joy of living, the pleasures of helpfulness to others, to those who are sick and ailing. Much to be thankful for! Why, the whole world is before us to make us glad. The whole world? No, to our sorrow, we regret that, not the whole world, for across the sea there is much to make us sad. But, perhaps, with all, out of this *debacle* may come a better and a higher life for the peoples of Europe. "God works in a mysterious way His wonders to perform," and it may be that from the cruel war will come great good to the whole world. Out of the storm and stress of the French Revolution came the freedom of the *paysan*, the abolishment of arrogant nobility and liberty for the people. Some one has said that that Revolution was the first attempt to make the "Golden Rule" effective in this world, and perhaps out of this cruel strife will come another step toward that glorious end; one which will destroy that devilish paraphrase of that splendid rule of Life, which, enunciated by David Harum, has done incalculable harm to the world. "Do others before they do you, and do it first," is a devil's rule of life. Out of this strife, cruel and terrible though it be, may come to the people of these warring countries, the knowledge that they and they alone, are "THE STATE," and that all men are brothers, children of One Great Father. Kings, Emperors, Kaisers and nobles may learn that, "*Dei Gratia*," there is nothing higher or nobler in this world than a true man. That he alone is the NOBLEMAN, who is ennobled by his deeds and by his character, not by his birth.

Let us then, in this free America, where in the "melting-pot" of nations, we free men from the dross which clogs and stifles life in the older civilizations, give Thanksgiving that we are free, and that, although Government of the people is not without fault, it is infinitely better than government of lineage, government of militarism, of those "born to the purple."

On this day, give thanks not alone for what good we have, but also for what we have not of the evils of life, and let us bend our energies to making Pharmacy better, higher and nobler, and America, in truth, what our forefathers laid foundation for.—a land of freedom and of opportunity for the oppressed of all nations.

We stand upon the threshold of the door of Opportunity. Not the door of Commercialism, of sordid and debasing trade. But the opportunity of showing to the world the way to a better and a higher Civilization. Let us on this day dedicate ourselves to be better men and wiser men, and let our most fervent prayer upon this Day of Thanksgiving be, that we may do high and noble service to Pharmacy and, in so doing, to this land where, no

"Rank is but the guinea's stamp,
The man's the gowd for a' that."

THE WAR AND THE DRUG MARKET.

THE initial flurry incident to the declarations of war in Europe, has now somewhat subsided, and it is beginning to be possible to approximate the actual value of drug and chemical commodities of various sorts.

Under the early excitement many, who were dependent upon foreign supplies for their continuance in business, became "wild" and their efforts in the market to obtain future supplies, was doubtless a chief factor in forcing abnormal prices. This rush to obtain supplies for an unlimited period, became absolutely ridiculous, going to the extent even of affecting values on indigenous products in the drug line. As for example, the placing of an order for 500 barrels of powdered elm bark, *Ulmus Fulva* (which in its *habitat* is far removed from the scene of war), was uncalled-for and unwise and is an illustration of the lack of information on the part of those charged with the purchasing of supplies for large users of drugs. There is no more reason for an advance in the price of powdered elm bark than there is for change in the orbit of the moon, and yet it has come to us.

A very large part of the advance in prices of drugs and chemicals is due to what may be styled "frenzied buying" on the part of large consumers who do not seem to be well informed of sources of supply.

It is certainly true that all foreign products are due for an advance in price, and in some instances this is basic,—that is the original source of supply is curtailed or absolutely cut off,—but the greatest influence with respect to foreign products has to do with shipping facilities.

Immediately following the declaration of war, the merchant marine practically suspended business, so far as individual movements were concerned, and the earliest factor entering into the question of prices, is that of transportation, rather than a question of supplies at the place of origin.

We have now to note the reaction following the early frenzy.

It is not new to state, that commerce is the controlling influence in the world. It is to be noted, in the present situation, the movement of merchandise is of more importance to the world's welfare than the movement of armies, which latter can affect only a comparatively limited territory, while the first is world-wide in its influence.

It has been truly said that the present contest at arms, has not been paralleled in the history of the world, and yet the lines of commercial influence are already being drawn and are bound to influence the mighty contest now on.

The earnest endeavor of some of the nations engaged in the present conflict, seems to be and really is to ensure safety at sea for merchandise. This is very clearly shown by the desire of shippers, who have merchandise to transport across the sea, to secure their shipments under the flag of a nation which shall have at least a claim to exemption from war conditions.

The drug markets at the present time, are showing a reaction from the frenzied influences above mentioned toward a meeting of the conditions which actually exist. We note, in the general drug list, a very general decline from the excessive prices prevailing immediately after the outbreak of the war, the natural reaction following the conditions. Market values on foreign drugs and chemicals are

still much higher than the normal, and legitimately so, because of the increased cost, not of production, but of transportation.

From general reports which come to us, we are assured that the ordinary supply of foreign drugs for the current "crop," is held at the source of supply, and, in many cases, an extraordinary crop is in store.

The difficulty in transportation; the increase in transportation rates, the increase in marine insurance and the uncertainty surrounding deliveries, are now the only remaining excuses for general advances in values. Perhaps the most common is the marine insurance item.

It has come to our knowledge that marine insurance, in some cases at least, has been placed on a 20% *ad valorem* basis and the least advance of which we have knowledge is 25% advance on former prevailing rates.

It has been claimed with respect to the drug products of the warring nations, that the present year's "crop" has been sacrificed to the marching armies. Later reports deny this and the statement is made that this year's "crop" is considerably above the normal, and all that is needed to bring market values down to or even below the prices prevailing before the war, is a reasonably safe means of transportation.

The extension of the war to the colonies of the nations involved, will naturally extend the conditions heretofore stated, to certain products in these colonies, as for example, the drugs which we procure from Central and South Africa, and, possibly, as the Asian condition is developed, to East Indian and Japanese products. But as in respect to these, it seems that for the most part, sufficient stocks are already in this country to tide over a period of many months.

In regard to chemicals, it is well known that Germany has been the center of the chemical industry for many years, and that it has held the master-hand over many of what are classed as the necessary chemical products, particularly the organic or synthetic products. The German government has been very largely paternal with respect to its chemical industries, and they have been fostered in a variety of ways, until they have practically a world-control. The stoppage of these industries in Germany, has worked a hardship to the entire world, in that it must either pay exorbitant prices for certain products or do without.

We Americans, confronted with such a condition, naturally rebel, and exclaim: "Why can't we do these things ourselves?" The question is easily answered by the statement that we certainly can, but we should follow it by the subsequent statement that "We won't" and "Cause why?" Simply because, commercially, we cannot put ourselves on the German basis. We have heard much about establishing chemical industries in America to meet the present situation, which is all well and good. We certainly can do it. We have the money, we have the trained chemists, and ability to carry on the business in full, but it won't happen until conditions change very materially. Suppose we start a chemical plant for the production of organic bodies, as for instance benzoic and pyrogalllic acids, hydroquinone, and all the limitless number of synthetics produced from "coal tar." It would involve the investment of a large sum of money running into the millions, to organize and equip a proper plant. Now, having done this thing, and demon-

strated that we can produce all these products, when the war is ended, what will happen?

The millions that have been expended in the building of the plant and organization, will count for naught against the renewed German competition. We all know that the lowest class of American workmen receive a wage two, three, four times beyond that of the foreign workman, whether he be German or of any other nationality, and it is foolish to ignore the fact that, in certain chemical industries, we cannot compete, until our government protects our chemical industries as does Germany and some other countries.

It is true that Germany has some natural advantages, as for instance, she has some deposits of mineral containing potash, which we do not possess or which, if we do possess, have not yet been exploited, but the real reason for her commanding position in the chemical industry is the government support which these industries receive.

We see in the public press, the chemical, pharmaceutical and other journals, arguments and statements with regard to our ability to take care of ourselves in the matter of chemical products, but we will not do it until our government protects this industry, as is done in foreign countries, and with consideration for the diverse standards of living between American and foreign workmen.

GEORGE B. KAUFFMAN.

THE NEW PHARMACEUTICAL SYLLABUS.

THE attention of the members is especially called to the criticisms of the Syllabus, which appear on P. 1495.

As this work is one intended to powerfully and definitely influence the course of Pharmaceutical education in this country and to provide uniform, definite and certain courses of education for its coming pharmacists, our readers are earnestly requested to transmit to the Journal any succinct and informing comment upon the Syllabus which they may think desirable to make, with the purpose of determining its true value in pharmaceutical education.

ELECTION OF OFFICERS.

Just as we go to press, the following announcement is made by the Board of Canvassers of the result of the election for officers of the Association,

President, Dr. William C. Alpers, of Cleveland, Ohio.

First Vice President, Charles H. LaWall, Ph. M., of Philadelphia, Pa.

Second Vice President, E. A. Ruddiman, M. D., of Nashville, Tenn.

Third Vice President, Linwood A. Brown, Phar. D., of Lexington, Ky.

Members of the Council, Caswell A. Mayo, Ph. G., of New York, F. M. Apple, P. D., of Philadelphia, Pa., Harry V. Arny, Ph. D., of New York, N. Y.

The Board of Canvassers comprised the following members:—Clyde M. Snow, Chairman, Irwin A. Becker, William Gray, Henry W. Colson, Mrs. M. M. Gray, all of Chicago, Ill.

The Journal extends to the newly-elected officers its sincere congratulations, and also those of every member of the Association.

JOSEPH PRICE REMINGTON,

CHAIRMAN OF THE COMMITTEE ON REVISION OF UNITED STATES PHARMACOPOEIA.

Born March 26, 1847, in Philadelphia, Professor Remington comes, on the distaff-side, from Townsend Speakman, one of the earliest Philadelphia apothecaries. For three generations his ancestors have been residents of that city and members of the Society of Friends.

He began his pharmaceutical life in the employ of Charles Ellis, Son & Co. of Philadelphia, on January 1, 1863. While in the employ of this firm he commenced the study of pharmaceutical science at the Philadelphia College of Pharmacy, graduating therefrom in 1866.

The first day of January, 1867, he entered the employ, and became a member of the family of Dr. E. R. Squibb, which connection he maintained for three years. Returning to Philadelphia he engaged with the firm of Powers & Weightman, with whom he remained for four years, leaving them to start in business for himself, at the corner of Thirteenth and Walnut Sts., at which place he remained for thirteen years.

In 1871, he became the assistant to Edward Parrish, Professor of Pharmacy at the Philadelphia College of Pharmacy, and on his death remained as assistant to his successor, Professor William Procter, Jr. On the death of the latter, in 1874, he was elected to succeed him as Professor of Pharmacy. In 1879 he was chosen as Director of the Pharmaceutical Laboratory and in 1893 he was made Dean of the College.

He became a member of the American Pharmaceutical Association in 1868 and has served the Association well and faithfully in many important positions. From the formation of the Council in 1880 he was its Chairman until the year 1886. In 1893-4 he was the Permanent Secretary, and in his important service upon many committees he has given to the Association most valuable and loyal service, which was recognized in 1892 by his elevation to the Presidency of the Association, at the meeting in the "White Hills" at the Profile House, New Hampshire. In 1893 he presided at the meeting of the Association at Chicago, on which occasion he also presided over the Seventh International Pharmaceutical Congress. In 1878 he was one of the organizers of the Pennsylvania Pharmaceutical Association, and in 1896 he was elected as its President.

Besides his numerous and valuable contributions of papers to pharmaceutical literature, he is the author of Remington's Practice of Pharmacy, and he has been an Associate Editor of the United States Dispensatory, since 1879. In 1897 he became the Pharmaceutical Editor of Lippincott's Medical Dictionary. He represented the United States at the Eighth International Pharmaceutical Congress at Brussels, Belgium, in 1896, was a delegate to the Pan-American Medical Congress in 1893, and again in 1896.

His connection with the Pharmacopœia began in 1877, with service upon the Auxiliary Committee of Revision appointed by the Philadelphia College of Pharmacy. The following year the College appointed him as a delegate to the National Convention on Revision of the Pharmacopœia and he was chosen as a member of the Revision Committee and First Vice Chairman of that body. In 1890 he was again a delegate to the National Convention, and, on the death of Mr. Charles Rice, the Chairman of the Convention, he was elected to the position of presiding officer. In May, 1910, he was unanimously elected Chairman of the Committee on Revision.

In 1874, Professor Remington and Elizabeth B. Collins were united in matrimony and three sons and two daughters are the fruit of that union.

Professor Remington maintains a delightful summer-home at Longport, N. J., where much of the work of the revision of the Pharmacopœia is done.

Section on Practical Pharmacy and Dispensing

Papers Presented at the Sixty-Second Annual Convention

ALL FOOL'S DAY AT THE DISPENSING COUNTER.

HENRY P. HYNSON, PHAR. D., BALTIMORE.

Looking backward, through the mist of four decades, at the dispensing counters of city drug stores, if one has had good digestion and has done his "duty in that state of life unto which it has pleased God to call him," he must have very happy realizations of great progress and helpful development. If he can see even small evidences of his own contributions to this progress and to this development, there is added satisfaction and added happiness. Knowing, so perfectly, all that you do not know that you might know, about dispensing and actually *feeling* the truth of Osler's sound philosophy, you still may enjoy the retrospect, and contemplate, with comfort and pleasure, the greater ease, the greater comfort and the still greater usefulness of the better-equipped counter and the better-equipped dispenser of this better day.

One hundred and two physicians' prescriptions, and about twenty, out of the hundreds of general orders, which required dispensing knowledge,—some of them of the highest kind—was not a great day, as days go in "big stores," but they offered excellent opportunity for the exercise of many of the possessed attainments and, very likely, for many more that were unpossessed.

Of course, there were very many uninteresting and very usual prescriptions and orders; the more so because they are so usual that every one has learned to do them, just as every one has learned to do usual things, no matter how difficult they may be or how stupid is "every one."

This "All Fool's Day" was not a remarkable day at the prescription counter; nor was it selected *after* its offerings were known, yet it presented almost every variety of dispensing. Strangely enough, there was not much, about which the "damned doctor"—might be criticised. One of them did prescribe a super-saturated solution of calcium lactate, which would have resulted in a solidified mass, had it been sent out as a solution. But it had been learned that when more than five per cent of this salt, compared with the water present, is prescribed in solution, no attempt should be made to dissolve the lactate. Under such circumstances, the fine, bolted powder should be simply *mixed* with the fluid, whatever it may be. The frequent mis-ordering of calcium lactate is not always the fault of the prescriber, since authorities differ as to its solubility,—the variations, no doubt, arising from the differences in the ages of the products with which the several experiments were made; the salt is most soluble when freshly prepared.

The uncertain solubility of calcium lactate; forgetting that strontium is an alkaline earth and forms insoluble carbonates and sulphates, and not knowing that sodium nitrite is very easily decomposed, especially in acid liquids, are the three items that seem to give modern prescribers more trouble than all else beside.

Naturally, there were a good many proprietaries prescribed. The best the pharmacist can get out of these is some profit—very good in comparison with the responsibility involved, the time required to dispense them and the splendid advertising that follows having them in stock, when called for by patrons or inquired about by physicians. There were also a number of copyrighted articles which, of course, are subject to the same requirements regarding dispensing knowledge as free chemicals. For instance, a dispenser should know and remember as much about aspirin as about salicylic acid. The chemical or scientific names of these copyrighted articles were used in a few prescriptions. There were but two instances of "specifications." This is most encouraging; it shows greater confidence in manufacturing and dispensing pharmacists. The specifications of forty years ago were a much greater burden on the dispensing pharmacist than are the proprietary and copyrighted articles of to-day. It is one brand of aspirin now; it was, at least, four makes of fluid extract of ergot and six makes of quinine-pills, then.—Cheer up, youngsters, cheer up!

There were but six prescriptions for ready-made pills, and all these were of strychnine. They were dispensed in screw-cap vials, the best and safest containers for strychnine-pills and the best for all gelatin-coated pills, excepting those containing odorous substances, like asafetida or the valerates, which should be dispensed in perforated boxes. The popular and most convenient gelatin capsule has certainly come to the modern dispenser's rescue. They have almost entirely replaced the ready-made coated pill in our city and are largely taking the place of tablets with *prescribing* physicians. A three-fold blessing, indeed, are capsules; they bless the physician, they bless the pharmacist and, most of all, they bless the helpless, long suffering victims of both,—the poor invalids. The dispenser of to-day must be careful that he does not, to the disadvantage of all concerned, use soluble-elastic or soft capsules, instead of the regular slip-on-kind, for liquids. The hard capsules appear to be safer and are much easier to dispense.

All the prescriptions for capsules were marked as having been filled "dry." Not bad practice, since moisture, as we know, especially when high temperatures prevail, has most to do with the deterioration of medicinal substances. With present high standards for powdered drugs, and the very efficient extracts dried *in vacuo*, there are very few instances when capsules may not be dispensed with the material in dry powder. The great advantages of this are many and obvious. An expert dispenser can generally use as small a capsule for the powder, as he could if it were massed. Odorous substances, like asafetida, the valerates, or iodoform and very difficult ones, like methylene blue, should, undoubtedly, be massed and introduced with a needle.

If "new clerks" and students with drug store experience, are "straws that show the way the wind blows," there is a great deal of bad pharmacy practiced in the mere dispensing of capsules. It must not be forgotten that gelatin capsules, as now made, are wonderfully transparent and plainly show imperfections in the

mixing of the ingredients and the irregular colors of the mass. These capsules must be full and full alike; if the powder or the mass does not fill the capsules, then make either large enough with inert material to fill them. But the capsules must never be too full, (it is always bad to be "too full"), they must not be so full that the caps may not be pushed *all-the-way* on, for this is the only test by which the capsules may be made uniform. The capsules should be as bright, as glossy, and as clean, after they are filled, as they were when sent out by the manufacturer. This requires some effort, some care, but it may be accomplished, and should be accomplished, even with sodium salicylate.

In a general treatment of the day's requirements, reference might be made to the folding of powder papers; to the keeping of the powder within the paper,—a difficult accomplishment with bulky, light substances. This may be done by making an *extra* complete, but *very narrow*, fold at the beginning of the folding. This will be found to be wonderfully helpful. In the distribution of small quantities of extracts through bulky powders, there comes up a question as to whether or not it is desirable to improve the final appearance of the mixture of powders by using the pilular extract, softened with alcohol or dilute alcohol, as the case may require. This treatment with extract of belladonna, brings about almost startling comparative results. Konseals, too, may be made to advertise a store, either advantageously or disadvantageously. So many dispensers use much larger cachets than necessary; easily seen by holding the konseal, edge up, tapping it and looking through it toward light. Failing to seal them effectively, as witnesseth the box containing them and the disgust of the patient, is equally hurtful to the dispenser's reputation.

The mixing of fluids of varying alcoholic strength, was an oft requirement of the day. By simply following an order of mixing that made the dilution of the stronger alcoholics as *gradual* as possible, many troubles were avoided. "The order of mixing" is really the "IT" in dispensing-pharmacy, as stock-keeping is the "IT" in commercial-pharmacy.

Solutions, making up a large proportion of our "April Fool Day" work, are always the most interesting class of prescriptions. They require the bringing to bear of all our knowledge of chemistry and of physics and, more lately, of bacteriology. Asepsis and sterilization must, now, be considered, and a fair comprehension of mass-reactions and the dissociations of elements, must be enjoyed to make the intelligent and successful dispensing of solutions possible. The dispensing of perfectly clear, reasonably sterile solutions for eye instillations, and the dispensing of ointments for the applications to eye-lids, were the most exacting features of the day's work. Yet, it was this work that had stimulated the greater confidence enjoyed. Incidentally, it may be asked, "Would it not be wise to have the Pharmacopœia standardize the strength of yellow mercurial ointment for eyes?" The present official ointment would not be what is generally wanted by oculists; about two to four per cent is usually desired by them, one or two grains to the dram.

Weighing and measuring, with the mathematics involved, are still problems that test the wits of the apothecary. He must have sufficiently accurate appliances. How, without these, could he get one eighty-fifth of a milligram of tuberculin, in

a cubic centimeter of normal salt solution containing one-half of one percent of phenol? This was one of the problems of our day and such, are of frequent occurrence in modern pharmacy. One third of a grain of strychnine sulphate to be dissolved in four fluid-ounces of compound tincture of cardamon; one-fourth of a grain of glyceryl nitrite and one-half a grain of strychnine sulphate in a three fluid-ounce mixture of tincture of strophanthus and wine; one fluid-ounce of glycerin containing five per cent of phenol, were not all of the more or less difficult problems that came to this store on this day.

Weighing and measuring and, consequent calculations, bring up the question of stock-solutions, dispensing tablets and percentage-solutions. One must be careful that he is not too conservative, too straight-laced or too hard to convince in these regards, but the actual dispenser *must know*, for he is finally responsible. If percentage by weight is wanted, and that seems to be the only way that "parts" may be compared in making definite volumes of percentage-solutions, much thought, figuring and, sometimes, valuable material, may be saved by using a method which may be illustrated by our order for "one fluid ounce of carbolyzed glycerin, five per cent." It is not necessary to know or to think about the specific gravity of glycerin; simply balance a bottle, fill it to the desired point and weigh the glycerin. Divide the weight of the glycerin by nineteen and the quotient will be the *exact* amount of phenol required; the plan can be used for oil-solutions or any fluid, distilled water included, if desired. The proposition may be stated in this manner:—If five per cent is to be one twentieth, then the vehicle—the glycerin in this instance—must be nineteen twentieths. If a ten per cent solution is required, divide the weight of the vehicle by nine; if a twenty per cent is wanted, divide by four.

The confusion of the Metric system with the Apothecaries' weight and the wine measure, continues, as witnesseth a prescription for dilute hydrocyanic acid 3.0, codeine sulphate 0.32, syrup of wild cherry and water sufficient to make 100.0, with a teaspoonful as the dose. The usual two per cent of metric prescriptions prevailed.

Ointments, as usual, required all the art of the apothecary and much of his science, as well. The introduction of pyrogallol into one of these, with its tendency to darken, causes much speculation as to what would be the color of the last portion used, and leads to the thought, that much real, helpful knowledge would follow the practice of putting up additional quantities of unusual prescriptions for observation. No doubt, many of our thought-to-be successes in dispensing, would disappoint us if we could see them after a few days. It is really remarkable how frequently salicylic acid is used in ointments, and nothing requires more care in its manipulation, considering the difficulty of entirely destroying the sharp crystals and its extreme sensitiveness to iron. Resorcinol is much used in ointments and its satisfactory introduction is only possible through the water-carrying properties of wool fat, a not yet fully appreciated pharmaceutical help. This should, certainly, be a constituent of all ointments containing appreciable quantities of resorcinol, iodine and rose water. It is strange that pharmacists should use the hydrous varieties when the anhydrous is much better for these "holding in" purposes. The failure to mix the required amount of oil

with lanoline, before it is dispensed, and the inherent differences and different tendencies of the yellow and white solid petroleum vehicles, are thoughts suggested by the ointments of one "All Fool's Day."

Not the least interesting in dispensing problems of the day, were those connected with a laboratory-order from a physician,—such orders as every ambitious pharmacist should be prepared to fill and to enjoy the profit and the good advertising that follows the successful filling. Besides many simple chemicals, it called for two volumetric solutions, two microscopic stains and three special re-agents, used in stomach analysis. The difficulty in securing correct formulas for these stains and re-agents is generally the most difficult part of their preparation and makes it appear that, if they are not of a kind desirable for the National Formulary, they might find place in the proposed Recipe Book, although, they are, in no way, out of date or un-ethical.

If what has been written for a review of one day's dispensing at one store, is interesting, then more than as much more could be written upon the identical review. It is not for want of material, by any means, but a want of faith in the greater forbearance of those before me and who have suffered, that brings the *finis*.

DISCUSSION.

Mr. Raubenheimer said Prof. Hynson had again demonstrated to the members that the every day practice in the drug store, brought things which are of interest to one and all. The most common incompatibility which they had to contend with was sweet spirits of nitre. It was an unstable preparation because no matter what one mixed it with, it will decompose. Another item was potassium iodide, particularly if there is any acid to decompose it.

He agreed with Prof. Hynson that the cleanliness of capsules is somewhat neglected in the average store. The physician prescribed capsules, in order that the patient might not taste the drug, be it quinine, valerate of zinc, ammonia or iron, and the druggist should use all precaution to have the capsules properly dispensed. According to his recollection, Prof. Lascoff had advocated the use of rubber gloves, but he thought that not to be a good practice. Mr. Raubenheimer believed that mercuric oxide ointment would be used 100 years from now because of its medicinal value. Dr. Hynson's statement was that the ointment was too strong. Mr. Raubenheimer said nobody ever thought of using a ten per cent mercuric ointment in the eyes, but that it did serve as a base to be diluted with petroleum or whatever the physician desired.

Speaking of anhydrous lanoline he reminded the members present that lanoline was originally a trade-mark name for hydrous lanoline, but was not any more. Lanoline meant hydrous wool fat and he made it himself. He never bought any hydrous wool fat. He asked why he should import water from Germany? (Laughter.)

Mr. Hynson said, in regard to oxide of mercury ointment, that it was a more serious matter than Mr. Raubenheimer would have them believe. It was his opinion that a man might have some experience, but that his judgment might not be quite matured, and he would get a prescription for ointment of oxide of mercury, to apply to the eye lids; that one might not remember that the exact strength of the official ointment. Such things did happen.

He said Mr. Raubenheimer did him an injustice as he did not say a word about lanoline; he had specifically mentioned wool fat. Whenever he got a prescription for lanoline he used the copyrighted article because he thought that was what the doctor wanted.

THE AMERICAN INSTITUTE OF PRESCRIPTIONISTS.

H. V. ARNY, PH.D.

Reform in American Pharmacy is the call of to-day. We hear of prospective legislation which will separate the real pharmacy from the bazaar drug store, even as in Germany we find the Apotheke separated from the "Drogen Handlung." A year or so ago much was said of the creation of certified pharmacists by joint committees of physicians and pharmacists, and the latest is the appointment by the New York State Pharmaceutical Association of a Committee of Eleven, to study the entire question from one end to the other.

The interesting subject has been given much thought by the writer ever since the idea of the certified pharmacist was first broached. This idea, while considered sympathetically, never seemed very feasible to one who knew how exceedingly difficult it is to get physicians and druggists in conference assembled, to agree on questions of policy. What physicians consider essential, scarcely fits the views of a majority of druggists, and what the druggists decide on, rarely agrees with medical views of the same subject.

The next thought was that the certified pharmacist should be decided by the medical men alone. The main idea of a certified pharmacist is a man fitted to cater to physicians' wants by accurately filling prescriptions and otherwise contributing to the progress of the healing art. The question therefore rose as to the possibility of establishing the idea of the certified pharmacist under the guise of "accredited agents" of the American Medical Association. This idea, however, was soon abandoned and no one realized more clearly than the writer that any plan of a medical protectorate over pharmacy will not meet with the approval of the majority of pharmacists, even those who specialize on prescriptions.

This led to a third plan, in which the certification of pharmacists is to be done by pharmacists only and this idea is here presented under the fanciful name of The American Institute of Prescriptionists.

Let us imagine the practicing prescriptionists of this association—not the manufacturers, not the professors, nor the frankly commercial retail druggist—forming an organization under the motto, "prescription compounding our foremost consideration," and let them formulate such requirements of membership as follows:

1. The candidate must be a graduate of a recognized college of pharmacy and must be a registered pharmacist in the state wherein he resides. This will be agreed to with little opposition.
2. He must be the majority owner of a pharmacy and an actual compounder in same.

This is apt to cause a split at the beginning, since much available timber may be found among those who are employes in stores owned by others, but this proviso seems essential to head off the inclusion in the plan of corporation drug stores.

3. He must show that ——— percent of the business of his store is in prescriptions.

It will be noticed that the actual percentage is left blank and that the amount of prescription business is expressed as a ratio to the total business rather than as

a minimum fixed quantity. A man running a business of only ten prescriptions a day should be eligible, if his prescription receipts represent say, 30 to 50 percent of his total business; whereas a corporation store putting up fifty prescriptions a day should be ineligible if it were shown that the prescription receipts represent only 10 percent of the total sales.

4. He should show his interest in his prescription department by having it properly equipped with the necessary appliances and properly located in his store.

Any druggist sticking his prescription department on a hot and stuffy platform, midway between floor and ceiling, in order to use the space properly belonging to it for some rankly commercial purpose, shows by that act that he considers his prescription business of minor importance and by that act renders himself ineligible to membership in the Institute. Again, any druggist who is content to run his prescription department with broken graduates, and cracked mortars and with a scarcity of even these, shows he does not care for prescription business. As to suitable appliances, these are to be the subject of a paper at this meeting, so the only suggestion I offer is that the list should be based on the needs of a ten-prescription-a-day business and that of course a proportionally larger list must be formed in those stores where more than ten prescriptions are put up each day.

5. He must have the knowledge and the ability necessary to perform the tests of the pharmacopœia and routine analysis in clinical chemistry and must have in his store the necessary appliances to carry out such work.

A painter's supply store, some years since, used in its advertising literature the legend "a paint seller should know his paints as a druggist knows his drugs," which strikingly indicates the estimate set by the public upon the druggist's ability. The colleges of pharmacy have spent years teaching students how to detect adulterations in chemicals, how to assay drugs and how to determine the quality of powdered drugs by means of the microscope.

It is not, therefore, asking too much to expect the "member of the institute" to be sufficiently interested in the products sold under his name to be willing to examine these by means of official tests.

As to work in clinical chemistry—such as urinary analysis—this is the logical side-line for the prescription pharmacist, and it might be added that unless the pharmacist is ready to assist the physician in this direction, he can scarcely expect to interest the modern practitioner.

6. Membership is limited to a three-year term, and is renewable only when the member's qualifications remain unchanged.

In all callings is found the condition that certain representatives vested with the prerogatives of the occupation in question, find more profitable work and embarrass their original calling by using its prerogatives in their new field of endeavor. A man may honor himself and his country in the national legislative halls. Or he may be a great corporation lawyer and as such win great wealth and distinction. But when a man who has won a reputation in Congress spends his vacation looking after the interests of a corporation, such a combination of functions is—to say the least—in rather bad taste. So it is entirely possible to

imagine that a man selected as "member of the institute" may attract the attention of large commercial establishments who might consider the presence of this person on their staff as a distinct asset. This might be so, and even so it might be a distinct advantage for the person in question to accept the new position, but in this event his privileges as "member of the institute" should automatically terminate and that for the simple reason that membership in the organization is limited to practicing prescription pharmacists who own their own establishments and to such independent prescriptionists only.

Now that the six requirements for membership have been stated, an entirely proper question to ask is who shall enforce these requirements and how? This leads us to the question of organizing the Institute.

We are all aware of the propriety of the private club, which essentially consists of a self-organized group of men or of women of similar tastes and of similar ideals. A small number of these gather together and organize and then invite other desirables to join with them. This is exactly the method that should be used in organizing the American Institute of Prescriptionists.

Let some twenty to fifty prescription druggists, whom we recognize as leaders in retail pharmacy as a profession and those preferably consisting of representatives from every section of this country of ours, get together and organize, and let them, and them only, invite others possessing the qualifications stated above to join them, and thus start the Institute. It should of course be operated under a national charter and if possible the title, "Member of the Institute of Prescriptionists" (M. I. P.), should be legally protected from imitation. While the membership should be unlimited as to numbers, most rigid adherence to the conditions of membership should be observed. On first thought, it would seem that no one would want so trying a position as that of member of the committee on admissions, but the work of the American Conference of Pharmaceutical Faculties clearly shows that severe conditions, strictly adhered to, have the effect of keeping out undesirables and that with little bad feeling.

As to the short period of membership, it is plain that a one-year term is not possible without reorganization each year, hence it will be well to place duration of membership at three years, thus leaving two-thirds of the members at all times in active service.

And after all is said and done, what will be the use of the Institute to its members?

If properly conducted it will be the honor roll of retail pharmacy in America, and a druggist will be as proud to belong to it as a French scientist is to be invited to be long to the Académie Française.

To be a member of the Institute, to have the privilege of attaching to one's name the initials "M. I. P." will carry the prestige which unfortunately neither the registered pharmacist certificate nor any pharmacy college degree can possess.

The registered pharmacist certificate merely gives the right to run a drug business anyway—within the law—that its holder chooses. The college degree is of little value unless the college behind the degree is doing good work, and while a certain degree from a certain college may be a real distinction, the same degree from another college may be a joke. That both the registered pharmacist certificate and the college diploma are considered important, is shown by the fact that

provision is made that the "member of the Institute" shall be the possessor of both documents, but greater than these should be the title "M. I. P.," since it will show all, notably the prescription-writing physician, that here is a man to whom prescriptions are of the first importance, a man who by the vote of his fellows, is shown to be a real pharmacist.

Once launched, the Institute itself will be in a position to devise plans of co-operation that will be of financial advantage to each of its members, but that is a detail that cannot be discussed in this paper.

In conclusion, some one may say that the American Institute of Prescriptionists (A. I. P.) is an attempt to ape after the American Institute of Surgery, which in turn according to some of its critics, is an imitation of the Royal College of Surgeons. Of course, the primal thought of organization in the mind of the writer resembles to some extent the basic principles of the institute of surgery, but in detail the Institute of Prescriptionists no more resembles the surgeons' organization that it does the American Conference of Pharmaceutical Faculties or the association of certified public accountants, both of which are self-constituted private organizations frankly designed to sift the excellent from the inferior. And, if the American Institute of Prescriptionists can accomplish that purpose in retail pharmacy, it will more than justify its existence.

DISCUSSION.

MR. F. M. APPLE:—Mr. Chairman and Gentlemen:—I personally thank Dr. Arny for bringing this paper here, and I think that all of you ought to do likewise. He states in the latter part of his address, the Society of Certified Accountants in this way sifts the good from the bad and protects its Association by that means; and if such an effort should be applied to pharmacy it would be praiseworthy indeed.

We will first of all take up the question of desirability. There is no question but that it would be desirable to have an association of this kind under certain conditions, and those conditions would depend very largely upon the method by which it is organized and the restrictions placed upon the question of membership therein.

Now comes the question of the advisability of it. It would seem as though there could be no objections to this whatsoever; but on thinking over the question you will encounter this difficulty; men who would desire to be enrolled,—and I may be one of them; I don't say I would be one of the eligibles, because I don't know what the requirements are, but those who are rejected would allude to the eligible graduates as a lot of Pharisaical Pharmacists who confer upon themselves degrees, claiming they are better than anybody else, but who cannot substantiate their claims.

The durability of such an association will depend largely upon its effectiveness, that is, how practical it is in its application. That will naturally determine whether it shall be permanent or only a temporary effort. Again, there is a duty incumbent upon us that it shall not be organized in a "hit or miss" or thoughtless manner so that it may interfere with any effort that may be made later in a better way, so if it is not organized with great care it should not be organized, in deference to those who will come after us and who may possibly have better thought on the subject than we have.

As for the requirements, which seems to be "the milk in the cocoanut," as the saying is,—the essential part,—we will agree that any man who wants to be a member of such an Institute should naturally be a graduate of a reputable college of pharmacy, and also be a registered pharmacist in the state in which he practices. As for the second requirement, that he must be the majority owner of the store, that is a very difficult problem to settle. Take, for instance, our beloved Dr. Hynson, who is the father of this Section. I do not know what percentage of the Hynson-Westcott Company he owns, hence I do not know whether he would be eligible for membership in an Institute with such a provision. I have no defi-

nite recommendation to make there, for it is a very knotty problem, but I simply call your attention to that condition as an illustration of what you would encounter if you adopt that principle.

As to the percentage of the prescription business being a vital and essential requirement, I do not think that quantity should determine such a question. Quality should have precedence over everything else. If a man had all the other qualifications and he was unfortunate in being located so that he had to meet certain forms of competition that arose in his career; that he had to include in his business other lines of merchandise which departments he has conducted in harmony with his prescription business, should he be debarred? It depends altogether, to my mind, on the manner in which he conducts his store and how much of his time is devoted to a direct supervision of the prescription department, and not, as I said before, on the percentage of his prescription business as compared to his total volume of business.

As to the appliances, I certainly believe that any man should have appliances to carry out any process of manufacture or dispensing. It is not as vital, to my mind, that a man may have a few graduates with the lips knocked off as that he have mentality represented in first-class clerks, because a first-class clerk with a cracked graduate I would trust every time far more than I would a half-prepared one with a magnificent array or accurately determined prescription graduates. A person ought to have appliances enough to carry out the process properly, but I would add thereto as an essential requirement, reliable assistants. By that means you can control this question automatically. The semi-prepared men to whom I allude are those dangerous fellows, the qualified assistants, who, according to law, are permitted, "temporarily," to run the store; and the word "temporary" has been figured out to mean anything from a half hour to a couple of weeks. If a man wishes to go away on a vacation trip with the expressed intention of coming back he is only away "temporarily." It is based upon the principle that it takes time for a man to make a mistake and jeopardize the health of a community. It does not take but a few seconds of time to bring about a calamity at any time, as we well know.

As for the man being competent to test his drugs, that, I think, is answered automatically by the first requirement; if he is a graduate of a reputable college of pharmacy he should naturally have those attainments, because I think it would be a serious reflection on a college of pharmacy if its graduates could not carry out these processes.

As for the time-limit of membership, I think that three years is too long a period of time for membership, for this reason: that a man may be a good man to-day and for some unexplainable reason he may go wrong to-morrow and the Institute would have to suffer the detriment that would accrue to it from his continued membership, and you could not get rid of the man under the three years period. You do not want to make any limit of that kind. That wants to be so arranged that a man automatically drops himself from the Institute.

And that brings up the question of whether it shall be a membership or a license. I would recommend rather a license than a membership, on the basis, also, of a financial deposit on the part of the man, in order to guarantee his sincerity. I am led to recommend this by something I recently noticed in our local papers in Philadelphia. A golf club was being organized somewhat along this line; that when a man wished to leave the club or was expelled from the club, his money was returned to him. That is why the man could not bring legal action against them. They could get rid of him by saying, "Here is your money; get out." That is the same way, I think, here; the money could be returned, except such portions thereof as would have to be retained to meet current expenses that must be provided for first, and he must agree to that when he is accepted as a member. But I would not tie the hands of an Institute of this kind by a monetary consideration, that a man has any hold whatsoever by reason of any right you have given him, or by reason of any money he has invested therein. Make it so you can immediately get rid of any man that is obnoxious. Keep your escutcheon clear from all blots.

Mr. Mayo then stated that Prof. Arny had hit upon a medium which seemed to be full of promise, and was the first suggestion that seemed likely of solution of this very important problem, and one which had occurred time and time again in his state. At the state meeting

of the New York Pharmaceutical Association held in Saratoga Springs in June, a committee of ten was appointed to discuss this question of the separation of the sheep from the goats. He thought the proper solution of the question was one that required careful deliberation; that it was well worthy of a further study and moved that the proposal be referred to a sub-committee for consideration during the year, with instructions to report to this body. He again referred to the fact of the appointment of the committee in New York, and thought it quite likely that other committees had been appointed in other states.

Dr. Arny stated the idea of the paper was merely to present the subject that the members might think it over. He referred to the appointment of the committee in New York to look into this particular matter. In conclusion, he wished to say relative to Mr. Apple's criticism, that naturally the requirements of membership were purely tentative; that it was merely the thought he was trying to present, and therefore he would be most happy to go before the committee.

Dr. Apple, replying, said he wished Dr. Arny to understand that his remarks were not criticisms.

THE PHARMACY OF ADRENALIN.

C. P. BECKWITH.

Adrenalin has, to-day, a well-established place in the *materia medica*. In therapy, its field is large and expanding. Its chemistry and pharmacology have been studied elaborately. Of its pharmacy, however, comparatively little has been written. In dispensing this sensitive substance, there is much opportunity for error. I believe it a moderate estimate that of adrenalin-containing prescriptions met in actual practice, more than half are either ill-written or improperly compounded. In the present paper, it is proposed to discuss briefly the pharmacy of adrenalin, and, particularly, to suggest certain expedients and precautions favoring the conservation of its activity alone and in mixture.

The structural formula, when known, constitutes, perhaps, the most precise possible definition of a pure chemical compound. In the case of adrenalin, the formula has been established, beyond doubt, by both analysis and synthesis; for the sake of precision, therefore, let us define adrenalin as the *lævo*-rotatory isomer of the formula,

The *dextro*-rotatory isomer of the same formula, which has been found in the synthetic product only, is probably nearly or quite inert.

While this formula is before us, it is well to observe that the molecule contains groups that characterize it at once as an amine base, an alcohol and a phenol,—an observation that will help to a clearer understanding of its chemical behavior.

Adrenalin occurs naturally in the medulla of the suprarenal gland of warm-blooded animals, including man. Suprarenal glands of oxen, which are most readily obtainable in sufficient amount, supply the adrenalin of commerce. We

have no reason to doubt, however, that the natural substance is the same from whatever animal obtained.

Details of a process, identical in all essential points with that used on the manufacturing scale for the isolation of adrenalin from the gland tissue, may be found in an article by Dr. Takamine in the American Journal of Pharmacy, November, 1901.

Adrenalin of commerce, a nearly white micro-crystalline powder, is substantially pure, containing a very small fraction only of foreign matter. When properly stored, the pure crystals will remain unchanged for many years or perhaps indefinitely, but certain precautions should be observed as to the conditions of storage. Air, ammonia and certain other gases, moisture, strong light and heat, are in different degrees injurious. Under the combined action of air and moisture, adrenalin is decomposed rapidly. It is well, therefore, to store the product away from strong light and heat, in absolutely dry glass bottles or tubes, sealed air-tight. The drying of the container should be very thorough indeed, and, of course, the substance itself should be quite dry. A further precaution, superfluous however in ordinary practice, is to displace the air from the container with a dry inert gas. So protected and hermetically sealed, it is probable that adrenalin would prove absolutely permanent.

The pure substance is slightly soluble in cold water, and to a somewhat greater extent in hot water. Other ordinary simple solvents dissolve it very little, if at all, though aqueous solutions of certain salts have a marked solvent action. For instance, a strong aqueous solution of a borate, dissolves adrenalin abundantly, and borates prevent its precipitation by alkalies from solutions of its salts. Also, a strong aqueous solution of chemically neutral adrenalin chloride, will dissolve an appreciable amount of the adrenalin base.

In virtue of its phenol function, it forms water-soluble compounds with fixed caustic alkalies, but not with their carbonates nor with ammonia. Hence, from strong solutions of most of its salts, while the adrenalin base is partly precipitated by hydroxides or carbonates of strong alkalies, including ammonium, it is re-dissolved by excess of the fixed caustic alkalies only.

None of the solutions mentioned so far, is recommended for use in pharmacy, since in all, the adrenalin is oxidized rapidly on exposure to air.

In virtue of its amine function, adrenalin forms definite salts with the acids, usually very hygroscopic and difficult to preserve in dry form. They are in general very soluble in water and in alcohol, and these solutions may be made sufficiently stable for all ordinary uses. The salts are not very soluble in common simple solvents other than water and alcohol. For most pharmaceutical purposes, therefore, we are limited to the use of the salts of the base, in aqueous or alcoholic solution.

For instance, desiring to make an ointment containing adrenalin, the best practice is to prepare first, a concentrated aqueous solution of the chloride by dissolving adrenalin in the proper quantity of cold, moderately diluted hydrochloric acid, to incorporate the solution with sufficient lanolin, which as you know will take up much water, and to add, finally, whatever other ointment base may be prescribed. In case the prescribed fatty base, is miscible with sufficient alcohol,

it may infrequently be advisable to dissolve the adrenalin in the proper proportion of alcoholic, instead of aqueous, hydrochloric acid.

Very occasionally, ointments, suppositories, bougies, etc., containing adrenalin, are ordered, and the general method for ointments just outlined will suggest how they may be prepared.

Most commonly, however, aqueous solutions are prescribed; in fact commercial solution of adrenalin chloride, rather than the adrenalin base, is the usual starting point in prescription compounding. Some discussion is necessary, therefore, of the composition and properties of this preparation and of the precautions necessary to its conservation.

Commercial solution of adrenalin chloride contains one part per thousand of adrenalin chloride dissolved in physiologic salt solution with about one-half percent of chloretone. It is faintly acid in reaction, tastes of chloretone and salt, smells of chloretone, and, when fresh, is nearly colorless. Stored away from strong light and heat, with the seal unbroken, the solution will retain its activity for a long period. When, however, the stopper is removed and contact with air permitted, a new factor is to be considered. The oxygen of the air is destructive of adrenalin. Given good storage, the precaution most essential to the preservation of the commercial solution of adrenalin chloride, is to minimize contact with air. Only so much as is required for immediate use should be removed from the stock-bottle, which should be stoppered promptly and tightly. With ordinary care in handling, there is, within reasonable time, no necessity for serious loss through deterioration.

The oxidation that occurs upon undue exposure to air, is evidenced by change of color. The solution becomes pink, then red, then brown and a brown precipitate settles out. This fact is not without practical application since the color constitutes a rough, but fairly reliable index, of the potency of the solution. Experiments have been made to discover, if possible, some relation between the shade of color and the amount of deterioration. Solutions have been exposed freely to the air, the several changes of color observed, and physiological assays made from time to time. Of course, any quantitative statement based on personal estimate of a shade of color, is of necessity very crudely approximate. Bearing this in mind, however, and limiting the statement strictly to the undiluted commercial solution, we may say that so long as the color is not deeper in shade than what most persons would call pink, the loss of activity is practically negligible. When it becomes red, the loss of activity is quite measurable. It may amount to 10 or 20 percent of the whole. When brown, with the brown precipitate, the solution should be rejected, though even such solutions often retain considerable activity.

Aside from the physiological assay, which is too complicated for use in the pharmacy, I know of no entirely reliable assay method for adrenalin. Several colorimetric methods have been proposed, but there is none that I dare recommend as wholly accurate and trustworthy. The colors are often fleeting and vary in tint with the nature of the sample. Certain of the proposed reactions, also, are by no means specific for undecomposed adrenalin.

A rough qualitative test, to show the presence of active adrenalin in the commercial solution of adrenalin chloride of the composition already stated, is based on

its conduct with ferric chloride. As you are aware, ferric chloride gives striking and more or less characteristic color reactions with many of the phenols. Catechol, the parent phenol of adrenalin, gives, in dilute aqueous solution with a very little dilute ferric chloride solution, a brilliant green color, which, upon careful addition of very dilute alkali, passes through a series of color-changes from bluish-green to purple-red. Under like conditions, adrenalin acts similarly. The catechol nucleus is responsible for this reaction, so that it is not peculiar to adrenalin. If, however, dilute solutions of catechol and adrenalin chloride be treated with a little very dilute ferric chloride solution without subsequent addition of alkali, and if the two solutions be allowed to stand in the air for some minutes, a difference in their behavior will manifest itself. In the case of catechol, the green color persists; in that of adrenalin, it changes slowly to pink or red. While the test is not absolutely final, it is fair to conclude that a commercial solution of adrenalin chloride retains some activity when a sample, highly diluted, gives with a drop of very dilute ferric chloride solution a green color changing soon to pink or red. Many foreign substances interfere with the test, so that it may not be applicable to adrenalin in mixtures.

Having at hand a solution of adrenalin chloride known to be active, it remains to consider the precautions to be observed in dispensing it, alone and in mixture. Certain mixtures are chemically rational and therapeutically useful. If one is proposed, however, of whose feasibility there is doubt, let me counsel conservatism. Where possible, mixtures are best avoided; adrenalin is a sensitive substance, easily changed by many chemical reagents.

Chiefly to be feared, are alkalies and oxidizing agents. Almost any substance that, chemically, would be classed as an oxidizing agent, is more or less injurious to adrenalin. In this category are such substances as oxygen itself, free chlorine, bromine, iodine and their oxy-acids, permanganates, chromates, nitrites, salts of easily reducible metals, etc. Iron is extremely troublesome, because of its wide distribution and because a very minute amount will suffice to shorten measurably the life of an adrenalin solution. Traces of iron in other chemicals, in distilled water and even in glassware, are decidedly to be reckoned with. Of course, iron utensils should never be brought in contact with adrenalin.

Alkalies are no doubt destructive directly, but mainly they are pernicious, because they very greatly accelerate the destructive action of oxidizing agents. A faintly alkaline solution of adrenalin exposed to the air, will lose its activity very quickly. Such solutions are often prescribed, but ought not to be dispensed, unless confirmed by the physician after he has been informed of their instability. Every solution of adrenalin that is expected to retain its activity, should show a faint acid reaction. I am acquainted with no satisfactory expedient for preparing a stable adrenalin solution, that is not slightly acid. Organic acids and weak mineral acids are not very effective, unless present in considerable amount. A minute trace of a strong mineral acid, that is to say, a highly dissociated acid, is to be preferred.

In conformity with the last statement, the non-oxidizing acids, in reasonable dilution, are not injurious to adrenalin. Dilute sulphuric, sulphurous, hydrochloric, phosphoric, boric, salicylic, acetic, tartaric, citric,—in fact, most of the

acids commonly used in medicine,—are harmless. Oxidizing acids are of course objectionable.

Salts of the common alkaloids, of the alkali metals and, broadly, of the light metals generally, are not intrinsically harmful. If, however, their acid radicals are of weak,—that is to say, slightly dissociated,—acids, they may indirectly diminish the resistance of the adrenalin to oxidation by partial replacement of the trace of free strong acid normally present.

Phenols of the types of carbolic and cresylic acids are harmless. Ordinary camphors, terpenes, and similar bodies are not injurious, save in so far as they may be to a certain extent carriers of oxygen. Most aldehydes of high molecular weight, alcohols and ketones, are probably harmless. Formaldehyde, however, is directly destructive to adrenalin, and the two are wholly incompatible. As little as 1/10 of 1% of formaldehyde added to solution of adrenalin chloride will render it quite inert within a few hours.

In the foregoing statements of incompatibility, exhaustive accuracy is not pretended and doubtless there may be found exceptions. The purpose is merely to characterize certain broad types. An elaborate table of specific incompatibles, even were the data available, is beyond the scope of this paper.

To exemplify the use of these statements, and to emphasize some of the most important points, it will be well to examine and comment upon a few prescriptions. Some of these were submitted for criticism in the regular course of business; some are written arbitrarily to illustrate a particular case. All, however, are such as might be met with in the experience of any pharmacist.

1. \mathcal{R} Solution Adrenalin Chloride..... 1 fluidrachm

Let us begin at the beginning. This prescription requires only, that a fluidrachm be dispensed from stock, yet I venture to say that if filled carelessly, the solution will, in many instances, undergo deterioration far more rapidly than the same solution in the stock-bottle. Certain precautions are recommended that will apply not only to the present case, but to all prescriptions containing adrenalin. Either a glass-stoppered bottle should be used, or else the lower end of the cork should be covered with waxed tissue. The vial should be scrupulously clean and in particular it should be, as nearly as possible, free from alkali and iron in soluble form. It is advisable, therefore, to wash out all bottles with strong hydrochloric acid followed by much distilled water. This, however, is only a temporary expedient, and the best plan is to select an insoluble glass.

2. \mathcal{R} Sol. of Adrenalin Chloride..... 1 volume
Distilled water or physiologic salt solution..... 9 volumes

All the comments on the last prescription, apply equally to this. In addition, one should make sure that the distilled water or physiologic salt solution, is free from alkali and iron. It is a good plan, also, to use water or salt solution that has been freshly boiled and cooled. It has already been remarked that the commercial solution of adrenalin chloride is faintly acid,—a condition necessary to its stability. Here, this acidity is reduced, by dilution, to 1/10 its original proportion. In many ordinary bottles, there is sufficient soluble alkali to neutralize completely this trace of acid, and so to determine the rapid oxidation of the adrenalin. The life of this solution, therefore, would be greatly prolonged by the addition of chemically pure hydrochloric acid, in such proportion that the finished solution

contains about 1/100 of one percent of the absolute acid. Care should be taken that the acid itself is as nearly as possible free from iron, very appreciable amounts of which are present in many lots of, so-called, chemically pure hydrochloric acid.

Even when quite sterile at the outset, solutions like the one under consideration are liable to contamination in use. To prevent the development of fungus, a mild antiseptic may be added. Saturation with chloroform or chloretone would improve such solutions.

3. R	Adrenalin	$\frac{1}{4}$ grain
	Cocaine	5 grains
	Sodium chloride, C. P.	4 "
	Boric Acid.....	10 "
	Chloretone	$2\frac{1}{2}$ "
	Distilled water, sufficient to make.....	1 fluidounce

This solution would probably deteriorate fairly rapidly. There should be present some mineral acid stronger than boric. Very suitable would be hydrochloric acid, C. P. in quantity sufficient to saturate the adrenalin and cocaine, and leave an excess of about 1/100 of one percent of absolute acid in the finished solution. Also the boric acid should be free from iron,—an impurity very common in even the medicinally pure acid.

4. R	Sodium bicarbonate	
	Sodium borate	
	Sodium chloride, aa.....	2.5 grains
	Thymol	$\frac{1}{80}$ grain
	Sol. Adrenalin Chloride.....	1 fluidrachm
	Distilled water, sufficient to make.....	1 fluidounce

Nose and throat specialists sometimes order spray-solutions similar to this. Usually they are designed to be slightly alkaline, so that the addition of acid, even if otherwise advisable, would defeat the intention of the prescriber. In the present case, it would be almost useless to add hydrochloric acid, unless in quantity equivalent to the whole of the sodium bicarbonate and sodium borate. This is of course inadmissible. The remedy is, with the consent of the prescriber, to put up the adrenalin solution separately, instructing the patient to add, in proper proportion, to each dose of the spray-solution immediately before use. If dispensed as it stands, it will become inactive in a very short time.

5. R	Zinc sulphate.....	0.05 gramme
	Cocaine hydrochloride.....	0.2 "
	Adrenalin solution.....	10 drops
	Fennel water, B. P., sufficient to make.....	15. grammes

This prescription, dispensed by an English pharmacist on the order of an oculist, underwent marked deterioration within a few days. In reply to inquiry as to the cause, certain possibilities were pointed out. First, it is to be noted that the ten drops of adrenalin solution were diluted to about 15 cc., thus reducing the acidity of the adrenalin solution to such an extent that the trace of alkali yielded by most common glass bottles would be fatal. Further, zinc sulphate very often contains iron. This salt and, indeed, each of the ingredients, as well as the bottle itself, should be tested for iron. It is highly probable that one or both of these causes was accountable for the deterioration. The remedy would be to use materials and container as nearly as possible free from iron and alkali, and to add, as

already recommended, hydrochloric acid, C. P., up to 1/100 of 1 percent of the finished solution.

6. \mathcal{R} Mercuric chloride..... 4 grain
Sol. Adrenalin Chloride..... 2 fluidrachms
Water, sufficient to make..... 1 fluidounce

When this prescription was compounded by a pharmacist, there appeared, almost immediately, a slight grey precipitate, the solution becoming red. The precipitation was due, of course, to the reduction of the mercury, and the color, to the oxidation of the adrenalin. That the reaction occurred immediately, resulted, perhaps, from the use of slightly alkaline tap-water. Adrenalin chloride and mercuric chloride solution may be mixed, without immediate destructive reaction, if there is present a little free hydrochloric acid. Even with this precaution, however, the adrenalin is destroyed within a comparatively short time. This prescription should not be dispensed.

7. \mathcal{R} Cocaine hydrochloride..... 9 grains
Sol. Adrenalin..... 1½ fluidrachms
Iodine 4 grains
Cherry laurel water, B. P..... 2 drachms
Glycerin, q. s., to make..... 1 fluidounce

This prescription is copied from the Pharmaceutical Journal, Vol. 16, page 484, where it is condemned, because of the evident incompatibility between iodine and cocaine hydrochloride. It is further asserted, however, that the formula might be serviceable if the cocaine hydrochloride were omitted,—an obvious error since iodine is quickly destructive to adrenalin.

8. \mathcal{R} Adrenalin chloride..... 6 grains
Camphor 1 ounce
Phenol ½ ounce
Olive Oil..... 8 ounces

This formula is not practicable by reason of the comparative insolubility of adrenalin chloride in the mixture. A physician stated that a very similar prescription was being filled for him regularly. If so, it is probable that an examination of the product he was using would discover either the almost complete absence of adrenalin or the presence of ingredients not mentioned in the formula.

9. \mathcal{R} Solution Adrenalin chloride..... 1 fluidrachm
Sodium benzoate..... 1 grain

The trace of free hydrochloric acid of the adrenalin solution will be largely replaced by the less efficient benzoic acid. The solution will keep fairly well but will be less resistant to oxidation than the un-modified solution of adrenalin chloride.

To summarize in part,—the following considerations are of first importance in dispensing:

Deterioration of adrenalin solutions is usually due to oxidation, either by the oxygen of the air or by an added oxydizing agent.

Oxidation is retarded by acids, but accelerated by alkalies. Solutions alkaline in reaction, ought not to be dispensed.

In retarding oxidation, a trace of strong acid is, in general, more efficient than the equivalent amount of a weak acid. Solutions acidified with a trace of a weak acid, may be dispensed, but will not be very stable. Resistance to oxidation, other things being equal, seems to be a function of the number of hydrogen ions in a

unit volume of the solution. The acid should be used, therefore, not in proportion to the amount of adrenalin chloride present, but in proportion to the total volume of the finished solution. One one-hundredth of one percent of absolute hydrochloric acid, is a suitable proportion.

Prescriptions including oxidizing agents, should not be dispensed. Iron salts, in particular, are to be avoided. Containers, distilled water, and all materials entering into the prescription, should be as nearly as possible free from iron.

Glassware containing much soluble alkali should not be used.

Contact with air should be minimized.

WHAT PERCENT OF THE PRESCRIPTIONS DISPENSED IN YOUR STORE CAN YOU CONSCIENTIOUSLY DECLARE TO BE DISPENSED WITH FRESH DRUGS AND CHEMICALS?

CORNELIUS OSSEWARD.

The frequency with which we see druggists and very often pharmacists also, lay particular stress, in their advertisements, that nothing but absolutely fresh drugs and chemicals are used in dispensing, is my excuse in asking the above question.

Whenever I see such an advertisement or announcement, it reminds me of another too frequently in print, n. 1.

"PRESCRIPTIONS OUR SPECIALTY."

Our intentions may be good; we may think that we are dispensing fresh drugs; we may tell the dear public that we are specialists in dispensing, but will it stand investigation?

I am convinced that, under the present conditions, it is often impossible for the pharmacist to make such a statement and speak honestly, and that the firm using the largest sign "PRESCRIPTION SPECIALIST," or "PRESCRIPTIONS OUR SPECIALTY," do not possess a Pharmacopœia or National Formulary, and that the common utensils required in dispensing are conspicuous by their absence.

As there has been a great deal of that kind of advertising, which, after a little investigation could not stand the test, it is certainly refreshing to note the tendency for more honest and true statements.

Should we as pharmacists not be very careful how we advertise, how we write our copy? *Be sure* that you can *deliver* that which you promise.

In order to prove to you that we as pharmacists cannot at all times supply fresh drugs because we do not know about them, let me ask you,—

Are you giving your prescription stock as much attention as it requires?

Are you buying the right kind of stock in the right quantity? And are you taking proper care of this stock while in your possession?

Again, how long have these drugs and chemicals been on the jobbers' shelves? And how much care has the jobber given to the proper storing of his goods?

Is it not true that the average pharmacist, with the exception of the larger stores, buys mostly through the jobber, and it is therefore proper to ask whether the jobber looks after his stock, and stores it properly?

Again, the shipping of certain drugs, and especially the biologics, when subjected to great variation of temperature and climatic conditions, may soon become worthless.

Does the average pharmacist give due consideration to these important questions? If not, how can he say that the drugs he uses are absolutely fresh?

Again, does the average pharmacist understand or appreciate the value of proper storing? Does he know which drugs require the most care and attention to keep them in good condition?

At this time, and in this connection, it may be well to call attention to the fact that our Pharmacopœia does not give positive directions as to how some of the important drugs should be cared for and stored.

We may take *Digitalis Leaves* for example,—the only precaution given under *Digitalis*, is that the leaves should be collected from plants of second year's growth at the commencement of flowering.

It says nothing at all as to how these leaves should be stored. It does not state that the stems are worthless, and should be removed. No limit is given as to how long they may be kept on hand, notwithstanding the fact that it is well known that *Digitalis* leaves readily deteriorate, if not properly taken care of.

It is of interest to note how careful other Pharmacopœias are in this respect, when we read in them, under *Digitalis leaves*, the following cautions,—

"When *Digitalis* leaves are to be used, all stems must first be removed." "*Digitalis* leaves must not be kept longer than one year." "*Digitalis* should be freshly powdered whenever called for." "*Digitalis* leaves must be preserved by the use of unslaked lime."

Here then are explicit directions, as to how to keep it, how long to keep it, that the stems must not be used, and that the powder must be freshly powdered each time when called for. Following such precautions there is very little chance for having poor *Digitalis* leaves on hand.

Is it any wonder that Infusion *Digitalis* is practically worthless in a great many cases, not because it has not been properly made, but because the leaves were without any medicinal value?

And then we wonder why the physician prescribes some trade name article. Is it not because he failed to get results with the U. S. P. Infusion?

In our experience we have never failed to satisfy our physicians with getting results from Infusion *Digitalis*, prepared from leaves from which the stems were removed, and the preparation carefully preserved.

An investigation of commercial *Digitalis* preparations made by Weis, of Vienna, agrees with our experience, when he states that at present the best form in which to prescribe *Digitalis* is a freshly-made Infusion of physiologically-tested leaves.

He further states that of seventeen proprietary preparations examined, only three or four were of the strength stated, while others had only one-tenth the strength claimed for them.

If the crude material deteriorates so rapidly if not kept carefully, what about the preparations made from these drugs?

I have visited pharmacies where Fluid Extract and Tincture of *Digitalis* were stocked in gallon bottles, partly empty, the bottles covered with a thick layer of

dust, the dust proving without doubt that these bottles had not been disturbed for some time, and it would be interesting to find the activity of these preparations under such conditions.

Would it not be greatly to the interest of the patient if such preparations could not be purchased in such large amounts?

Here is where the pharmacist who manufactures his own galenicals has the great advantage, and can minimize such deterioration, by manufacturing only enough for his immediate wants, and renewing his stock frequently with a fresh supply.

So much for the simple galenical preparations.

What about the mixtures, the compound preparations, the ready-made prescriptions prepared for future use, instead of preparing them when needed? Can you always claim that these ready-made preparations are freshly prepared? Is it not true that you know nothing at all about when they were made, how long they have been in stock, and what changes of temperature they have been subjected to?

Is it reasonable to expect that these ready-made prescriptions distributed all over the country, very many of them consisting of several ingredients, are less liable to deterioration than the simple galenicals?

Is it not true that we know little regarding the influence of light and heat, and less of the chemical action in these organic compounds, and that for this reason only they should be prepared extemporaneously?

Have you ever examined your prescription file? Do you know the percent of these ready-made prescriptions prescribed? And do you know the percent of galenicals represented on your file?

I have taken the trouble to go over our files, and to get a fair average have taken 1000 prescriptions dispensed during June, and another 1000 dispensed during January.

I have here an itemized list of the proprietary preparations called for in these 2000 prescriptions, also the different U. S. P. and National Formulary products represented in these 2000 prescriptions. To read this list would take too much of our time. I will, therefore, give you the result in a condensed form, showing the number of times each class of preparations was called for in these 2000 prescriptions:

This then gives us two-thirds, or about sixty-seven percent, U. S. P. and N. F. products, and about one-third, or nearly 33 percent, ready-made preparations.

This is a fair average, and it would be interesting to compare this with several other prescription-files, in different parts of the U. S., to see if this average really does hold.

It shows, however, that in our locality at least, the pharmacist has control over two-thirds of the ingredients prescribed, and can assume responsibility, providing he does most of his own manufacturing, or buys in the proper quantity from reliable sources. But what about the other one-third? Can he take responsibility for that of which he knows nothing at all?

Can you conscientiously state that these goods are absolutely fresh, when you do not know how long they have been made?

Is there no remedy to overcome this unfair condition?

Should not the physician, and also the patient, know that the pharmacist is powerless, that he cannot assume responsibility for one-third of the products he is called upon to dispense under the present conditions?

The vigorous warfare which has been waged by the American Medical Association the last few years against various mixtures, has no doubt reduced the use of many of these ready-made mixtures. Has the pharmacist been as active, has he been conscientious at the prescription counter, has he done his full duty toward both the physician and the patient? Has he supported the splendid work carried on by the Medical Association?

If we, as pharmacists, are at all times careful in our buying, as to quality, and

also quantity; take proper care of our stock; manufacture our own galenicals in such quantity as needed, and dispense the prescriptions entrusted to our care faithfully, and honestly, I am sure that the use of these ready-made products will not be as popular in the future.

And it may be well to always remember that:—

The public will come to the pharmacist who can deliver *fresh goods*.

It is ready and eager to trust you if you will deliver *fresh goods*.

But don't take the prescription, and make out the bill,

Unless you are sure you'll be able to fill

That prescription, because it won't pay you until

You *deliver* Fresh Goods.

DISCUSSION.

Prof. Hynson said he was much interested in the subject of this paper and the point he wished to bring out was, that we must not condemn as ready-made, something that is really a definite chemical or a stable compound, even if it were proprietary. A great many of the compounds referred to are just like our elixirs, and there was no reason why they should be fresher than those.

Mr. Osseward replied that he had included some preparations that would keep for almost an indefinite time, and had only tabulated them for the main purposes of his paper.

Mr. Jones expressed himself as being very greatly interested in the subject as Mr. Osseward had treated it. He had had experience in the investigation of conditions of products in the average drug-store in many places. He had served as the Chairman of the Committee on Standards in his state (South Dakota), and had done work for its drug-department. He had called the attention of the Drug Commissioners to the fact that the condition throughout the state was not very favorable as to the freshness of drugs that were used in the compounding of medicines. The fault was not all with the retailer; he divided the responsibility with the jobbers, and, to some extent, with manufacturers. With the consent of the jobbers, an investigation had been made by the Drug Commissioners and it was found that a large percentage of the drugs, as they were sold to the retailer, were given little attention as to their freshness and purity. He thought that perhaps twenty-five percent of the drug trade in his state paid attention to the proper dispensing of drugs, and seventy-five percent paid very little attention to it. He thought this condition would hold good the country over. The condition to-day is much better throughout the country than three, four, or five years ago. He thought the druggists should pay special attention to the proper condition of their drugs and the proper storing of them, and that with the exercise of a little care a wonderful improvement could be made in their condition. He asked Mr. Osseward how long he would consider an Infusion of Digitalis fresh. Mr. Osseward replied that he was absolutely opposed to stock Infusion of Digitalis. It should be always freshly made.

Mr. Jones asked if the stems of the leaf should be removed from the standardized article before using? Mr. Osseward replied that in the standardized drug he had found but very few stems, and these he did not remove. Mr. Jones further inquired if Mr. Osseward would advocate the use of any other than standardized Digitalis. Mr. Osseward replied that he would not, especially for the infusion, for when the physician prescribed that preparation he looked for immediate results.

Mr. Hostmann inquired of Mr. Osseward as to his authority for his statements as to the deterioration of digitalis leaves. In his reply, Mr. Osseward said it was better to be on the safe side, and he would not use any digitalis that he knew to be over a year old. He had no definite authority for this, but he took this position from an excess of caution.

Mr. Hostmann said he had heard Prof. Hatcher, who had spent the best years of his life investigating the digitalis question, say that he had examined more than one sample of digitalis leaves that were quite old, some almost twenty years old, that had been carelessly kept in paper bags, and that these older drugs assayed better than samples that were only one

or two years old that had been properly cultivated, collected and stored. He practically stated that, as long as the digitalis leaves are all right when grown, they retain their strength for many years.

Prof. Hynson asked if Mr. Hostmann remembered what Dr. Hatcher had said about the permanency of preparations of digitalis? Mr. Hostmann replied that while it had been some time since the lecture he felt quite sure that the Professor stated that he had examined tinctures of digitalis more than ten years old, and that they showed no deterioration of strength,—that is they tested even better or at least as good when tested physiologically as those freshly prepared from selected leaves. The Professor's statement, with regard to the relative values of fluidextract and tincture had slipped his mind, but he was quite sure he had made the statement he quoted.

Mr. Hall agreed with Mr. Osseward as to the infusion of digitalis. If one would make a sample of the infusion and put it under observation, changes would be observed in it in twenty-four hours. It might retain its efficacy for a week or two, but it should be freshly prepared when prescribed. As to the deterioration of other preparations of the drug, he stated that some four to six years ago samples were collected for physiological testing by the University of Ann Arbor. He furnished for test a sample of fluidextract of digitalis which must have been nearly fifteen years old, and this sample showed the best results on test.

Mr. Becker stated that on the containers for Allen's digitalis leaves, was printed the statement of the results of their assay, and he asked how much regard should be paid to that statement.

Mr. Holzhauer said that this statement is made according to their own standard; that it would always or nearly always, come up to the regular standard or go above it. He did not believe that the trade should adopt everybody's standard as a standard for strength. He had seen samples of Allen's leaves that assayed almost twice their stated strength.

Prof. Hynson asked what system was in use by the members to indicate the age of a product. He would like to know how it was possible to tell whether one had fresh drugs in his store or not. Mr. Osseward said, the only way he could suggest was to buy the drugs direct. Mr. Hynson then inquired how, by looking at a container, one could tell the age of its contents? Mr. Osseward replied that there were a number of drugs for which there was not much call, and that he kept a fairly good index of his goods and at stated periods he went over those and in that way he got a very fair idea of how old his stock was. Another and a very important thing was to be careful of the amount of goods purchased. There were many things purchasable in quantity which had an attractive discount, yet he thought the rule to be followed in the purchase of certain goods, was not to purchase more than could be used in a certain number of months.

Dr. Wulling said, that while he could not answer Prof. Hynson's question directly yet he could advance this suggestion. At the University of Minnesota they had demonstrated that a qualified pharmacist can raise his own digitalis, that is the equal of Allen's or any other. Minnesota has a fair climate and any state that had a milder climate ought to be able to succeed better than Minnesota. They had been doing experimental work along this line for three or four years and much of the drug that they had raised had been converted into fluidextract and tincture, but they did not raise sufficient to supply all those who desired to experiment with it. They were cultivating it only for the purposes of education, but they had certainly determined that there was no difficulty in its cultivation, and those of the members who possessed a plot of land ten by fifteen feet in size can raise every year enough digitalis at least for one year. He advised, however, that tests should be made of the drug, both by the pharmacopœial assay and biologically. Possibly every one did not possess the facilities for the latter. Pharmacists in a city could cultivate a little plot of digitalis on the outskirts of the city, but he cautioned them that certain inexperienced botanists have exhibited a mild form of poisoning acquired by handling the drug. Another word of caution was this, that there are many who desire to cultivate medicinal plants who are not qualified by sufficient pharmaceutical training. It was not enough to possess agricultural knowledge but the one who cultivated digitalis should also be a pharmacist. They were advising persons not to attempt the cultivation of medicinal drugs unless they had some sort of pharmaceutical training.

Prof. Hynson said the point he wished to elucidate was that the time had arrived when druggists must have some way of knowing the date of the receipt of his drugs. Some months ago he had asked the receiving-clerks in both stores to date everything that they received. He did not have "August 24, 1914," put on the goods, but he had the stamps made this way, "8—24—4," in consecutive numbering and that told him the story. If anyone had a better suggestion than that he would like to have it explained. He referred to the statement of Mr. Osseward relative to fresh goods and invoices, and he said that his firm had taken an invoice several years ago and that invoice embraced 17,000 different articles. If there were some way to indicate when these articles were purchased it would be most desirable. A member stated that the system used by him was that of employing the first two figures to represent the month of purchase. If an article was purchased in January, he put a zero in front of the one, thus 01. If bought in August the mark on the goods would be "08." The month would be indicated by the first figures, then the next figures show the cost, and the next the day of purchase. Say that the figures are 081725, it will show that the goods were bought on the twenty-fifth of August and that they cost seventeen cents. Initials were added to show from whom the articles were purchased.

Mr. Apple said he had found it to be an advantage to combine the date with the cost-mark.

Chairman Nitardy explained the plan in use by his firm. In order to indicate the date on which any preparation was made, they used a numbering-stamp of which the first two numbers represented the year, and the last three numbers the day of the year;—thus, 14125 meant, the 125th day of the year 1914.

Mr. Osseward said that the main point sought to be brought out by his paper was that we must pay more attention to the storage of our goods.

Mr. Charles T. P. Fennell had occasion to buy some digitalis leaves in March of the present year and he wished to know the exact date of their importation. He ascertained that they were imported in July of 1913, while the jobber from whom he purchased them assured him that they came over in April, 1912. Consequently the stamp did not always accurately indicate the age of the drug. He then asked Dr. Wulling to give them more details as to the cultivation of digitalis in Minnesota.

Dr. Wulling said that they had investigated the matter from different points of view and had made many ash-determinations. The first year's crop met every requirement of the Pharmacopœia. Their results had been remarkable. He had been asked by a number of gentlemen for information regarding the cultivation of this drug and while he did not wish to thrust himself into the discussion, he would be willing to give brief information regarding their experiments if it was so desired.

Mr. Jones inquired if Dr. Wulling would advise the growing of digitalis by pharmacists. Dr. Wulling replied that he could only say, they had tried it in Minnesota with success. He, therefore, would deduce the probability of success elsewhere.

They did not plant the seed in the open. They began indoors in March, in order to have the plants of sufficient size to mature during the first year. In an adjoining room were a number of samples, fifteen or twenty, grown in their medicinal garden. All digitalis whether home-grown or otherwise, should be tested to see that it met the pharmacopœial requirements. A physiological test could be very easily made if one knew how to make it.

Mr. Meyer advised the labelling of infusion of digitalis with a "Shake" and "Keep in a growing the plant in Brooklyn, N. Y., and getting very good results from the first year's crop, sowing the seed out-of-doors. They recently had a demonstration in New York City that was rather interesting, made by two senior students of the College of Pharmacy. These students were sent to Dr. Hatcher for four lessons in pharmacological assaying. They described Dr. Hatcher's methods and they appeared to present no difficult problems.

Mr. Meyer advised the labelling of infusion of digitalis with a "Shake" and "Keep in a Cool Place" labels. He was gratified to learn from Mr. Osseward's paper that sixty-seven percent of the prescriptions described there were for official preparations. This he thought was very encouraging.

FILLING CAPSULES—A SUGGESTION.

FRANKLIN M. APPLE, PHAR. D.

Anyone who has been called upon to fill into capsules dry powders realizes the difficulty that one experiences when endeavoring to place large amounts of bulky medicines, such as Cinchonidia Salicylate, in a small-sized capsule, and this can readily be demonstrated by the trouble one encounters when ten grains of this chemical is directed to be dispensed in the smallest-sized capsule possible to contain it.

The commonplace method of filling capsules with medicines in a dry state consists of forcing the powder into the two ends of the empty capsule by repeated plunging of the halves of the capsule into the powder, and then trying to force the two portions together, which oftentimes results in the ends of the capsule being crushed in, due to the condition of the powder therein contained.

By proceeding as has been customary to fill the two ends of the capsule, and placing them together with gentle twisting thereof, so that the two ends overlap somewhat, we are ready to utilize the suggestion here offered as follows:—Place the capsule between the thumb and forefinger of one hand, the ends of the capsule being the portions of the same in contact with one's body, then proceed to rotate the capsule with the forefinger and thumb of the other hand, pressing upon the body of the capsule to as great an extent as is allowable, whilst rotating it, which results in the powder being forced into the remotest portions of the capsule's ends, displacing the air that had been confined therein by the previous method of forcing the powder into the confined space, thereby fortifying the film of gelatine that constitutes the ends of the finished capsule, so that greater pressure can be placed thereon from outside without danger of crushing in the end.

Assuredly, as the space occupied by the undesired air is now filled with powder, more of the latter can be placed therein, or the space occupied by the former amount of medicine will be less than it was before the capsule was subjected to the proposed treatment.

It is really surprising how much one can reduce the bulk of a powder when resorting to this method of filling capsules therewith in a dry state.

DISCUSSION.

Mr. Apple illustrated his method of filling capsules. In order to remove the objection to the capsule coming in contact with moist fingers, he suggested covering the fingers at points of contact with court-plaster.

The Chairman said that the paper demonstrated how many little points there were in the practice of Pharmacy that were helpful and of value to every one. It was seldom that these little things were thought of enough importance and value to be brought out in a paper.

Prof. Hynson asked Mr. Apple if the substances used were always powdered, before filling the capsules, and was informed that the writer always dispensed the powder in a fine state of sub-division. Another question by the same gentleman was, as to the amount of powder he placed in the capsule. Mr. Apple said that he filled the capsules with just as much powder as he could get into each end. Mr. Hynson queried whether, if the capsules are filled by the powder, so that the cap will not occupy the place it did on the empty capsules, if Mr. Apple would dispense them that way? Mr. Apple replied that he could always force the capsule together so that it was entirely closed. Mr. Hynson said that he had noticed that some dispensers would use, for instance, a No. 2 capsule, and after filling would dispense it of the same length as a No. 1. He wished to ascertain as to the general practice regarding this matter.

UNITED STATES PHARMACOPŒIA.

NINTH REVISION.

ABSTRACT OF PROPOSED CHANGES WITH NEW STANDARDS AND DESCRIPTIONS.

Copyright, 1914, by the Board of Trustees of the United States Pharmacopœial Convention.*
All Rights Reserved

PART VI—FIRST PROOF.

A sixth installment of the Abstract of proposed new descriptions and standards, and of changes in descriptions and standards is herewith submitted.

This Abstract embraces a miscellaneous group of pharmacopœial articles and includes most of those which have not already been published in abstracted form.

Where no reference is made to rubrics, formulas, directions, tests, or assays, it is understood that the material facts remain the same as in the United States Pharmacopœia, Eighth Revision.

Comments should be sent to the Chairman of the Revision Committee, Joseph P. Remington, 1832 Pine street, Philadelphia.

Acidum Citricum.—Melting point omitted. Added tests: An aqueous solution of Citric Acid (1 in 10), which has been nearly neutralized with ammonia water, remains clear on the addition of calcium sulphate T. S. (oxalic acid). Heat about 5 Gm. of powdered Citric Acid for fifteen minutes on a water-bath with 5 Cc. of sulphuric acid in a porcelain dish, which has been previously rinsed with sulphuric acid, keeping the mixture protected from dust. No darker color than yellow develops (tartaric acid). Dissolve 10 Gm. of Citric Acid in 20 Cc. of distilled water, add 2 Cc. of sulphurous acid and boil the mixture until the odor of sulphur dioxide is barely perceptible. Cool the solution, mix it with 1 Cc. of a solution of sodium cyanide in distilled water (1 in 10) and follow this immediately with stronger ammonia water until the solution possesses a slight odor of ammonia. When cold, transfer the solution to a glass-stoppered cylinder of practically colorless glass, graduated at 50 Cc., dilute with sufficient distilled water to measure 50 Cc. and add 3 drops of a solution of sodium sulphide in distilled water (1 in 10). After mixing the solution well, the color produced, if any, when viewed downward against a white surface, is not greater than the color of a solution prepared as follows: To prepare the solution for the blank test, dissolve 3 Gm. of ammonium chloride (conforming to the tests for purity described in the Appendix), in 20 Cc. of distilled water, add 4 Cc. of a solution containing 0.080 Gm. of lead nitrate in 1000 Cc. of distilled water, and then 1 Cc. of diluted hydrochloric acid. Treat this solution with sulphurous acid, sodium cyanide and stronger ammonia water, then dilute and mix with sodium sulphide

* Permission to reprint for purposes of comment can be had on application to the Chairman of the Board of Trustees, J. H. Beal, 801 W. Nevada St., Urbana, Ill.

as described above. Before adding the sodium sulphide solution, the liquid must possess a distinct odor of ammonia. The two cylinders used must be matched and must be of practically colorless glass and have the same internal diameter (lead).

Acidum Hydriodicum Dilutum.—Rubric changed from “not less than 10 percent.” to “not less than 9.5 percent. nor more than 10.5 percent.” Added test: Mix 0.5 Cc. of Diluted Hydriodic Acid with 10 Cc. of distilled water, add 8 Cc. of silver nitrate T. S. and 6 Cc. of ammonium carbonate T. S., digest the mixture for 10 minutes on a bath of boiling water, cool, and filter. The filtrate, upon supersaturating with nitric acid, should not become more than slightly opalescent (chloride). Residue of 8.3 percent. on evaporation changed to 3 percent. on evaporation and ignition at low red heat.

Acidum Hydrobromicum Dilutum.—Rubric changed from “not less than 10 percent.” to “not less than 9.5 percent. nor more than 10.5 percent.” Residue on evaporation changed from “no appreciable residue from 10 Cc.” to “not more than 0.0025 Gm. from 25 Cc.” *Assay.*—Weigh accurately about 20 Cc. of Diluted Hydrobromic Acid, dilute it with 30 Cc. of distilled water, and titrate with normal potassium hydroxide V. S., using methyl-orange T. S. as indicator.

Acidum Hydrochloricum.—Rubric changed from “31.9 percent.” to “not less than 31 percent. nor more than 33 percent.”

Acidum Hydrochloricum Dilutum.—Rubric changed from “10 percent.” to “not less than 9.5 percent. nor more than 10.5 percent.”

Acidum Hypophosphorosum.—Rubric changed from “30 percent.” to “not less than 30 percent. nor more than 32 percent.”

Acidum Hypophosphorosum Dilutum.—Rubric changed from “10 percent.” to not less than 9.5 percent. nor more than 10.5 percent.” Added test: Neutralize a portion of the Acid with ammonia water, filter and render the filtrate alkaline with ammonia water; it shows no turbidity with calcium chloride T. S. Modified test: 6 Cc. of Diluted Hypophosphorous Acid with 3 Cc. of nitric acid, and 10 Cc. of distilled water, evaporated to dryness on a water bath, should not respond to the arsenic test.

Acidum Nitricum.—Rubric changed from “68 percent.” to “not less than 67 percent. nor more than 69 percent.”

Acidum Phosphoricum.—Rubric changed from “85 percent.” to “not less than 85 percent. nor more than 88 percent.”

Acidum Phosphoricum Dilutum.—Rubric changed from “10 percent.” to “not less than 9.5 percent. nor more than 10.5 percent.”

Acidum Sulphuricum.—Rubric changed from “not less than 92.5 percent.” to “not less than 93 percent. nor more than 95 percent.”

Acidum Sulphuricum Dilutum.—Rubric changed from “not less than 10 percent.” to “not less than 9.5 percent. nor more than 10.5 percent.”

Acidum Tartaricum.—Melting point omitted. Added test: Dissolve 10 Gm. of Tartaric Acid in 20 Cc. of distilled water, add 2 Cc. of sulphurous acid and boil the mixture until the odor of sulphur dioxide is barely perceptible. Cool the solution, mix it with 1 Cc. of a solution of sodium cyanide in distilled water

(1 in 10) and follow this immediately with stronger ammonia water until the precipitate formed is redissolved and the solution has a slight odor of ammonia. When cold, transfer the solution to a glass-stoppered cylinder of practically colorless glass, graduated at 50 Cc. Dilute it with sufficient distilled water to measure 50 Cc. and add 3 drops of a solution of sodium sulphide in distilled water (1 in 10). After mixing the solution well, the color produced, if any, when viewed downward against a white surface is not greater than the color of a solution prepared as follows: Dissolve 2 Gm. of ammonium chloride (conforming to the tests for purity described in the Appendix), in 20 Cc. of distilled water, add 4 Cc. of a solution containing 0.080 Gm. of lead nitrate in 1000 Cc. of distilled water, and then 1 Cc. of diluted hydrochloric acid. Treat this solution with sulphurous acid, sodium cyanide and stronger ammonia water, then dilute and mix with sodium sulphide as described above. Before adding the sodium sulphide solution, the liquid must possess a distinct odor of ammonia. The two cylinders used must be matched, must be of practically colorless glass, and have the same internal diameter (lead).

Adeps Benzoïnatus.—10 Gm. of Siam Benzoin directed instead of "20 Gm. of Benzoin."

Aether.—Rubric changed from "about 96 percent." to "from 95.5 percent. to 97.5 percent., by weight of ethyl oxide." Added requirement: Ether for anesthesia is to be dispensed only in small, well closed containers and is not to be used as an anesthetic after the original container has been open twenty-four hours. Specific gravity: changed from "0.716 to 0.717" to "from 0.713 to 0.716" at 25° C. Boiling point changed from "about 35.5° C." to "about 35° C." Added description: It is slowly oxidized by the combined action of air, moisture and sunlight with the formation of peroxides, which produce explosive compounds. Modified tests: The moist residue left on the spontaneous evaporation of 25 Cc. of Ether from a shallow dish is odorless and neither reddens nor bleaches blue litmus paper. Dried at 100° C., this residue does not exceed 0.001 Gm. On shaking 10 Cc. of Ether occasionally during one hour with 1 Cc. of potassium hydroxide T. S. in a glass-stoppered tube, protected from light, no color is developed in either liquid (aldehyde). Added test: Shake 10 Cc. of Ether occasionally during one hour with 1 Cc. of a freshly made solution of cadmium potassium iodide (1 in 10) in a glass-stoppered cylinder, previously rinsed with the Ether under examination and protected from light; no color is developed in either liquid (peroxides). Test for undue amount of alcohol or water omitted.

Aqua Hamamelidis.—Process omitted. New description: A saturated aqueous distillate obtained by distilling hamamelis bark with steam or water and containing not less than 14 percent. by volume of absolute alcohol. Clear and colorless, or not more than faintly opalescent or slightly yellowish liquid having a characteristic aroma and taste. Added tests: Neutral or only faintly acid to litmus. Specific gravity: 0.979 to 0.982 at 25° C. Free from mucilaginous or fungus growths or an acetous odor. It gives no reaction with hydrogen sulphide T. S. or with ammonium sulphide T. S. (metallic impurities). Not more than 0.025 Gm. of residue remains on evaporating 100 Cc. to dryness on a water bath (limit of

dissolved impurities). Assay for alcohol content by general method in Appendix. Add 8 drops of an aqueous solution of resorcinol (1 in 200) to 5 Cc. of Hamamelis Water, and then carefully pour this upon 5 Cc. of sulphuric acid, contained in a test-tube, in such a manner that the two liquids do not mix. After standing 3 minutes a rose-red ring should not appear at the line of contact of the liquids nor should a distinct, white layer appear above this zone (formaldehyde). Ten Cc. of Hamamelis Water should give no reaction for methyl alcohol when treated according to the test given under alcohol for the detection of methyl alcohol.

Aspidosperma.—The dried bark of *Aspidosperma Quebracho blanco*, Schlechtendal (Fam. Apocynaceæ), without admixture of more than 2 percent. of wood and other foreign matter. In irregular chips or in longitudinal pieces attaining a length of 14 cm. and a thickness of 35 mm.; outer corky layer from 3 to 35 mm. in thickness, brownish-gray or reddish-brown and deeply furrowed, frequently somewhat reticulate with longitudinal and shallow transverse fissures, the crevices being occasionally lined with the mycelia of a grayish mould; outer surface of bark from which the cork has been separated, light reddish-brown and usually more or less roughened; inner surface occasionally with adhering wood, otherwise light yellowish-brown to light reddish-brown, longitudinally finely striate and finely porous; fracture short-fibrous with projecting bast fibers; nearly inodorous, taste bitter and slightly aromatic. Under the microscope transverse sections of *Aspidosperma* show a number of successive layers of cork separated by large groups of stone cells, isolated bast fibers and parenchyma; inner bark with starch-bearing medullary rays 1 to 5 cells in width, separating narrow wedges composed of large prominent groups of stone cells in which are occasionally included one or more thick walled bast fibers; bast fibers usually single, very thick walled, strongly lignified and surrounded with crystal fibers and starch-bearing parenchyma. Powder: Reddish-brown, bast fibers single, very long and surrounded by crystal fibers, the crystals being in prisms frequently terminated by pyramids and from 0.008 to 0.030 mm. in length; stone cells in large thick groups composed of numerous more or less tabular cells; cork cells more or less polygonal in outline with thick, slightly lignified walls; starch grains single or 2 to 4 compound, the individual grains spherical, ovoid or more or less planoconvex, from 0.003 to 0.025 mm. in diameter.

Calcii Glycerophosphas.—The normal calcium salt of glycerophosphoric acid containing not less than 90 percent. of anhydrous normal calcium glycerophosphate. A fine white powder, odorless and almost tasteless, somewhat hygroscopic. One Gm. dissolves in about 50 Cc. of water at 25° C.; soluble in less water at a lower temperature; the presence of citric acid increases its solubility; insoluble in alcohol. An aqueous solution shows an alkaline reaction to litmus and to phenolphthalein. A cold, saturated, aqueous solution yields white, iridescent scales of anhydrous Calcium Glycerophosphate when heated to boiling. When heated above 170° C. the salt is decomposed, evolving inflammable vapors and at a red heat is converted into calcium pyrophosphate. A saturated aqueous solution of the salt yields with ammonium oxalate T. S. a white precipitate, insoluble in acetic acid but soluble in hydrochloric acid. With lead acetate T. S. the

saturated solution yields a white precipitate which is soluble in nitric acid. Dissolve 1 Gm. of Calcium Glycerophosphate in 10 Cc. of diluted nitric acid and add an equal volume of cold ammonium molybdate T. S.; no precipitate should be formed within one hour (phosphates). On heating the mixture, however, a yellow precipitate will be formed. Ten Cc. of an aqueous solution of the salt (1 in 100) in water, acidified with a few drops of hydrochloric acid, does not respond to the test for heavy metals. Dissolve 0.1 Gm. of the salt in 10 Cc. of diluted nitric acid and add 1 Cc. of silver nitrate T. S.; a distinct opalescence may appear but no precipitate within one minute (chloride). Dissolve 0.1 Gm. of the salt in 10 Cc. of diluted hydrochloric acid and add 1 Cc. of barium chloride T. S.; no distinct turbidity appears within one minute (sulphate). Shake 1 Gm. of finely powdered Calcium Glycerophosphate with 25 Cc. of absolute alcohol, filter the mixture, evaporate the filtrate on a water bath and dry the residue for an hour at a temperature not exceeding 70° C. The resulting residue does not weigh more than 0.01 Gm. (limit of alcohol, soluble impurities, etc.). Weigh accurately from 0.5 to 1 Gm. of the finely powdered salt and dry it to constant weight at a temperature of 130° C.; the loss does not exceed 10 percent. (limit of water). Weigh accurately about 0.4 Gm. of the salt, previously dried to constant weight at 130° C., dissolve it in 20 Cc. of a 5 percent. solution of acetic acid and add 30 Cc. of distilled water. Heat the mixture to boiling and add an excess of ammonium oxalate T. S. Collect the resulting precipitate, wash, dry, and then ignite it until of constant weight. This residue of calcium oxide weighs not less than 23.47 percent. of the weight of Calcium Glycerophosphate taken. Weigh accurately about 1 Gm. of Calcium Glycerophosphate and ignite it to constant weight; the resulting residue of calcium pyrophosphate weighs not less than 54.4 percent. of the amount taken.

Ceratum.—White Petrolatum omitted; new formula: White Wax, 300 Gm., Benzoinated Lard, 700 Gm.

Ceratum Cantharidis.—Cantharides, in No. 60 powder, 350 Gm., Glacial Acetic Acid 25 Cc., Oil of Turpentine 150 Cc., Yellow Wax 175 Gm., Rosin 175 Gm., Benzoinated Lard 200 Gm. To make 1000 Gm. Macerate the Cantharides for 48 hours in a warm place, in a covered container, with the mixed Oil of Turpentine and Glacial Acetic Acid. Melt together the Rosin, Yellow Wax and Lard, add the macerated Cantharides and heat the mixture on a water-bath, with occasional stirring, until it weighs 1000 Gm. Finally stir until firm. Formerly 320 Gm. of Cantharides were macerated with 150 Gm. of Liquid Petrolatum for 48 hours under the same conditions, the mixture was then added to the melted Rosin, Wax and Lard and heated for one hour on a water-bath before cooling.

Collodium Flexile.—New formula: Collodion 950 Gm., Camphor 20 Gm., Castor Oil 30 Gm. To make 1000 Gm. Weigh the ingredients, successively, into a tared bottle and shake the mixture until the Camphor is dissolved.

Cresol. — Modified definition: A mixture of the isomeric cresols ($C_6H_4CH_3OH$) obtained from coal tar. Specific gravity changed from "1.036 to 1.038" to "from 1.030 to 1.038" at 25° C. One Cc. of Cresol dissolves in about 50 Cc. of water, usually forming a cloudy solution; it is miscible with alcohol, ether, benzene, petroleum benzin, and glycerin; it is soluble in solutions

of the fixed alkali hydroxides. Added test: A saturated, aqueous solution of Cresol becomes blue-violet on the addition of ferric chloride T. S. and is neutral or shows a slightly acid reaction to litmus. Modified test: A solution of 1 Cc. of Cresol in 60 Cc. of water shows not more than slight turbidity (hydrocarbons).

Elixir Aromaticum.—No change.

Elixir Adjuvans.—Title changed to Elixir Glycyrrhizæ and the amount of Fluidextract of Glycyrrhiza changed from 120 Cc. to 125 Cc. per 1000 Cc.

Emplastrum Belladonnæ.—Process omitted. Rubric changed from "not less than 0.38 percent. nor more than 0.42 percent. of mydriatic alkaloids" to "30 percent. of extract of belladonna leaves and yielding not less than 0.35 percent. nor more than 0.40 percent. of mydriatic alkaloids." It may be made with a vehicle of rosin plaster or rubber adhesive plaster. *Modified Assay*: Remove the cloth from the face of the plaster and introduce 10 Gm. of the spread plaster cut into strips, into a flask, add 50 Cc. of chloroform, and shake it until the plaster is dissolved. Pour the chloroform solution into a 250 Cc. beaker and wash the cloth upon which the plaster was spread, and which is in the flask, with two portions of 25 Cc. each of chloroform, adding the washings to the chloroform solution in the beaker. Then wash this cloth with 80 Cc. of alcohol containing 1 Cc. of ammonia water and pour the washings into the chloroform solution in the beaker. Stir the mixture gently and allow it to stand until the rubber has separated into a compact mass. Dry the cloth upon which the plaster was spread, weigh it and subtract its weight from the original weight of the plaster. Pour the chloroform-alcohol solution into a 350 Cc. separator, rinse the beaker and rubber with 10 Cc. of alcohol and add the rinsing to the separator. Then add to the separator 100 Cc. of water, rotate the mixture until thoroughly mixed and allow it to stand until the liquids separate. Then draw off the chloroform into a second separator containing 50 Cc. of water, shake it thoroughly and after separation draw off the chloroform into a beaker and pour the aqueous solution into the first separator. Return the chloroform solution to the second separator and shake out the contents of the first separator with two portions of 10 and 5 Cc. each of chloroform, adding them to the chloroform in the second separator. Completely extract the alkaloids from the chloroform solution by shaking it out repeatedly with weak sulphuric acid. Collect the acid washings in a separator and add ammonia water until the solution is decidedly alkaline to litmus, and completely extract the alkaloids by shaking out repeatedly with chloroform. Filter the chloroform solution through a pledget of cotton, evaporate it to dryness and dissolve the alkaloids from the residue in exactly 5 Cc. of tenth-normal sulphuric acid V. S., and titrate the excess of acid with fiftieth-normal potassium hydroxide V. S., using cochineal T. S. as indicator. Each cubic centimeter of tenth-normal sulphuric acid V. S. consumed, corresponds to 28.92 milligrammes of mydriatic alkaloids.

Emplastrum Cantharidis. — Cantharides Cerate, Rosin Plaster spread on fabric, each, a sufficient quantity. Prepare Cantharides Plaster by spreading cantharides cerate upon rosin plaster, leaving a margin around the edges. Each square centimeter of spread plaster is to contain 0.1 Gm. of cantharides cerate.

It may also be spread on muslin, paper, or other suitable material. It should be made extemporaneously.

Emplastrum Capsici.—No change.

Emplastrum Plumbi.—Lead Oxide 1000 Gm., Olive Oil 1000 Gm., Lard 1000 Gm., Boiling Water, a sufficient quantity. Heat the Olive Oil and Lard in a bright copper or other suitable vessel of a capacity of not less than four times the bulk of the ingredients, sift the Lead Oxide through a No. 80 sieve upon the surface of the hot liquid and mix thoroughly. Then gradually add 350 Cc. of Boiling Water, and continue the boiling, constantly stirring with a wooden spatula, and adding sufficient boiling water, from time to time, to replace that lost by evaporation until the mass is homogeneous and a small portion removed and dipped into cold water is found to be pliable and tenacious. Then remove from the fire and wash several times with warm water to remove the glycerin. Finally knead the mass until it is free from water, roll it into cylindrical forms of suitable size, and wrap them in paraffined paper.

Emplastrum Resinæ.—Rosin, in fine powder, 140 Gm., Lead Plaster, 800 Gm., Yellow Wax 60 Gm. To make 1000 Gm. Melt the Lead Plaster and Yellow Wax together with a gentle heat, then add the Rosin and, when melted, mix thoroughly, strain, and allow it to cool, stirring until it stiffens.

Extractum Physostigmatis Pulveratum.—It yields not less than 1.7 percent. nor more than 2.3 percent. of the alkaloids of Physostigma. One gramme of the Powdered Extract to represent 13 Gm. of average strength Physostigma. Exhaust 1000 Gm. of Physostigma, in No. 60 powder, by percolation first using 1000 Cc. of alcohol, 3 volumes, and water, 1 volume, in which 5 Gm. of Tartaric Acid has been dissolved, and continuing with Alcohol, 3 volumes, water, 1 volume. Distil the alcohol from the percolate, at as low a temperature as possible, and evaporate at not more than 80° C. to 200 Cc. Wash this residue with two portions (250 Cc. and 200 Cc. respectively), of purified petroleum benzin, evaporate the washed residue to pilular consistence, at a temperature not exceeding 80° C., incorporate 20 Gm. of starch and dry in warm air. Dry, powder, assay, and add a sufficient quantity of Starch. Former process directed exhaustion with Alcohol, evaporation of percolate to dryness on water bath, assay and dilution with a sufficient quantity of powdered glycyrrhiza.

Extractum Viburni Prunifolii Pulveratum.—One gramme of the Powdered Extract to represent 5 Gm. of Viburnum Prunifolium. Exhaust 1000 Gm. of Viburnum Prunifolium in No. 30 powder, with Diluted Alcohol. Distil the alcohol from the percolate at as low a temperature as possible, evaporate, at not more than 80° C. to a soft extract, incorporate 5 Gm. of magnesium oxide and dry on glass plates in warm air. Powder and add sufficient starch to make 200 Gm.

Fluidextractum Aspidospermatis.—Use No. 30 powder, and prepare by Type Process B, using a mixture of 110 Cc. of Glycerin, 670 Cc. of Alcohol and 220 Cc. of Water as Menstruum I, and a mixture of two volumes of Alcohol and one volume of Water as Menstruum II.

Fluidextractum Cascarae Sagradae Aromaticum. — New formula: Cascara Sagrada 1000 Gm., Magnesium Oxide 125.0 Gm., Pure Extract of Glycyrrhiza 40.0 Gm., Glycerin 200.0 Cc., Alcohol 250.0 Cc., Benzosulphinide 1.0 Gm.,

Oil of Anise 2.5 Cc., Oil of Cassia 0.2 Cc., Oil of Coriander 0.1 Cc., Oil of Betula 0.2 Cc., Boiling Water, a sufficient quantity, to make 1000 Cc. Mix the Cascara Sagrada with the Magnesium Oxide, moisten with 2000 Cc., of Boiling Water, stirring occasionally during 2 hours, and percolate with Boiling Water until the drug is exhausted. Evaporate percolate to 500 Cc., and while warm, dissolve in it the Pure Extract of Glycyrrhiza. When cold, add the Glycerin, then the Alcohol containing the Benzosulphinide and the Oils and then add sufficient Water to make 1000 Cc.

Fluidextractum Scilla.—Macerate 1000 Gm. of Squill, in No. 20 Powder, for 2 hours, with sufficient of a mixture of 2000 Cc. Alcohol, 1000 Cc. Water in a tightly-covered vessel. Then shake down evenly in a percolator, add more of the same menstruum and, when saturated, macerate 48 hours. Now percolate slowly, using same strength menstruum, to obtain 1000 Cc. of percolate. Again macerate drug in percolator for 12 hours, afterwards collecting a second 1000 Cc. of percolate. Again macerate for 12 hours and collect a third percolate of 3000 Cc. Distil the alcohol from the mixed percolates at as low a temperature as possible, and evaporate the liquid to 800 Cc. Slowly add to this residue when cold, with continuous agitation, 2000 Cc. of Alcohol and set aside, tightly closed for 12 hours. Decant supernatant liquid from syrupy layer, filter decanted liquid and wash syrupy residue with two portions, 300 Cc. each, of a mixture of alcohol 4 volumes, water 1 volume, passing the washings through the filter into the previously collected alcoholic liquid. Reduce the combined alcoholic liquids, by distillation, to 800 Cc. and add Diluted Alcohol to make 1000 Cc. Former process directed extraction with a mixture of Acetic Acid 275 parts and water 725 parts, and evaporation to 1000 Cc.

Gelatinum.—Modified description: An amorphous solid, in sheets, flakes, ground, powdered or shredded form, colorless or slightly yellowish, and having a slight characteristic odor and taste; unalterable in the air when dry, but decomposing when moist or in solution. Modified test: A hot solution of Gelatin in distilled water (1 in 40) should be free from putrid odor, and is not more than slightly acid to litmus; it appears not more than slightly opalescent in a stratum of 2 cm. and on cooling to 6° C. and standing for several hours it forms a firm, transparent or translucent jelly. Ash changed from 2 percent. to "not more than 3 percent." Added tests: A solution of the ash in 25 Cc. of distilled water, made with the aid of heat and a few drops of hydrochloric acid, does not respond to the Test for heavy metals. Heat 1.5 Gm. of Gelatin with 30 Cc. of hydrochloric acid (1 in 4) in a 150 Cc. Erlenmeyer flask on a water bath, and when the Gelatin has dissolved, add 3 Cc. of saturated bromine water and heat it on a water bath for 15 minutes, shaking the flask occasionally. Then add 0.5 Gm. of potassium iodide and follow it immediately with 0.5 Cc. of a 25 percent. solution of stannous chloride. Heat the solution for 5 minutes on a water bath, cool and subject it to the test for Arsenic. The stain produced, if any, is not greater than that produced in a test made with the same quantities of the reagents to which 2 Cc. of the standard arsenic solution has been added.

Glucosum.—The product obtained by the hydrolysis of starch, consisting chiefly of dextrose and dextrans. A colorless or slightly colored, thick, syrupy

liquid. Odorless or nearly so; it has a sweet taste. Very soluble in water, sparingly soluble in alcohol. An aqueous solution is neutral or slightly acid to litmus. Add a few drops of an aqueous solution (1 in 20) to 5 Cc. of hot alkaline cupric tartrate T. S.; a copious red precipitate of cuprous oxide will be produced (distinction from cane sugar). Weigh accurately about 0.5 Gm. of Glucose in a wide, glass-stoppered, tared weighing bottle, add 2 Cc. of distilled water, evaporate the water at about 70° C. and then dry it to constant weight at 90° C. The loss in weight of the Glucose does not exceed 21 percent. (water). Not more than 1 percent. of ash on incineration at a temperature not exceeding a low red heat. A solution of 5 Gm. of Glucose in 15 Cc. of distilled water, mixed with 5 drops of phenolphthalein T. S. requires not more than 0.6 Cc. of tenth-normal potassium hydroxide V. S. to produce a pink color (free acid). Dissolve about 2 Gm. of Glucose in 50 Cc. of distilled water, boil the solution for one minute and cool. The addition of one drop of tenth-normal iodine V. S. to this solution produces no blue color (starch). On now adding a few drops of starch T. S. to the solution, a blue color is produced (sulphur dioxide). Ten Cc. of an aqueous solution of Glucose (1 in 20) does not respond to the test for heavy metals. If the solution of Glucose is not colorless, comparison must be made with 10 Cc. of the same solution, to which a volume of distilled water, equal to that of the hydrogen sulphide, has been added. Dissolve 1.5 Gm. of Glucose in 5 Cc. of distilled water, add 5 Cc. of diluted sulphuric acid and 1 Cc. of bromine water and heat for 5 minutes on a water bath. Then add 0.5 Gm. of potassium iodide, follow it with 5 drops of stannous chloride T. S., cool and subject the solution to the test for Arsenic. The stain produced, if any, is not greater than that produced in a test made with the same quantities of the reagents to which 2 Cc. of the standard arsenic solution has been added.

Glyceritum Hydrastis.—No change in formula. *New Assay*: 100 Cc. yields not less than 1.12 Gm. nor more than 1.37 Gm. of the ether-soluble alkaloids of Hydrastis. Proceed as directed in the Assay of Fluidextract of Belladonna Root, modifying the process there given by using 5 Cc. of the Glycerite of Hydrastis instead of 10 Cc. of the Fluidextract of Belladonna Root. Use only ether as the immiscible solvent throughout the assay. Wash the final ether extractions with 10 Cc. of water, draw off the water and discard it. Then filter the ether solution through a pledget of purified cotton, wash the cotton with ether, evaporate the filtrate and washings and dry the residue at 100° C. to constant weight instead of titrating it. The weight will represent the amount of ether-soluble alkaloids in 5 Cc. of the Glycerite of Hydrastis.

Linimentum Saponis.—Modified directions: Add the Soap to 700 Cc. of Alcohol in which the Camphor and Oil are dissolved, then add water to make 1000 Cc., agitate the mixture until Soap dissolves and filter. 725 Cc. of alcohol was formerly used.

Magma Bismuthi.—Containing an amount of bismuth hydroxide equivalent to not less than 5.50 Gm. nor more than 6.00 Gm. of bismuth oxide in each 100 Cc. Bismuth Subnitrate 80 Gm., Nitric Acid 120 Cc., Ammonium Carbonate 10 Gm., Ammonia Water, Distilled Water, each, a sufficient quantity, to make 1000 Cc.

Mix the Bismuth Subnitrate with 60 Cc. of Distilled Water and 60 Cc. of Nitric Acid in a flask and agitate, warming gently until a solution is formed. Pour this solution with constant stirring, into 5000 Cc. of Distilled Water to which 60 Cc. of Nitric Acid has been added. Dilute 480 Cc. of Ammonia Water with 4000 Cc. of Distilled Water in a glazed or glass vessel of at least 12000 Cc. capacity. Dissolve the Ammonium Carbonate in this solution and then quickly pour the Bismuth solution into it with constant stirring. If the mixture is not distinctly alkaline, add a sufficient quantity of Ammonia Water to make it so and allow the mixture to stand until the precipitate has subsided, then pour or syphon off the supernatant liquid and wash the precipitate twice with Distilled Water, by decantation. Afterwards transfer the magma to a strainer of close texture, arranged in a percolator so as to provide continuous washing with Distilled Water, the outlet tube being elevated to prevent the surface of the magma from becoming dry, and allow the operation to proceed until the washings cease to react with phenolphthalein T. S. Then transfer the moist magma to a graduated vessel and add a sufficient quantity of Distilled Water to make the product measure 1000 Cc. and mix thoroughly. A thick, white, opaque liquid containing bismuth hydroxide in suspension in water. Neutral to litmus and phenolphthalein. One Cc. of hydrochloric acid added to 1 Cc. of Bismuth Magma produces a clear solution. Pour the clear solution into 10 volumes of distilled water; a white precipitate is produced. Evaporate 10 Cc. of Bismuth Magma to dryness and ignite the residue to constant weight; not less than 0.550 Gm. nor more than 0.60 Gm. of bismuth oxide results.

Massa Ferri Carbonatis.—Added Assay.—Weigh accurately about 1 Gm. of Mass of Ferrous Carbonate, dissolve it in 15 Cc. of diluted sulphuric acid and dilute the solution with distilled water to about 100 Cc. The immediate titration with tenth-normal potassium dichromate V. S., potassium ferricyanide T. S. being used as indicator, shows not less than 41.5 percent. of ferrous carbonate.

Massa Hydrargyri.—Added Assay.—Weigh accurately about 1 Gm. of Mass of Mercury, dissolve it in a mixture of 10 Cc. of distilled water and 5 Cc. of nitric acid and heat it on a water bath until red fumes cease to be evolved, and the liquid becomes pale yellow. Then add 150 Cc. of distilled water and 2 Cc. of ferric ammonium sulphate T. S. and titrate the solution with tenth-normal potassium sulphocyanate V. S. It shows not less than 32 percent. nor more than 34 percent. of mercury.

Nitrogenii Monoxidum.—A gas, Nitrous Oxide (N_2O). It is colorless, possesses a slight characteristic odor and a somewhat sweetish taste. It supports the combustion of many substances. For convenience in handling and use it is compressed in metal cylinders. It is quite soluble in water at low temperatures; at 25° C., 1 volume of water dissolves about 1.3 volumes of Nitrous Oxide. Pass 2000 Cc. of the gas, measured under normal atmospheric pressure at about 25° C. through 100 Cc. of barium hydroxide T. S. at a rate not exceeding 4000 Cc. per hour; not more than a slight turbidity is produced (carbon dioxide). No opalescence is produced in a mixture of 100 Cc. of distilled water and 1 Cc. of silver nitrate T. S. by 2000 Cc. of the gas under the conditions described above (halogens). No change in color is produced in 100 Cc. of distilled water to

which 5 drops of litmus T. S. have been added, by the passage of 1000 Cc. of the gas through the liquid under the conditions described above (acids or bases). No alteration in color is produced in a solution of 0.2 Cc. of tenth-normal potassium permanganate V. S. in 100 Cc. of distilled water by the passage of 1000 Cc. of the gas through the liquid under the conditions described above (reducing substances).

Oleatum Hydrargyri.—The 25 Cc. of Distilled Water is replaced by 20 Cc. of Alcohol in the new formula.

Oleoresina Petroselinii.—Exhaust Parsley Seed, in No. 60 powder, with Ether. Distil most of the Ether from the percolate, using a water bath and evaporate the remainder spontaneously, stirring frequently. Allow the Oleoresin to stand without agitation for four or five days and decant the clear liquid portion from any solid residue.

Oleum Sesami.—A fixed oil expressed from the seeds of one or more cultivated varieties of *Sesamum Indicum* Linné (Fam. Pedaliaceæ). Preserve in well-closed containers. Sesame Oil is a pale yellow, oily liquid, almost odorless, and having a bland taste. Slightly soluble in alcohol, miscible with ether, chloroform, petroleum benzin and carbon disulphide. Specific gravity: 0.916 to 0.921 at 25° C. Shake 1 Cc. of the Oil for half a minute, with a solution of 0.1 Gm. of sugar in 10 Cc. of hydrochloric acid; the acid layer will become bright red and change to dark red on standing. Blue litmus paper previously moistened with alcohol is not more than slightly reddened by 2 Cc. of the Oil (free acid). Mix 5 Cc. of the Oil in a test-tube with 5 Cc. of a mixture of equal volumes of amyl alcohol and a 1 percent. solution of sulphur in carbon disulphide and immerse the test tube to one-third of its depth in boiling saturated aqueous salt solution. No reddish color develops in 15 minutes (cottonseed oil). Saponification value not less than 188 nor more than 193. Iodine value not less than 103 nor more than 112.

Oleum Terebinthinae.—The volatile oil recently distilled from the concrete oleoresin obtained from *Pinus Palustris* Miller and from other species of *Pinus* (Fam. Pinaceæ) with water, below 100° C. Added: optical rotation variable. Solubility in alcohol changed from "3 volumes" to "5 volumes." "Very slight residue on evaporating 1 Cc." changed to "Not more than 0.05 Gm. of residue on evaporating 10 Cc. in a small dish on a water bath." Added tests: Distil 200 Cc. of the Oil at the rate of two drops per second, from a 300 Cc. globe flask, having the side tube 8 cm. above the bulb. Ninety percent. of the Oil distills between 154° and 170° C., the temperature being read with the mercury column of the thermometer immersed in the vapor. Five Cc. of the Oil added to an equal volume of hydrochloric acid in a test tube, shaken vigorously and allowed to stand for a few minutes, does not give a brownish or greenish color (resinous oils or their derivatives). Introduce 5 Cc. of Oil of Turpentine cautiously, drop by drop, into a small flask, of from 35 Cc. to 50 Cc. capacity, having a long graduated neck, and containing 25 Cc. of fuming sulphuric acid, and agitate the mixture cautiously but vigorously and frequently during five minutes, keeping the temperature just below 65° C. by immersion in cold water. Then cool, and add sulphuric acid until the bottle is filled to the upper graduation on the neck, when the clear, reddish viscous layer, which forms after the

dark mass has settled for 2 hours, should not exceed 1 percent. of the volume of Oil taken. A larger residue of colorless liquid, with a refractive index of less than 1.500 at 20° C. shows the presence of mineral oil. Caution: The addition of the Oil of Turpentine to the fuming sulphuric acid, drop by drop, is necessary because of the violence of the reaction.

Opium Deodoratum.—No change.

Opium Granulatum.—No change.

Pilulæ Ferri Carbonatis.—*Added Assay*: Dissolve three pills in 15 Cc. of diluted sulphuric acid and dilute the solution with distilled water to about 100 Cc. The immediate titration with tenth-normal potassium dichromate V. S., potassium ferricyanide T. S. being used as an indicator, shows not less than 0.065 Gm. of ferrous carbonate in each pill.

Pilulæ Ferri Iodidi.—*Added Assay*: Dissolve five pills in 15 Cc. of diluted sulphuric acid and dilute the solution with distilled water to about 100 Cc. The immediate titration with tenth-normal potassium dichromate V. S., potassium ferricyanide T. S. being used as indicator, shows not less than 0.04 Gm. of ferrous iron in each pill.

Potassii Chloras.—*Modified Test*: Ten Cc. of an aqueous solution of the salt (1 in 20) does not respond to the test for heavy metals. *Modified Assay*: Weigh accurately about 0.1 Gm. of Potassium Chlorate, transfer it to a 250 Cc. flask and dissolve it in 10 Cc. of distilled water. Then add 25 Cc. of acidulated ferrous sulphate T. S. to the solution, insert a valve stopper (see below) and boil the mixture for ten minutes. Now cool the mixture, add 10 Cc. of a 10 percent. manganous sulphate solution and titrate the excess of ferrous sulphate with tenth-normal potassium permanganate V. S. At the same time conduct a parallel experiment with another portion of 25 Cc. of acidulated ferrous sulphate T. S. to ascertain the total amount of ferrous sulphate in the solution used. *Valve Stoppers*.—Take a piece of rubber tubing of convenient diameter, and about 5 cm. in length and, having placed a piece of glass rod in one end and having slipped the other end over a glass tube which passes through a perforated stopper of a size convenient to fit the flask used, cut a longitudinal slit about 15 mm. long in one side of the rubber tube about half way up.

Resina.—Specific gravity changed from "1.070 to 1.080" to "from 1.07 to 1.09" at 25° C. Ash statement changed from "yielding no appreciable ash" to "ash not exceeding 0.05 percent." *Added description*: Its alcoholic solution shows an acid reaction.

Scopolaminæ Hydrobromidum.—Hyoscine Hydrobromide added as a synonym. *Modified description*: "The Hydrobromide of lævorotatory scopolamine, also known as hyoscine, obtained from various plants of the Solanaceæ. Colorless, transparent, rhombic crystals, sometimes of large size, odorless, slightly efflorescent. Its aqueous solution (1 in 20) is neutral or at most only slightly acid to litmus. "It melts at 151.8° C." changed to "when anhydrous it melts between 190° and 192° C." Reference to melting point of the chloraurates omitted. "Strongly lævogyrate" changed to "specific rotatory power of the salt, determined in an aqueous solution containing the equivalent of 5 Gm.

of anhydrous scopolamine hydrobromide in 100 Cc. of solution, at 25° C., is from 22° to 25.75° in a 100 mm. tube. Added tests: Two Cc. of chloroform shaken with 1 Cc. of an aqueous solution of the salt (1 in 20) to which a few drops of chlorine water have been added, will cause the chloroform to assume a brownish color. When dried to constant weight at 100° C. the loss in weight does not exceed 13 percent. It also loses its water of crystallization slowly over sulphuric acid. "No residue on incineration" changed to "On incinerating 0.1 Gm. no weighable ash remains." Added tests: A few drops of ammonia water T. S. added to 1 Cc. of an aqueous solution (1 in 20) causes no turbidity; the addition of potassium hydroxide T. S., only a whitish, transient turbidity (foreign alkaloids). Add 0.05 Cc. of tenth-normal potassium permanganate V. S. to 15 Cc. of an aqueous solution (1 in 100); the solution is not completely decolorized within 5 minutes (apoptropine). Modified test: The solution of about 0.1 Gm. of the salt in 1 Cc. of sulphuric acid, produces not more than faint yellow color (carbonizable impurities); a drop of nitric acid added to this solution, will produce an orange color, due to the liberation of bromine, but no deep-red color, fading to orange, should be noticeable (morphine). The platinic chloride test is omitted.

Sevum Præparatum.—Added tests: One Gm. of Prepared Suet dissolved in 50 Cc. of hot alcohol and a few drops of phenolphthalein T. S. added, does not require more than 0.6 Cc. of tenth-normal potassium hydroxide V. S. to produce a pink color (limit of free acid). Saponification value: not less than 193 nor more than 200. Iodine value: not less than 33 nor more than 48.

Sodii Glycerophosphas.—The sodium salt of glycerophosphoric acid containing not less than 66 percent. of anhydrous Sodium Glycerophosphate. It occurs either in the form of white, monoclinic plates or scales, as a white powder, or as a semi-solid mass having a saline taste; odorless. Very soluble in cold and hot water, nearly insoluble in alcohol. An aqueous solution (1 in 20) shows an alkaline reaction with litmus and a very slightly alkaline reaction with phenolphthalein T. S. Heated to about 60° C. the salt begins to lose water. When strongly heated it is decomposed, evolving inflammable vapors, and at a red heat is converted into sodium pyrophosphate. An aqueous solution (1 in 50), acidified with hydrochloric acid, does not respond to the test for heavy metals. Dissolve 1 Gm. of Sodium Glycerophosphate in 20 Cc. of diluted nitric acid and add an equal volume of cold ammonium molybdate T. S. No precipitate is formed within one hour (phosphates). On heating the mixture, a yellow precipitate will be formed. Triturate about 1 Gm. of Sodium Glycerophosphate, accurately weighed, with 25 Cc. of absolute alcohol, filter the mixture, evaporate the filtrate on a water-bath and dry the residue for one hour at a temperature not exceeding 70° C. The residue weighs not more than 1 percent. of the amount of salt taken (limit of alcohol-soluble impurities). Weigh accurately about 2.5 Gm. of the salt, dissolve it in 50 Cc. of distilled water and titrate with half-normal hydrochloric acid V. S., using 3 drops of methyl orange T. S. as indicator. It indicates not less than 66 percent. of anhydrous Sodium Glycerophosphate.

Syrupus.—No change.

Syrupus Acaciæ.—No change in formula. The syrup is to be heated at boil-

ing temperature for fifteen minutes, the volume restored with boiling water and the product preserved in sterilized bottles, closed with sterilized stoppers and capped.

Syrupus Acidi Citrici.—No change in formula. The syrup is directed to be made at short intervals and preserved in containers which have previously been washed with boiling water.

Syrupus Aurantii.—No change.

Syrupus Aurantii Florum.—No change.

Syrupus Calcii Lactophosphatis.—The Sugar has been reduced from 725 Gm. to 650 Gm. and 50 Cc. of Glycerin has been added.

Syrupus Hypophosphitum.—The Sugar has been reduced from 650 Gm. to 600 Gm., 50 Cc. of Glycerin added and the Tincture of Fresh Lemon Peel omitted. The alternative percolation method has been omitted.

Syrupus Ipecacuanhæ.—No change.

Syrupus Lactucarii.—No change.

Syrupus Picis Liquidæ.—The preliminary washing of the tar is omitted. An alternative percolation method is added.

Syrupus Pruni Virginianæ.—The Sugar has been increased from 700 Gm. to 800 Gm. and the Glycerin reduced from 150 Cc. to 50 Cc. The drug is moistened with water containing the Glycerin, allowed to macerate 24 hours, before starting percolation and 500 Cc. of percolate then collected. The Sugar is dissolved in the latter by agitation and Water added to make 1000 Cc. Formerly the aqueous percolate dropped into the Glycerin in the receiving bottle and did not percolate through the drug.

Syrupus Rhei.—No change.

Syrupus Rhei Aromaticus.—No change.

Syrupus Sarsaparillæ Compositus.—The Oils are mixed with Alcohol to make 20 Cc., then alcoholic solution added to the fluidextracts and this mixture added gradually to enough Syrup to make 1000 Cc. Formerly 650 Gm. of Sugar was used and water to make 1000 Cc. No alcohol was added.

Syrupus Scillæ.—No change.

Syrupus Scillæ Compositus.—The Antimony and Potassium Tartrate is dissolved in 10 Cc. of hot water and this solution added to 750 Cc. of Syrup to which is then gradually added the mixed Fluidextracts, and finally enough Syrup to make 1000 Cc. Formerly the alcohol was evaporated from the mixed Fluidextracts, 300 Cc. of water added and the mixture filtered through talc, the filter being washed with Water to make 400 Cc. of total filtrate. The Antimony and Potassium Tartrate, dissolved in 25 Cc. of hot Water, was then added and 750 Gm. of Sugar dissolved in the liquid, water being added to make 1000 Cc.

Syrupus Senegæ.—No change.

Syrupus Sennæ.—No change.

Syrupus Tolutanus.—No change.

Syrupus Zingiberis.—No change.

Tinctura Cantharidis.—The drug is to be macerated with the Alcohol in a container fitted with a reflux condenser (upright glass tube) at a temperature

of from 50° to 55° C., during 24 hours, with frequent agitation. The mixture is then transferred to a percolator and 1000 Cc. of percolate obtained. Formerly the drug was percolated with Alcohol in the usual way after 6 hours maceration, no heat being used.

Terra Silicea Purificata.—(Purified Kieselguhr). A form of Silica consisting of the frustules and fragments of diatoms, purified by boiling with diluted hydrochloric acid, washing and calcining. It does not contain more than 10 percent. of hygroscopic moisture. Preserve it in tightly closed containers. Purified Siliceous Earth is a very bulky and very fine powder, white or of a pale light gray or pale buff color, without odor or taste. It readily absorbs moisture and will retain about four times its weight of water without the mixture becoming fluid. It is insoluble in water, acids or dilute alkaline solutions. Boil 10 Gm. of Purified Siliceous Earth with 50 Cc. of distilled water and filter the mixture; the filtrate is colorless and neutral to litmus. When ignited it does not darken nor lose more than 10 percent. of its weight (excessive moisture). The dried powder does not darken or lose appreciably in weight on ignition (organic impurities). Add 1 Gm. of Purified Siliceous Earth to 25 Cc. of hydrochloric acid; no effervescence should occur (carbonates) and after boiling and filtering, the filtrate is colorless, and separate portions, when tested, yield no precipitate with barium chloride T. S. (sulphates) and no blue color with potassium ferrocyanide T. S. (iron). Treat 1 Gm. of Purified Siliceous Earth with 20 Cc. of diluted hydrochloric acid and filter. Ten Cc. of the filtrate, when evaporated to dryness and the residue ignited, should not leave a residue weighing more than 0.005 Gm.

Tinctura Cinchonæ.—Menstruum II changed from Alcohol 65 parts and Water 25 parts to Alcohol 75 parts and Water 25 parts.

Tinctura Cinchonæ Composita.—Red Cinchona powder and Bitter Orange Peel powder changed from No. 60 to 40. Menstruum II changed from Alcohol 65 parts and Water 25 parts to Alcohol 75 parts and Water 25 parts.

Tinctura Digitalis.—Menstruum changed from diluted Alcohol to Alcohol 3 volumes and Water 1 volume.

Tinctura Iodi.—The 50 Gm. of Potassium Iodide is dissolved in 50 Cc. of distilled water in a bottle, 70 Gm. of Iodine is then dissolved in this solution by agitation and enough Alcohol added to make 1000 Cc. No water was used in the former process.

Tinctura Sanguinariæ.—Ten Cc. of Hydrochloric Acid replaces the 20 Cc. of Acetic Acid, otherwise the process remains the same.

Trioxymethylene.—It contains not less than 96 percent. of trioxymethylene or paraformaldehyde; $(\text{HCOH})_3 = 90.05$, a polymeric form of formaldehyde. It occurs in white, friable masses, or as a powder, having a slight odor of formaldehyde. On heating it is partly converted into formaldehyde and partly sublimed unchanged. Slowly soluble in cold water, more readily soluble in hot water with the formation of formaldehyde, insoluble in alcohol or ether; soluble in fixed alkali solutions. A mixture of about 0.01 Gm. each of Trioxymethylene and morphine sulphate and 10 drops of sulphuric acid assumes a violet-red color, changing to blue. On incinerating 2 Gm. of Trioxymethylene, not more than 0.1

percent. of ash remains. Shake about 0.5 Gm. of Trioxymethylene, finely powdered, with 10 Cc. of distilled water; the latter should remain neutral to litmus. Assay: Weigh accurately about 1 Gm. of Trioxymethylene, finely powdered, mix it with 50 Cc. of normal potassium hydroxide V. S. in a 250 Cc. flask and add immediately, but slowly, through a small funnel, 50 Cc. of solution of hydrogen dioxide which has been previously rendered neutral to litmus with sodium hydroxide. When the reaction has ceased and the foam subsided, rinse the funnel and the sides of the flask with distilled water, allow the liquid to stand for half an hour and then determine the excess of alkali with normal sulphuric acid V. S., using litmus T. S. as indicator.

Trochisci Acidi Tannici.—No change.

Trochisci Ammonii Chloridi.—No change.

Trochisci Cubeæ.—No change.

Trochisci Potassii Chloratis.—No change.

Trochisci Sodii Bicarbonatis.—No change.

Unguentum.—Five percent. or more of the Benzoinated Lard may be replaced by White Wax in southern latitudes and during the heated season in other localities.

Unguentum Acidi Borici.—The Paraffin is reduced to 50 Gm. and the White Petrolatum correspondingly increased. 100 Gm. of Paraffin was formerly directed.

Unguentum Acidi Tannici.—No change.

Unguentum Aquæ Rosæ.—The clause is omitted directing the omission of the Sodium Borate when the ointment is used with metallic salts, otherwise no change.

Unguentum Belladonnæ.—The Hydrous Wool-Fat is increased from 20 Gm. to 30 Gm., 10 Gm. less of Benzoinated Lard being taken. No other change.

Unguentum Chrysarobini.—No change.

Unguentum Diachylon.—White Petrolatum replaces Olive Oil in the Ointment.

Unguentum Gallæ.—No change.

Unguentum Hydrargyri.—No change.

Unguentum Hydrargyri Ammoniati.—No change.

Unguentum Hydrargyri Dilutum.—The mercury has been reduced from 33.5 percent. to 30 percent.

Unguentum Hydrargyri Nitratæ.—Modified process: Mercury 7.0 Gm., Nitric Acid 17.5 Gm., Lard, free from Water, 76.0 Gm. To make about 100 Gm. Warm the Lard in a capacious porcelain dish until it has just melted (about 45° C.); add 7 Gm. of the Nitric Acid all at once and continue the heat until the characteristic reaction is complete. Hold an inverted glass funnel over the dish to protect the operator from any Lard spurting from the dish during the reaction. Withdraw the heat immediately after the rapid rise of froth which accompanies the end reaction and cool the treated Lard, stirring it until it assumes a bright citrine color. Dissolve the Mercury in the remainder of the Nitric Acid, warming it if necessary, to prevent crystallizing and mix the solution with the previously prepared Lard. The quantity prepared has been changed from 1000 Gm. to 100 Gm. Formerly 70 Gm. of Nitric Acid was added to 760 Gm. of melted Lard at 105° C. and, when the reaction moderated, the heat was reapplied until effervescence

ceased. The mercuric nitrate solution was then stirred into the cooled, prepared Lard as above.

Unguentum Hydrargyri Oxidi Flavi.—No change.

Unguentum Iodi.—No change.

Unguentum Iodoformi.—Benzoinated Lard replaces the Lard; otherwise no change.

Unguentum Phenolis.—2.25 Gm. of Liquefied Phenol replaces 3 Gm. of Phenol and Ointment replaces White Petrolatum as the vehicle.

Unguentum Picis Liquidæ.—No change.

Unguentum Stramonii.—No change.

Unguentum Sulphuris.—Sublimed Sulphur replaces Washed Sulphur; otherwise no change.

Unguentum Zinci Oxidi.—No change.

ARSENIC TEST.

Standard Arsenic Test Solution.—Dissolve 0.1 Gm. of pure arsenic trioxide which has been finely pulverized, dried in a desiccator and accurately weighed, in about 5 Cc. of a 20 percent. solution of sodium hydroxide (free from arsenic). Neutralize the solution with diluted sulphuric acid, and then dilute it in a graduated flask to exactly 1000 Cc., using recently boiled distilled water at 25° C., to which 10 Cc. of diluted sulphuric acid has been added. Accurately measure 10 Cc. of this solution, transfer it to a 1000 Cc. flask and again dilute it to 1000 Cc. with recently boiled distilled water at 25° C., to which 10 Cc. of diluted sulphuric acid has been added. Employ this solution, containing 0.001 milligrammes of arsenic trioxide in each 1 Cc. in preparing the standard stain. This solution should be kept in a glass-stoppered bottle. It is advisable to prepare fresh solutions whenever new standard stains are to be prepared.

Preparation of the Chemical to be Tested.—Add 1 Cc. of a mixture of equal volumes of concentrated sulphuric acid, and distilled water to 5 Cc. of an aqueous solution of the chemical (1 in 25) or to a solution in 5 Cc. of distilled water of the residue remaining after special treatment. Acidulation as just directed is not necessary in the case of inorganic acids. Then add 10 Cc. of a saturated aqueous solution of sulphurous acid. Heat this liquid in a small beaker, on a water-bath, until it is free from sulphurous acid and has been reduced to about 2 Cc. in volume. Dilute this evaporated liquid to about 5 Cc. with distilled water.

Test-Apparatus.—Prepare several generators, equipped with tubes, etc., as described below. Select as a generator a bottle of about 50 Cc. capacity, having a mouth about 2.5 cm. in diameter and provide a well-fitting rubber stopper, suitably perforated. In one of the perforations in this stopper insert a thistle tube about 5 mm. in diameter and 15 cm. long, slightly bent where it emerges from the stopper and constricted at its lower extremity to an opening about 1 mm. in diameter, reaching within about 2 mm. of the bottom of the bottle. Insert through another perforation of the stopper a vertical exit tube about 13 cm. in total length and 1 cm. in diameter throughout the upper portion (about 10 cm.) and constricted at its lower extremity to a tube of about 3 cm. in length and about 5 mm. in diameter. This latter tube should extend but slightly below the stopper. In

the lower part of this exit-tube is to be inserted a small pledget of dry glass wool and then a strip of the freshly-prepared but dry lead acetate test paper rolled into a coil, and above this a plug of the moist (not wet) lead acetate glass wool. In the upper extremity of this tube insert through a perforated cork stopper, a glass tube 12 cm. in length, having an internal diameter of about 3 mm. In this is to be placed the mercuric bromide test paper, bending or creasing the upper portion of the strip so that it will retain its position. The strip should extend within about 2 cm. of the perforated cork stopper and must not be introduced into the tube until ready to start the test. This tube should be thoroughly cleaned and dried each time it is used.

Preparation of Standard Stain.—Introduce into the generator about 8 Gm. of the zinc followed by 25 Cc. of dilute sulphuric acid (1 in 4) and 5 drops of the acid stannous chloride T. S. Insert the stopper containing the thistle tube and the exit tubes into which have been placed the glass wool pledget, the dry lead acetate test paper, the moist lead acetate glass wool, and the mercuric bromide test paper as described under the Test Apparatus. Add at once through the thistle tube 2 Cc. (accurately measured) of the standard arsenic T. S. and wash this down into the apparatus with 5 Cc. of the dilute sulphuric acid (1 in 4). Should the evolution of the gas be violent at first, check the reaction by immersing the bottle in cold water. Should the reaction subside, increase it by placing the bottle in warm water. If the reaction be too violent, the stain will spread and not form a distinctive band, thus making the color intensity comparisons difficult. After the test has continued for forty-five minutes, remove the mercuric bromide test paper and place it in a clean, dry tube for comparison. This stain represents 0.002 milligrammes of arsenic trioxide in addition to any stain produced by the reagents. The stain from the reagents should scarcely be perceptible when determined by a blank experiment. For preservation the standard test strips are to be dipped into hot melted paraffin.

Testing the Chemical.—Introduce into another generator about 8 Gm. of the zinc, followed by 25 Cc. of the dilute sulphuric acid (1 to 4) and 5 drops of acid stannous chloride T. S. Insert the stopper containing the thistle tube and the exit tube charged with the test papers and glass wool, as just described. Then add at once through the thistle tube 5 Cc. of the solution to be tested, previously reduced as directed, under *Preparation of the Chemical*, and wash this down into the apparatus with 5 Cc. of the dilute sulphuric acid (1 in 4). When the evolution of hydrogen has proceeded actively for forty-five minutes, remove the mercuric bromide test paper and carefully compare it with the standard stain prepared as described above. The stain produced by the chemicals tested should not exceed in length or intensity of color that prepared as a standard, indicating not more than 1 part of arsenic in 100,000 parts of the substance tested.

Antimony, if present in the substance tested, will produce a gray stain. Sulphites, sulphides, thiosulphates, and other compounds which liberate hydrogen sulphide or sulphurous acid, when treated with sulphuric acid, must be oxidized by means of nitric acid and then reduced by means of sulphurous acid as directed under *Preparation of the Chemical*, before introducing into the apparatus. Sulphur compounds as well as hydrogen phosphide give a bright yellow band on

test-paper. If sulphur compounds are present, a simultaneous darkening of the lead acetate test paper and glass wool will occur. If such be the case, the operation as directed under *Preparation of the Chemical* must be repeated upon a fresh portion of the sample, using greater care in effecting the complete removal of the sulphurous acid. In testing hypophosphites special care should be observed to completely oxidize the sample as directed, otherwise a yellow stain, which might be confused with the orange yellow color produced by arsenic, may be produced through the evolution of hydrogen phosphide. Compounds containing antimony should be tested for arsenic by Bettendorf's Test. The test apparatus should be thoroughly cleaned and dried immediately after use.

REAGENTS.

Arsenic Trioxide, Pure (Arsenous Oxide).— As_2O_3 . Arsenic trioxide for use in the Arsenic Test should comply with the description and tests given under Arseni Trioxidum, and also the following additional tests: One Gm. of the trioxide, when heated in a porcelain crucible under a hood until vapors are no longer evolved, should yield not more than 0.2 mgm. residue (non-volatile matter). Reduce the arsenic trioxide to a fine powder and thoroughly dry it in a desiccator; it should show 100 percent. of arsenic trioxide when assayed as directed under Arseni Trioxidum.

Filter Paper, Quantitative.—For use in the Arsenic Test use Schleicher and Schull's No. 589 (Blue Ribbon) or Swedish O, filter paper, or other make of like surface or quality, for the Mercuric Bromide Test Paper.

Glass Wool.—(Spun Glass.)—Fine threads of spun glass. Two Gm. of glass wool when digested on a bath of boiling water for one-half hour with 100 Cc. of diluted hydrochloric acid, the mixture filtered and the filtrate evaporated to dryness and then dried at 110°C ., should leave not more than 0.01 Gm. of residue (soluble matter). Boil 1 Gm. of glass wool for a few minutes with a mixture of 25 Cc. each of diluted nitric acid and distilled water; filter, evaporate the filtrate to dryness and treat the residue with 10 Cc. of distilled water and again filter it; the filtrate should not be affected by the addition of hydrogen sulphide T. S. (lead).

Lead Acetate (Glass Wool).—Immerse Glass Wool in a mixture of equal parts of lead acetate T. S. and distilled water and remove the excess of liquid by pressing it between filter-paper. The glass wool should be prepared as just described immediately before it is required in the test.

Lead Acetate Test-Paper.—Immerse strips of heavy white filter-paper 5 cm. wide and 8 cm. long in a mixture of equal parts of lead acetate T. S. and distilled water, drain off the excess of liquid and dry the strips on glass in an oven at 100°C .

Lead Acetate Test Solution.—Dissolve 10 Gm. of clear, transparent crystals of lead acetate, $\text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2 + 3\text{H}_2\text{O}$ (Plumbi Acetas, U. S. P.) free from adhering lead carbonate, in sufficient water to measure 100 Cc. Preserve the solution in well-stoppered bottles.

Mercuric Bromide.— HgBr_2 . It occurs in white rhombic needles or prisms or

lustrous scales or as a granular, crystalline powder fusing at about 325° C. and subliming without decomposition. Soluble in 200 parts of water at 25° C. and 5 parts of boiling water; readily soluble in boiling alcohol.

Mercuric Bromide Test Paper.—Cut stiff, heavy quantitative filter-paper into strips 3 cm. in width and 12 cm. in length. Immerse these strips for five minutes in alcoholic mercuric bromide T. S. Remove the excess of solution by pressing the strips between filter-paper and then dry them quickly on glass in an oven heated to 100° C. Place the strips at once in a wide-mouthed bottle and stopper it securely.

Mercuric Bromide Test Solution, Alcoholic.—Dissolve 5 Gm. of Mercuric Bromide in 100 Cc. of alcohol, employing a gentle heat to facilitate solution. Keep it in glass-stoppered bottles protected from the light.

Stannous Chloride, $\text{SnCl}_2 + 2\text{H}_2\text{O}$. Colorless crystals readily soluble in water and alcohol. When in contact with air or excess of water, the salt readily forms a basic chloride, hence when dissolved, its solutions should be acidulated with hydrochloric acid. The presence of arsenic above the U. S. P. limits should be determined. Boil two grammes of the salt with 10 Cc. of hydrochloric acid for several minutes; the solution should remain clear and colorless for one hour. When tested for arsenic as directed under the blank test for arsenic, 0.3 Gm. of stannous chloride should not produce a stain. *Alternative process:* Heat tin with concentrated hydrochloric acid, taking care that the metal is in excess. When the acid has become saturated, pour off the clear fluid from the undissolved excess of tin, filter it through asbestos and set it aside until crystallization takes place. Break up the crystals, drain, and dissolve them at once as directed under the Test Solutions or in Bettendorf's Arsenic Test. When thus prepared, stannous chloride must respond to the tests for arsenic given above. 0.3 Gm. of stannous chloride should not produce a stain. When freshly prepared the salt should be completely soluble in one part of alcohol (foreign salts).

Stannous Chloride Test Solution, Acid.—Dissolve 40 Gm. of stannous chloride crystals in 60 Cc. of concentrated hydrochloric acid and preserve it in a glass-stoppered bottle.

Sulphuric Acid, Concentrated for Tests, H_2SO_4 . When concentrated sulphuric acid is especially directed in a test, it is intended that the strongest pure acid of a specific gravity of not less than 1.834 at 25° C. be employed. In addition to the tests prescribed for this acid in the text of the Pharmacopœia, it is required to conform to the following more rigorous tests before it can be employed as a reagent. Dilute 1 part of the acid with 4 parts of distilled water; the stain from 25 Cc. of this dilute acid should scarcely be perceptible when subjected to the Arsenic Test. Pour 1 Cc. of diphenylamine T. S. carefully so as to form a separate layer upon 5 Cc. of the concentrated sulphuric acid contained in a test-tube; no distinct blue color should appear at the zone of contact (nitric acid). Upon carefully pouring about 2 Cc. of hydrochloric acid, in which a particle of sodium

sulphite has been dissolved, over about 2 Cc. of the concentrated sulphuric acid, no reddish zone should appear and no precipitate should form (selenium).

Tin, Sn.—Pure metallic tin in the granulated or mossy condition. Digest 5 Gm. of tin with 40 Cc. or a sufficient quantity of nitric acid (Acidum Nitricum, U. S. P.), on a bath of boiling water until entirely converted into a white powder, then evaporate it completely to dryness. Stir the residue with 25 Cc. of diluted nitric acid and 25 Cc. of distilled water and filter it. To the filtrate add 1 Cc. of diluted sulphuric acid (Acidum Sulphuricum Dilutum, U. S. P.), evaporate it as far as possible upon a water-bath, and to this add 10 Cc. of distilled water; no weighable residue should remain undissolved (lead). When converted into stannous chloride it should comply with the tests directed under that salt.

Zinc for Arsenic Test.—The Zinc should preferably be in globular form, about 3 to 6 mm. in diameter, known as No. 7 Shot Zinc. It should be free from sulphur and phosphorus. The stain from 8 Gm. of Zinc should scarcely be perceptible when determined by a blank experiment.

Heavy Metals Test.—This test is to be used to detect the presence of undesirable metallic impurities in official chemical substances or their solutions; these should not respond affirmatively within the stated time. Acidulate 10 Cc. of a solution of the substance in distilled water (1 in 50) contained in a test-tube of about 40 Cc. capacity with 1 Cc. of diluted hydrochloric acid (unless otherwise directed), warm it to about 50° C., add an equal volume of freshly prepared hydrogen sulphide T. S., and allow the mixture to stand in a well-stoppered test-tube, in a warm place, at 35° C. for half an hour. At the end of this time the mixture should still possess the odor of hydrogen sulphide; if not, it should be thoroughly saturated with the gas and again set aside for half an hour. Any change in the color of the solution which is being tested should be noted by comparison with the same volume of the hydrogen sulphide T. S. (which has been likewise acidulated), when viewed crosswise by reflected light while held against a white surface.

GREAT PURCHASE OF SUGAR.

The Western Mail states that in consequence of the cessation of the British supply of beet sugar from Germany, Austria, and Belgium, Mr. McKenna, Home Secretary of the British Government, has purchased 900,000 tons of raw sugar at about £20 (\$97.33) per ton, the transaction involving an outlay of about £18,000,000 (\$87,597,000). The sugar has been purchased in Demerara, Java, Mauritius, and other places. This is by far the largest purchase of sugar which has ever been made. The sugar is to be sold virtually at cost price to the refiners, who by arrangement with the Government have agreed to sell the commodity when refined to the dealer at a fixed price based upon the cost of the article, plus a fair manufacturing profit.

AMYL NITRITE; ITS PREPARATION, PURITY AND TESTS.

FRANK O. TAYLOR, PH. C.

(Continued from September Number.)

(3) For the third experiment a sample made from alcohol No. 1, which had not been saturated with the nitrous gas, was used. Before fractionation it assayed 65 percent. 100 cc. were then distilled and each of the parts tested separately for the content of amyl nitrite.

Below 80°	2%	99°-100°	6%

Assay of fraction 90°-100°..... 97.7 percent

Assay of fraction above 100°..... 68.5 percent

(6) The preceding experiments having revealed the difficulty of *completely* converting amyl alcohol to the nitrite in spite of the fact that almost all of it may be easily changed, further experiments were made to determine how far this conversion could be carried by this process. To this end 150 cc. of alcohol No. 1 was partially saturated with nitrous acid and then, continuing the stream of gas, it was heated gently until distillation began. The thermometer was kept in the liquid to guard against any unnecessary heating. A mixture of amyl nitrite and water with perhaps a little amyl alcohol distilled quite constantly at 85°-86° (temperature of liquid) until about 150 cc. of distillate was obtained and bumping began in the flask. The stream of gas was now stopped, the thermometer raised to its usual place in the vapor and distillation continued to 100°. At this point the distillation was stopped and a stream of nitrous gas again introduced into the liquid in the flask and continued until it passed through without absorption. After this, distillation was resumed as before. A third time this was repeated in the residual liquid, then the mixed distillates were washed with water, twice with sodium carbonate solution, and again several times with water, then dried over calcium chloride. This crude product amounted to 133 cc., had an acidity of 0.7 cc. and assayed 91.6 percent.

Distillation:—

Beginning at 93°		98°- 99°18.4%
Below 94°1.6%	99°-100°8.0%
95°-96°8.8%	100°-101°2.4%

Anything better than this cannot be desired for therapeutic use.

Production of Pyridine Nitrite in Manufacture of Amyl Nitrite.

When the residue left in the flask after the third distillation in experiment No.

6 for the production of amyl nitrite was allowed to cool, long, silky crystals formed on the sides of the flask. Noticing this peculiar fact the residue was poured into a glass evaporating dish and set on ice. No crystals formed at once but after some hours a considerable crop of matted needle-shaped yellow crystals was formed. They were readily soluble in the mother liquor on warming; so much so that pressure between filter papers would not remove excess of mother liquor since the crystals would redissolve even at room temperature and be absorbed by the paper. They were finally partially purified by washing with ether on a vacuum filter.

They were extremely soluble in water, very soluble in alcohol and chloroform, somewhat soluble in amyl alcohol and amyl nitrite, slightly soluble in ether and to a less degree in petroleum ether. They had a marked odor resembling pyridine, were strongly acid to litmus and gave a marked test for nitrates. They melted at about 116° .

From their crystalline appearance, odor and tests they were suspected to be pyridine nitrate, so in order to fully identify them the lower aqueous layer, resulting from the manufacture of a much larger quantity of amyl nitrite, was separated and evaporated on a steam-bath until crystals began to form. On cooling in a desiccator a considerable quantity of crystals formed and these were carefully separated from the small quantity of mother liquor and washed with ether on a vacuum filter. The crystals so obtained were yellowish in color and were purified, by three times recrystallizing from water, freeing from mother liquor each time on a vacuum filter and washing with ether. They were now pure white needles melting at 117° - 118° , not hygroscopic and soluble exactly as the previously obtained impure crystals and were identical with the crystals of pyridine nitrate prepared from pure pyridine.

The presence of pyridine nitrate in amyl nitrite, or its production in amyl-nitrite manufacture, seems not to have been mentioned before, tho it is possible that the crystals of ammonium nitrate mentioned by Maisch (*Am. Jour. Pharm.*, 1871, 146) were in reality pyridine nitrate.

Cause of Production.

One of the reactions producing pyridine is the heating together of iso-amyl nitrite and phosphorus pentoxide. It is reasonable to suppose that the hot vapors of nitrous acid together with a small quantity of nitric acid carried over at the same time will react with amyl alcohol to form pyridine nitrate. The fact that pyridine has been found in impure amyl alcohol may have some significance in this connection tho from experiments made there was no evidence of pyridine being present in the alcohol used.

To prove that the action of nitric acid on amyl alcohol produces pyridine nitrate, nitric acid was boiled in one flask and the vapor passed through 150 cc. of amyl alcohol contained in a second flask, for several hours; the alcohol used being the same as that used for the production of most of the amyl nitrite. The aqueous layer was separated, the alcohol washed with water and the washings, together with the solution first separated, evaporated on the steam-bath. Crystals were obtained which on purification proved to be pyridine nitrate.

A second lot of 150 cc. of the same amyl alcohol was shaken with 5 cc. of concentrated nitric acid and after standing for a short time the alcohol was washed well with water and the washings evaporated as before. Here also pyridine nitrate was produced.

A sample of Kahlbaum's amyl alcohol distilling completely between 130° and 132° , when shaken with nitric acid in the same manner and subsequently washed, yielded a small amount of pyridine nitrate crystals. The quantity of these was, however, much less than with the preceding sample.

We have these three hypotheses to account for the production of pyridine nitrate. (1) The presence of pyridine in the amyl alcohol; (2) the production from some impurity in the amyl alcohol either directly or by catalytic action; (3) the production direct from amyl alcohol. The first of these can scarcely be considered in view of the above experiments on amyl alcohol distilling so perfectly at the theoretical boiling point. Of the next two the second seems preferable.

Further investigation on this point was prevented by lack of time but would be of interest.

By reason of its extreme solubility in water and low solubility in amyl nitrite, pyridine nitrite can be completely removed from amyl nitrite by thorough washing with successive small quantities of water. Amyl nitrite may be tested for pyridine nitrate or water-soluble nitrates in the following manner:

Thoroughly agitate 10 cc. of amyl nitrite with 5 cc. of water in a separatory funnel, run off 2.5 cc. of the water into a test-tube, add 5 cc. of 10 percent. sulphuric acid and sufficient urea to effect the destruction of all nitrites. This point may be ascertained by removing a portion of the solution and adding iodo-starch paste. If no blue color be produced add to the rest of the fluid a few drops of iodo-starch paste and a piece of pure zinc. If nitrates are present the solution will soon become blue.

By this test amyl nitrite which has not been washed well was shown to contain soluble nitrates, supposedly entirely pyridine nitrate, while after thorough washing no trace of nitrates was made apparent by this test. Hence an amyl nitrite which shows this nitrate reaction has not received careful washing and, in view of the noxious character of pyridine compounds, should be classed with the undesirable samples.

CHARACTER OF NITRITE FROM DIFFERENT FRACTIONS OF SAME ALCOHOL.

If the alcohol used distils over a range of three or four degrees what difference, if any, would there be in nitrite made from different fractions?

To throw some light on this a liter of alcohol No. 1 was distilled and the first 100 cc. of distillate, and last 100 cc. remaining in the flask, was converted to nitrite.

(7) The same method was used as for (6) excepting the repetition of the nitrating after the first distillation. From the 100 cc. of alcohol in each case, 100 cc. yield was obtained after washing and drying with A (the first fraction) and 94 cc. with B (the last fraction).

Assay:—A		93.9 percent
B		91.5 percent
Distillation:—	A	B
Below 92°	2%
92°-94°	9%
94°-96°	28%	1%
96°-97°	16%	18%
97°-98°	14%	37%
98°-99°	9%	11%
99°-100°	6%	11%
100°-101°	5%
101°-105°	7%
Above 100°	14%	20%
Above 105°	8%
90°-100°	84%	78%
94°-99	67%	67%

Both products are excellent in assay and distillation, and, tho some agreement is shown in quantity of distillates at 90°-100° and exact agreement at 94°-99°, yet the greater amount of distillate from A is about two degrees lower than that from B.

(8) This experiment was carried out by keeping the amyl alcohol cold with an ice-water bath and saturating with nitrous acid slowly and as completely as possible, then washing, drying and distilling, collecting the portion between 90° and 100°. Of the washed and dried nitrite 83.3 percent distilled at the required temperature. This was now assayed and fractionated.

Assay.—99.7 percent.

Distillation:—

94°-96°	9%	98°-99°	9%
96°-97°	38%	99°-100°	5%
97°-98°	32%	Residue	6%

70 percent within one degree of the theoretical boiling point.

In order to compare the amyl nitrite obtainable from this alcohol and from a very pure sample both by the nitrous-acid process and the sodium nitrite-sulphuric acid process, a number of experiments were made.

(9) Kahlbaum's amyl alcohol was treated with nitrous acid as in the preceding, no arrangement for cooling being made, and continuing the current of gas until it passed unabsorbed. It was then permitted to stand until the brown color disappeared and after that again treated with nitrous gas. Finally, let stand for some hours before preliminary purification.

Assay.—74.4 percent.

Distillation.—(In brief.)

Beginning about 96°	105°-110°	18.0%
Below 100°	110°-120°	12.0%
100°-105°	120°-130°	6.0%
.....

Continuing rapidly to 140° and a residue remaining undistilled at 155°.

(10) As for (9), shortening the length of treatment with nitrous acid, this being continued only until the amyl nitrite began to turn brown.

Assay.—77.6 percent.

Distillation:—

Beginning about 93°	102°-105°	9.9%
93°-98°	105°-110°	7.4%
98°-99°	110°-145°	9.7%
99°-100°	Residue	5.4%
100°-102°

(11) Process carried out as in the preceding shortening the length of the time during which the stream of nitrous gas was passed into the alcohol.

Assay.—57.7 percent.

Distillation:—

Below 90°	5.3%	105°-110°	10.7%
90°-100°	21.0%	110°-130°	14.0%
100°-105°	32.0%	Residue above 130°	15.0%

The part boiling below 90° is due to imperfect drying and consequent presence of water.

(12) The amyl alcohol was heated gently with a micro-burner so that a portion of the amyl nitrite formed distilled over. Again the result was poor.

Assay.—70.4%.

Distillation:—

Below 94°	0.7%	102°-105°	13.3%
94°-98°	9.3%	105°-120°	11.3%
98°-100°	20.0%	120°-135°	5.4%
100°-101°	12.7%	Residue	16.7%
101°-102°	8.7%		

(13) Finding that under none of these conditions did this alcohol yield good results, in number 13 the alcohol was kept cool with ice-water and the nitrous gas passed slowly.

Assay:—

Distillation:—

Below 95°	1.2%	99°-100°	8.1%
95°-96°	1.3%	100°-105°	8.7%
96°-97°	5.6%	105°-110°	1.9%
97°-98°	51.9%	Residue	3.1%
98°-99°	16.3%		
	90°-100°	84.4%	
	94°-99°	76.3%	

This is an excellent result, better than any so far obtained without rectifications; but the necessity for cooling is very apparent. The result is, however, not so far superior to the best obtained from the less pure alcohol as might have been expected.

(14) The nitrous-acid process has been shown to yield excellent results when carefully carried out, both as regards good product and high yield. It would be interesting to know whether the sodium nitrite-sulphuric acid method yields sufficiently better results to justify its use on a manufacturing scale.

Alcohol No. 1 was used and the process carried out as given by Dunstan and Wooley for iso-butyl nitrite (*Pharm. Jour.* (3) 19, 487). Sixty-eight grammes of 95 percent sulphuric acid was mixed gradually with 152 cc. amyl alcohol, keeping the mixture cold. This was now run very slowly beneath the surface of a solution of 100 grammes sodium nitrite in 300 cc. of water, cooling with a bath of ice-water. After the reaction was ended the amyl nitrite was washed and dried as in the other process.

The product was very dark in color, being reddish-brown, and this was unchanged by washing. Bad as was its appearance, it tested surprisingly well.

Acidity—0.4 cc. *Aldehyde*—None. *Assay*—90.9 percent.

Distillation:—

Below 92°	0.7%	98°- 99°	7.1%
92°-94°	3.6%	99°-100°	3.6%
94°-96°	11.4%	100°-105°	4.3%
96°-97°	42.8%	Residue	6.0%
97°-98°	19.3%		
		90°-100°	88.5%
		94°- 99°	80.6%

This is not equal to the assay of (13) but is superior to it in distillation, in which respect it is also superior to any of the preceding experimental samples.

(15) It remained to make a similar experiment on the purest alcohol. Kahlbaum's alcohol treated in like manner as above yielded, from 150 cc., 135 cc. of a brownish yellow amyl nitrite.

Assay.—94.8 percent.

Distillation:—

95°-96°	4%	98°- 99°	5%
96°-97°	68%	99°-100°	5%
97°-98°	12%	Residue	5%
		95°-100°	94%
		96°- 98°	80%

Of the whole product, 60 percent distilled between 96.5° and 97°. This is approaching very closely to a pure amyl nitrite, and is obtained, it must be remembered, without any rectification.

At a later date a quantity of amyl nitrite was made on a manufacturing scale, using the arsenic-sulphuric acid process, which gave exceptionally good results. Amyl alcohol No. 1 was used, nitrous gas was slowly passed through it, keeping the alcohol cooled to about room temperature, until the solution was brown. It was then allowed to stand in the sunlight till it changed to a light green color and was then washed thoroughly with 5 percent sodium carbonate solution and dried over soda ash.

Assay.—98.6%.

Distillation:—

Below 95°	4%	97°- 98°	10%
95°-96°	16%	98°-100°	6%
96°-97°	60%	Residue	4%

Here is 86 percent distilling within a range of 3° and 96 percent between 90° and 100°.

High Boiling Substances Produced with Amyl Nitrite:—From the temperature reached in the distillation of many of the lots made by the nitrous-acid process, it appeared that some body was produced, having a boiling point higher than amyl alcohol, so for the purpose of obtaining any information that might present itself the fractions boiling below 90° and above 100° from several of the preceding experiments were united and treated again with nitrous gas, washed, dried, assayed and distilled.

Assay.—64.4 percent.

Distillation:—

Below 96°	2.3%	102°-105°	6.2%
96°- 98°	10.8%	105°-140°	10.0%
98°- 99°	8.5%	140°-150°	2.3%
99°-100°	11.5%	150°-160°	4.2%
100°-101°	14.6%	160°-175°	4.6%
101°-102°	13.9%	Residue above 175°	9.2%

Thirty-three percent distilled below 100°, but the most for any one degree was between 100° and 101°. After reaching 105° the amyl nitrite had evidently almost all distilled, for the temperature rose rapidly to 140° and over 9 percent remained undistilled at 175° with the temperature still rising. This showed that some body with a very high boiling point was produced. Whether this was from the amyl alcohol or from an impurity, or what it was, no attempt was made to ascertain, as that went beyond the scope decided on for this work. It presents, however, an interesting problem for any one with the time to devote to it, as this high boiling point substance was undoubtedly present to a small extent in unrectified amyl nitrite, such as is chiefly found on the market.

Boiling Point of Amyl Nitrite and Water.—In a number of distillations of amyl nitrite it was noticed that tho the assay would be high, yet the point of beginning of the distillation would be below 80° and that there was a more or less prolonged time during which the thermometer remained nearly stationary at about 80°. In these same cases it was always noticed that a trace of water was present. This seemed good evidence that a binary mixture of amyl nitrite and water distilled at this point. To determine if the conclusion were true, 100 cc. of amyl nitrite were carefully rectified and the part distilling between 96.5° and 97.5°, amounting to 37 cc. was taken as practically pure. This was mixed with 15 cc. of water and distilled in the same manner as other amyl nitrites.

Distillation:—

79°-80°	12 cc. = 23.0%
80°-81°	21 cc. = 40.4%
81°-85°	4 cc. = 8.8%

Between 79° and 81° 63.4 percent of the mixture distilled over and the ratio of water to amyl nitrite was 1:11, by volume, so that nearly 82 percent of the original amyl nitrite distilled between 79° and 81°. The ratio between the water and nitrite for the portion distilling between 81° and 85° was 1:9, which goes to show that as the ratio between water and nitrite changes in the distilling flask there is also a change in the ratio for the distillate. This comparatively low boiling point of the binary mixture constitutes a more delicate test for water in amyl nitrite than the freezing test, for it has been repeatedly found possible to detect traces of moisture in samples which were passed as perfectly dry by the freezing test. Even in the presence of but minute traces of water, the first few drops of distillate will be near 80° and then the temperature will run quickly above 90°. Even before distillation begins, the binary mixture will vaporize into the neck of the distilling flask and there condensing show drops of water on the glass, which are not to be mistaken for condensed amyl nitrite. In view of the proneness to decomposition of amyl nitrite in presence of moisture, this test becomes of value as certifying to a freedom from moisture not shown by freezing.

Much more accurate data regarding a binary mixture of water and amyl nitrite would be of interest, such as might be obtained by a delicate fractional distillation apparatus like Young's evaporator still-head. Also, the investigation of a probable ternary mixture of water, amyl alcohol and amyl nitrite is to be recommended.

Summary.—In conclusion we would call attention to these various facts:

1. That the character of amyl nitrite on the market to-day is, as a whole, mediocre, with a little very good and other small part very bad.
2. That with proper care first-class amyl nitrite may be made commercially.
3. That the nitrous acid process is preferable for commercial work with fairly pure alcohol but the sodium nitrite-sulphuric acid process is preferable when very pure alcohol is used and a product of great purity desired.
4. That a very pure alcohol seems to be less easily converted to nitrite by the nitrous acid process than one less pure.
5. That, while the most of an alcohol may be easily changed to nitrite by the nitrous-acid process, the last portions are much more difficult to convert.
6. That the amyl nitrites made from the first and last fractions of an alcohol boiling chiefly between 128° and 132° differ slightly in boiling point.
7. That certain compounds of very high boiling point are produced.
8. That pyridine nitrate is produced by the nitrous-acid process from even a very pure alcohol and to a greater degree from less pure varieties.
9. That amyl nitrite shows a reduction of acidity by distillation.
10. That a binary mixture of pure amyl nitrite and water distil at about 80° and this fact may be used as a more delicate test for moisture in amyl nitrite than the freezing method.
11. That neither the assay nor distillation alone give reliable information as to the character of amyl nitrite.
12. That considering the results obtained the following is by no means too high a standard:—

Specific Gravity.—0.870—0.880 @ 15°=0.865—0.875 @ 25°.

Acidity.—U. S. P.

Aldehyde.—U. S. P.

Nitrate.—No more than a faint trace when tested by the method given.

Assay.—The U. S. P. method, modified to require not less than 90 percent.

Boiling Point.—At least 80 percent to distil between 90° and 100°.

Moisture.—No traces of water to be shown at the beginning of distillation by a momentary lowering of the boiling of any part to about 80° C.

FROM THE LABORATORIES OF THE PARKE, DAVIS CO.

REVIEW OF CURRENT PHARMACEUTICAL LITERATURE.*

CHARLES H. LAWALL, PH. M.

The following abstracts are intended to give, in as brief a form as possible, the literature of the month having a practical bearing, direct or indirect, upon the subject of pharmacy and allied sciences. No attempt has been made to consider articles written from the purely academic standpoint, although a number of such articles, most of them excellent in character, are scattered throughout the journals for the month:—

JOURNAL OF INDUSTRIAL AND ENGINEERING CHEMISTRY.

The Determination of Mercuric Iodide in Tablets:—The difficulties in the way of estimating mercuric iodide in tablets are outlined and a method is proposed, based upon the oxidation of organic matter and solution of the mercuric compound by digestion with an acidulated solution of potassium chlorate under a reflux condenser. The final determination is made by precipitation of the mercury as mercuric sulphide. The results range within 3 or 4 percent. of the correct figures in known samples.—A. W. Bender, Sept., 1914, p. 753.

Estimation of Antipyrin:—A very satisfactory method for the quantitative determination of antipyrin, based upon its absorptive power for iodine, is proposed, which is satisfactory in the presence of phenacetin, acetanilid or sulfonal, and which, in known mixtures, enabled recoveries within 1% of the correct amount to be made.—W. O. Emery and S. Palkin, Sept., 1914, p. 751.

The Ferric Alum Estimation of Casein:—The authors compare the Kjeldahl nitrogen-determination method of estimating casein, with a method based upon the reaction and precipitation which occurs when milk is mixed with a standard solution of ferric alum, the excess of the latter being determined by the well-known iodometric method. The time consumed in carrying out the proposed method is only 35 minutes and according to tabulated results its accuracy compares favorably with the more tedious and time-consuming methods which have been used heretofore.—H. V. Arny and H. H. Schaefer, Sept., 1914, p. 748.

Hypothetical Combinations in Water Analysis:—This is a very complete resumé of a difficult subject, and one upon which all the light that can be thrown is needed. The various inconsistencies and errors shown in reports of water-analyses, which makes it frequently necessary to entirely re-calculate the analytical findings of one chemist, in order to bring them to a suitable basis for comparison with another, are dwelt upon in detail. The author condemns the frequently employed method of reporting the substances found in their hypothetical combinations and favors reporting the analysis in ionic form.—R. B. Dole, Sept., 1914, p. 710.

The Effect of Bread Wrapping on the Chemical Composition of the Loaf:—This is an exhaustive study of the subject, showing the results in graphic charts. The conclusions are emphatically in favor of the wrapping of bread, as a needed sanitary measure, which in no way detracts from the nutritive value or the palatability of the product.—H. E. Barnard and H. E. Bishop, Sept., 1914, p. 736.

THE PRACTICAL DRUGGIST.

Camphor and Its Preparations:—This is a continuation of a most interesting and valuable article. In the present instalment the author gives formulas for a number of unofficial

* Read at the Philadelphia Branch of the American Pharmaceutical Association, Oct., 1914.

preparations of the drug, including the following, which are not usually found in American works of reference, but are occasionally called for by foreign practitioners:

Collyrium Astringens Lutenum Violii.

Unguentum Hæmorrhoidale.

Aqua Cosmetica.

Unguentum Ophthalmicum Comp. (P. G.).

Emulsio Camphorata.

The paper concludes with a consideration of some difficult combinations of camphor to be dispensed in pill form.—J. Leon Lascoff, Sept., 1914, p. 382.

Figuring the Selling Price:—The perennial topic of the calculation of net profits and the method of obtaining the proper figure for the selling price is graphically illustrated in this article, which includes tables so simple and yet so comprehensive that any desired net profit may be estimated almost at a glance.—A. G. Houston, Sept., 1914, p. 384.

AMERICAN JOURNAL OF PHARMACY.

Rhamnus Purshiana:—A very interesting and comprehensive article upon the subject, well illustrated. It is interesting to note that the original specimens which served as the type for the classification and naming of the plant were collected by Lewis and Clark on their famous expedition to the Northwest in 1805 and 1806 and sent to Frederick Pursh, the well-known Philadelphia botanist. Pursh named the plant *Rhamnus alnifolia*, but De Candolle, a contemporary botanist, in 1825, changed the name to *R. Purshiana* in honor of Pursh. A specimen was growing in Bartram's Gardens, Philadelphia, as late as 1838, and served as a basis for Rafinesque's studies of this for his "Silva Telluriana."—C. W. Johnson and Edith Hindman, Sept., 1914, p. 387.

The Insecticidal Value of Fluidextract of Larkspur Seed:—The author made a number of experiments upon the comparative value of the preparation as made with various menstrua and with preliminary treatment of the drug with various solvents. His conclusions are that the preliminary removal of the oil and its rejection, as frequently practiced for the purpose of giving a clear, bright preparation, is inadvisable and that the menstruum which will extract the largest proportion of fixed oil is the proper one to use. The preparations of highest efficiency were those in which petroleum benzin was used to first extract the drug, the residue from the evaporation of the benzin being subsequently taken up with 95% alcohol, in which it seems to be almost completely soluble. The preparation made in this manner proved to be more than six times as strong as a preparation made by simple extraction with diluted alcohol and ten times as strong as one made with 30% alcohol.—J. B. Williams, Sept., 1914, p. 414.

JOURNAL AMERICAN CHEMICAL SOCIETY.

Some Natural Indicators:—The author has made a very interesting study of the indicator value of the natural coloring matter of about 30 varieties of wild flower petals and those of some cultivated plants in which the most interesting feature seems to be the fact that none of the yellow colors of flowers are affected by either acids or alkalies, while whites are changed to yellow by alkalies and reds and purples are changed to some shade of green or blue by alkalies and back to their original color or a brighter shade by acids.—H. W. Brubaker, Sept., 1914, p. 1925.

JOURNAL OF THE FRANKLIN INSTITUTE.

Occurrence of Aldehydes in Garden and Field Soils:—Salicylic aldehyde was found in soils which had been found to be unproductive. The soils examined were from various parts of the U. S. Out of 14 garden soils, 5 contained aldehydes, and of 60 field soils, 19 contained aldehydes. Check experiments made with salicylic aldehyde upon growing plants showed the retardation to amount to from 30 to 40 percent.

The reaction of the soil or the character of the crop seemed to have no bearing upon the occurrence of the aldehyde. No proportions are given. Of 30 productive soils but 3 contained aldehydes, while of 30 unproductive soils, aldehydes were found in 9. It is not known

whether salicylic aldehyde is the only member of that group occurring in soils, but positive reactions were obtained for that one in every instance when aldehydes were found to be present.—Oswald Schreiner and J. J. Skinner, Sept., 1914, p. 329.

JOURNAL AMERICAN MEDICAL ASSOCIATION.

Potassium Permanganate, a Substitute for:—The prohibitive price to which potassium permanganate soared soon after the outbreak of the war in Europe and the fact that large quantities of the article were used in house-disinfection by the Health Department of Pennsylvania, led to an investigation of the subject by Charles H. LaWall at the request of the Commissioner. This investigation showed that Sodium Dichromate can be used for this purpose if the formaldehyde solution be previously acidulated with 15% of its volume of commercial sulphuric acid. The disengagement of gas is more prompt than with the permanganate, and as far as general comparative effects are concerned the reaction seems to be equally effective.—Dr. Samuel G. Dixon, Sept. 19, 1914, p. 1025.

DRUGGISTS CIRCULAR.

Digitalis and Its Preparations:—Dr. Hatcher's article, which is the first instalment only, may without any derogation to the author, be characterized as a most thorough example of scientific iconoclasm.

The pharmacological studies which have been made by competent observers have resulted in overthrowing a number of the earlier beliefs concerning this drug, many of which have persisted and are still current. Among these beliefs that have been contradicted by Hatcher are:—

First, that the wild plant is more valuable than the cultivated.

Second, that the leaves of the second year's growth are superior to those of the first.

Third, that the leaf grown in certain geographical regions is more potent than that grown in others.

Fourth, that the activity of the leaves rapidly deteriorates unless they are kept with unusual precautions.

Fifth, that the infusion and the tincture differ in the character of their therapeutic effect.

The preparation of the infusion from the fluidextract is stated to be productive of a very average infusion made directly from the drug, which is almost impossible to exhaust with unsightly product which, however, is very likely to be more active therapeutically than the boiling water, according to Dr. Hatcher, unless it be ground to No. 60 powder.—Robert A. Hatcher, M. D., Sept., 1914, p. 517.

BULLETIN OF PHARMACY.

Startling Inaccuracy in Scales, Weights and Measures:—This is not a sensational headline from a yellow journal, but a statement of facts relative to the inspection of weights and measures in drug stores in Wisconsin by the official having charge of that department of state work.

In this investigation it was found that 43.6% of prescription weights were inaccurate, 22% of the scales were found to be defective or inaccurate, and 45% of the graduates incorrect.

Similar inspections have been made by inspectors in the States of Massachusetts and Kansas with equally startling results.

Prescription bottles were also inspected in Wisconsin and 23% were found to be undersized and 10% oversized.

The inspector, in commenting upon the causes of inaccuracy in weights and scales, states that much of the trouble is undoubtedly due to improper methods of cleaning with acids, alkalis or polishing compounds.—Sept., 1914, p. 384.

BULLETIN KANSAS BOARD OF HEALTH.

Coinced Word Substitutes for Beauty Drugs:—This article is a most complete review of the many products advertised so cleverly in the newspapers under the caption "Health and

Beauty Hints," or some other similar heading, and in which the information is given in the shape of fictitious answers to mythical correspondents.

Amarol, Epp-o-tone, May-a-tone and Sartoin consist principally of magnesium sulphate with from 8 to 20 percent. of borax or boric acid.

Spurmax is magnesium salts perfumed. Saxolite is magnesium sulphate and alum.

Boric acid, zinc oxide and sodium thiosulphate (Hypo) are the principal ingredients in Almazoin, Borothol, Cerol, Citrox, Flowers of Oxzoin, Luxor and Zintone.

Ammoniated mercury, a dangerous poison for indiscriminate use in a toilet preparation is present in Freckle Cream, Mergolized Wax, Othine and Tanazin. "Antifreckle Lotion" was found to contain soap, water and corrosive sublimate.

A "wrinkle lotion" was found to be composed of alum, glycerin and water.

Eptol consists of soap, water and borax.

Clearola is composed entirely of sulphur.

Cuticle acid is a 2% solution of oxalic acid in alcohol and water.

Among the skin cleaners was Gloriol Glowene, consisting entirely of soft soap.

Kulux Compound contains bismuth, zinc oxide and glycerin and water.

Among the shampoo preparations which contain borax, soap and alkaline carbonates in varying proportions are Am-o-tone, Capthol, Therox and Canthrox.

Capo-oil and Adora Hair Dressing, both used for the hair, were found to contain wood alcohol as a solvent.

Quinzoin and Quinola, for dandruff, consisted of sodium bicarbonate, ground quassia and quinine.

Perfumed vaseline was advised for silky eyebrows under the name Pyroxin.

Delatone and Delol, both depilatories, contain principally barium sulphide.

Quintone contained hyposulphite of soda and borax.

Among the flesh reducers are Parnotis, composed of baking soda and Glauber's salt, and Marnola, containing phenolphthalein and dried thyroid extract.—L. A. Congdon, Sept., 1914, p. 210.

REPORT N. Y. CITY BOARD OF HEALTH.

The Pro and Con of Artificial Flavors and Colors.:—This is an interesting review of the subject, going into details to some extent and citing interesting examples as illustrations of various points. The summary is as follows:

1. Many synthetic flavors and odors are decidedly injurious to the human organism, either through their action, *per se*, or through their decomposition products.

2. With a few exceptions they are merely imitations and not identical with the real substances desired.

3. Only very rarely are these unnatural adjuvants to be classed as foods.

4. None are really vitally necessary since natural flavors and odors are available to everyone.

5. They may be used for fraudulent purposes.

6. At best, they are of doubtful value and wherever there is any doubt the consumer should have the preference.—Sept. 19, 1914.

REPORT OF COMMITTEE ON UNOFFICIAL STANDARDS.

The following portion of the report of the Committee on Unofficial Standards relates to certain crude drugs and chemicals suggested for inclusion in the next revision of the National Formulary, and by order of the Council is published in the JOURNAL in order to afford opportunity for discussion before the standards proposed are finally adopted.

Manufacturers, importers, analysts, and others interested in any of the proposed standards, are requested to send their criticisms and comments to the chairman of the committee, Geo. M. Beringer, 501 Federal St., Camden, N. J.

APPROVED MONOGRAPHS SUBMITTED AS STANDARDS FOR UNOFFICIAL DRUGS AND CHEMICAL PRODUCTS.

ALLIUM.

Allium. Garlic.

1. The bulb of *Allium sativum* Linné (Fam. *Liliaceae*). Bulb subglobular, 4 to 6 cm. broad, compound, consisting of 8 to 15 bulbels (so called "cloves") and surrounded by 1 or 2 dry, whitish, membranaceous scales and attached to a flattened circular base from the lower portion of which arise numerous yellowish-white roots, bulbels more or less ovoid, in transverse section 3 to 4 sided, the outer surface being convex, summit acute and narrowed into a thread-like fibrous portion, base truncate, each bulbel covered by one or two layers of whitish, membranaceous scale-like leaves, beneath which is the light brown and pinkish, thin and coriaceous layer of epidermis, cohering but easily separable from the solid portion of the bulbel; odor of broken or bruised bulbel aromatic, disagreeable; taste intensely pungent and persistent.

Under the microscope, transverse sections show three distinct portions: (a) the large fleshy scale consisting chiefly of parenchyma enclosing scattered vascular bundles, epidermis in both ventral and dorsal surfaces consisting of small tubular cells; (b) the middle layer nearly circular in outline, about 0.750 mm. in diameter, the tissues resembling those of the outer fleshy scale, but the cells containing numerous yellowish-brown plastids; (c) an innermost bright green layer consisting of a single leaf folded lengthwise along the midrib so that the ventral surfaces lie close together.

Garlic should be used in the fresh condition only.

FLORES VERBASI.

Mullein Flowers.

1. The dried corollas, with adhering stamens, of *Verbascum phlomoides* Linné, or of *V. thapsiforme* Schraeder, (Fam. *Scrophulariaceae*).

2. *Verbascum* flowers should be kept in a tight, dry container.

3. Corolla light-yellow, the outer surface grayish with a fine soft woolly indumentum, the inner surface sparsely hairy and finely veined; tube of the corolla only 1 or 2 mm. long and almost equally broad, the limb from 14 to 30 mm. broad, between wheel-shaped and saucer-shaped, obscurely two-lipped, the unequal lobes rounded-obovate. Stamens five, borne on the base of the corolla, shorter than the corolla, two of them longer than the other three, the filaments thick and fleshy, more or less pilose, especially the three shorter, usually orange colored. Stamen-hairs cylindrical, unicellular, non-branching, surface minutely reticulate, apex rounded, frequently enlarged. Pollen grains smooth, triangular and more or less rounded, 0.025 to 0.030 mm. in diameter. Odor peculiar, agreeable; taste mucilaginous, not agreeable. The flowers impart a yellow color when boiled with water, and a rather permanent green with dilute sulphuric acid, which latter color becomes brown upon the addition of alkalis.

HYDRANGEA.

Hydrangea. Seven-barks.

1. The dried rhizome of *Hydrangea arborescens* Linné (Fam. *Saxifragaceae*).

2. Rhizome, cylindrical, usually cut into

pieces 3 to 10 cm. in length, 3 to 20 mm. in diameter; light brown to yellowish-brown with a pinkish tinge, longitudinally wrinkled, marked by few elliptical lenticels and occasional prominent buds, short branches or stem scars, and from the lower surface arise a few coarse fibrous roots; fracture tough, splintery; internally yellowish-white or light brown, bark thin, easily separable from the distinctly radiate wood which surround a prominent whitish pith; inodorous; taste of the bark sweetish, becoming slightly acrid. Roots attaining a length of 25 cm. and a thickness of 2 mm., irregularly bent and branching, otherwise resembling the rhizome with the exception of the pith being wanting.

3. Under the microscope, sections of the rhizome of *Hydrangea* show a gray cork of a few rows of tabular cells, a cortex made up chiefly of parenchyma containing starch, large cells containing raphides and small isolated groups of stone cells or sclerenchymatous fibers; a woody cylinder composed of slender wedges made up of prominent tracheae with reticulate thickenings and tracheids separated by medullary rays 1 to 3 cells wide, the cells of which are filled with small starch grains; pith of large polygonal cells with prominent simple pores.

4. Powder: Light yellowish-brown, containing irregular fragments consisting of strongly lignified tracheae, tracheids and medullary ray cells; stone cells and sclerenchymatous fibers, 0.050 to 0.200 mm. in length, strongly lignified, the walls marked by simple and branching pores; raphides numerous, 0.070 to 0.130 mm. in length; starch grains mostly single, more or less ellipsoidal, occasionally with a prominent central cleft and varying from 0.002 to 0.010 mm. in diameter.

INULA.

Inula. Elecampane.

1. The dried rhizome and roots of *Inula Helenium* Linné (Fam. *Compositae*), with not more than 5 percent. of its stem bases.

2. Rhizome usually split into longitudinal or more or less oblique pieces to which may be attached one or more of the roots; up to 8 cm. in length and 4 cm. in diameter; externally grayish-brown to dark-brown, longitudinally wrinkled with occasional buds or stem scars and surmounted at the crown by a portion of the over ground stem; inner or cut surface somewhat concave, the edges in-

curved with the overlapping bark, yellowish-brown to grayish-brown, longitudinally striate and more or less fibrous near the cambium zone; fracture short and horny; inner surface light brown and marked by numerous circular or elliptical oleo-resinous canals; roots cylindrical and tapering, frequently curved or irregularly curled, up to 13 cm. in length and 1.5 cm. in diameter; odor aromatic; taste acrid, bitter and pungent.

3. Sections under the microscope show a corky layer of 4 to 7 rows of broad tabular cells; a cortex of numerous parenchyma cells containing inulin in irregular or fan-shaped masses and a number of large intercellular oleo-resinous reservoirs arranged in nearly radial rows and forming interrupted circles; woody portion consisting chiefly of parenchyma, a number of tracheae with simple pores or reticulate thickenings and associated occasionally with a few strongly lignified wood fibres, and oleo-resinous reservoirs similar to those occurring in the bark; parenchyma cells in the pith of the rhizome large, containing less inulin than the cells of the wood and bark and separated by large intercellular spaces.

4. Powder: Light brown; consisting chiefly of fragments of parenchyma containing inulin and small irregular separated masses of inulin; tracheae with simple pores and reticular thickenings associated occasionally with strongly lignified wood fibres; occasional reddish-brown fragments of the walls of the oleo-resinous canals.

IRIS.

Orris.

1. The rhizome of *Iris florentina* Linné *Iris Germanica* Linné, and *Iris pallida* Lamarck (Fam. *Irideae*), freed from the roots, peeled and dried.

2. In pieces of various form and size, sometimes branched, 5 to 10 cm. long and 2 to 3 cm. in diameter, usually round and plump or flattened and showing knotty enlargements. The under surface may show numerous round root scars and the upper surface remains of leaf scars; externally white or yellowish-white; fracture rough, showing a narrow cortex, a brown cambium layer and large central stele. Odor fragrant, resembling that of the violet; taste aromatic and bitter. The ash should not exceed 6 percent.

MACIS.

Mace.

1. The arillode of the seed of *Myristica fragrans* Houttuyn (Fam. *Myristicaceae*).

2. In narrow bands, 25 mm. or more long, somewhat branched and lobed above, united into broader bands below; yellowish to brownish-orange; greasy; odor fragrant; taste warm and aromatic.

3. When powdered, orange-buff to orange-brown in color. Mounted in water and examined microscopically the powder exhibits elongated epidermal cells; parenchyma containing very small amyloextrin granules, which are colored red-brown by iodine T. S.; large oil cells the contents of which are not greatly changed in color on the addition of alkali.

4. Powdered false or Bombay mace is yellow-brown to deep-brown in color and deficient in odor and taste. When mounted in water and examined microscopically it exhibits flattened thick-walled epidermal cells and oil cells much more numerous than in true mace and containing an orange-red resinous substance which is dissolved by alkalis to a blood-red liquid.

5. When moistened with hydrochloric acid, no greenish color should be produced (difference from and absence of arillode of *Myristica Malabarica* Lamarck or Bombay Mace).

6. If an alcoholic extract of Mace (1-10) be treated with potassium chromate T. S., the precipitate formed should be yellow, not changing to red on standing, nor should the solution develop a red coloration (difference from and absence of Bombay Mace).

7. If a piece of filter paper be saturated with an alcoholic extract of Mace (1-10), and 1 drop of potassium hydroxide T. S., be added, no blood-red coloration should be produced (difference from and absence of Bombay Mace).

8. The ash should not exceed 3 percent. and this should be almost completely soluble in hydrochloric acid.

9. Mace should yield not less than 8 percent. of volatile ether extract, and not less than 20 percent. nor more than 30 percent. of non-volatile ether extract.

PETROSELINUM.

Parsley Root.

1. The root of *Petroselinum sativum* Hoffmann (Fam. *Umbelliferae*).

2. The entire fusiform root up to 20 cm. in length and up to 2.5 cm. in thickness at the crown, or somewhat broken or cut into pieces; usually cut lengthwise into two or four sections, externally light yellowish wrinkled longitudinally, somewhat annulate, root scars distinct and corky; fracture tough when damp, brittle when dry; internally, cortex whitish and characterized by numerous reddish-brown oleo-resin cells, cambium zone distinct and brownish, wood about the same thickness as the cortex, slightly radiate and light yellowish in color. Odor aromatic; taste sweetish and pungent.

3. The powdered drug shows numerous truncate or somewhat angular starch grains up to .030 mm. in diameter, reticulate tracheae up to .060 mm. in width and thin walled, lignified fibers with simple pores.

4. Ash not more than 6 percent.

PIMPINELLA.

Pimpernel Root.

1. The dried rhizome and roots of *Pimpinella Saxifraga* Linné, or *Pimpinella magna* Linné (Fam. *Umbelliferae*).

2. Cylindrical or slightly tapering, about 10 to 20 cm. in length and from 1 to 1.5 cm. in diameter at the crown, frequently branching, sometimes split longitudinally or broken into pieces; the upper or rhizome portion annulate, with undeveloped stem buds and a few attached stem remains which should not be over 5 cm. in length; roots longitudinally wrinkled, slightly annulate, cortex thin, easily detached; fracture short when dry, tough and flexous when damp; externally light yellowish-brown; internally porous, cortex broad and whitish with numerous groups of projecting radial bast fibers and reddish-brown oleo-resin cells, wood yellowish, usually with a few indistinct fibers, medullary rays interrupted, cambium zone distinct; odor, aromatic; taste sweetish, pungent and acrid.

3. The powdered drug shows numerous simple or 2 to 4 compound starch grains from .004 to .010 mm. in diameter; secretion canals from .050 to .060 mm. in diameter; trachea reticulate or scalariform .035 to .070 mm. broad; fibers, thin walled numerous, thick walled with simple pores few (*P. magna*).

POTASSII FORMAS.

Potassium Formate.

1. It should contain, when dried, not less

than 98 percent. of potassium formate ($\text{KCOOH} = 84.11$). It should be kept in well-stoppered bottles.

2. Very deliquescent, colorless crystals, or white crystalline powder, odorless, taste saline bitter.

3. It is very soluble in water, soluble in alcohol.

4. Its aqueous solution is slightly alkaline to litmus, but should not redden phenolphthalein.

5. When the salt is heated, hydrogen is evolved and a residue is left which effervesces with acid, and imparts to a non-luminous flame a violet color.

6. On adding sodium bitartrate T. S. to the aqueous solution of the salt (1:20) a white crystalline precipitate is slowly formed which dissolves on the addition of ammonia water.

7. When ferric chloride T. S. is added to the aqueous solution of the salt (1:20) a red color is produced which is discharged by strongly acidulating with sulphuric acid.

8. The addition of mercuric chloride T. S. to the warm aqueous solution of the salt (1:20) produces a white precipitate of mercurous chloride, which turns gray on further warming in the presence of an excess of the formate.

9. The aqueous solution of the salt (1:100) should comply with the U. S. P. test for Limit of Heavy Metals.

10. 10 cc. portions of the aqueous solution of the salt (1:20) slightly acidulated with acetic acid should not be rendered turbid within five minutes by the addition of ammonium oxalate T. S., (calcium), or by calcium chloride T. S. (oxalic acid).

11. Weigh accurately about 2 gm. of Potassium Formate, previously dried to constant weight at 120°C . and ignite it thoroughly at a temperature not exceeding a red heat. Dissolve the residue in hot distilled water, filter, if necessary, and wash until washings cease to affect phenolphthalein. Then cool the solution and titrate with normal sulphuric acid V. S., using methyl orange as indicator. The number of cc. of normal sulphuric acid V. S. consumed should indicate not less than 98 percent. of potassium formate. Each cc. of normal sulphuric acid V. S. corresponds to 0.08411 gm. potassium formate.

QUININAE VALERAS.

Quinine Valerate.

1. The Valerate of the alkaloid quinine. It should be kept in well-stoppered amber-colored vials.

2. White lustrous crystals, having an odor of valeric acid and an intensely bitter taste.

3. It is very sparingly soluble in cold water, soluble in hot water, becoming less soluble by age on account of loss of valeric acid; readily soluble in alcohol.

4. Its aqueous solution is neutral or slightly alkaline to litmus.

5. On treating 10 cc. of the aqueous solution of the salt (1:1000) with a few drops of bromine water, then with an excess of ammonia water, an emerald green color will be produced.

6. The aqueous solution acidulated with sulphuric acid exhibits a blue fluorescence and emits the odor of valeric acid.

7. On incinerating 1 gm. of Quinine Valerate, not more than 0.1 percent. of ash should remain.

8. About 0.1 gm. of the salt should dissolve in 5 cc. of sulphuric acid without producing more than a light-yellow color (readily carbonizable impurities).

9. 10 cc. portions of the cold saturated aqueous solution of the salt should not give more than a slight turbidity with barium chloride T. S. when acidulated with hydrochloric acid (sulphate) or with silver nitrate T. S. when acidulated with nitric acid (chloride).

10. The quinine obtained by shaking out the salt with ammonia water and chloroform should comply with the U. S. P. test for absence of excessive amounts of other cinchona alkaloids.

SODII FORMAS.

Sodium Formate.

1. It should contain, when dried, not less than 98 percent. of anhydrous sodium formate ($\text{NaCOOH} = 68.01$). It should be kept in well-stoppered bottles.

2. A white crystalline powder, or colorless crystals, containing one molecule of water; odorless and having a saline bitter taste.

3. It is very soluble in water, sparingly soluble in alcohol.

4. Its aqueous solution is slightly alkaline

to litmus, but should not redden phenolphthalein.

5. When the salt is heated, hydrogen is evolved and a residue is left which effervesces with acid and colors a non-luminous flame intensely yellow.

6. Ferric chloride T. S. added to the aqueous solution of the salt (1:20) produces a red color which is discharged by strongly acidulating with sulphuric acid.

7. The addition of mercuric chloride T. S. to the warm aqueous solution of the salt (1:20) produces a white precipitate of mercurous chloride which turns gray on further warming in the presence of an excess of the formate.

8. The aqueous solution of the salt (1:100) should comply with the U. S. P. test for Limit of Heavy Metals.

9. 10 cc. portions of the aqueous solution (1:20) slightly acidulated with acetic acid should not be rendered turbid within five minutes by ammonium oxalate T. S. (calcium) or by calcium chloride T. S. (oxalic acid).

10. Weigh accurately about 2 gm. of sodium formate, previously dried to constant weight at 120° C. and ignite it thoroughly in a crucible at a temperature not exceeding a red heat. Dissolve the residue in hot distilled water, filter, if necessary, and wash until washings cease to affect phenolphthalein. Then cool the solution and titrate with normal sulphuric acid V. S., using methyl orange as indicator. The number of cc. of normal sulphuric acid V. S. consumed should indicate not less than 98 percent. of anhydrous sodium formate. Each cc. of normal sulphuric acid V. S. corresponds to 0.06801 gm. of anhydrous sodium formate.

STRYCHNINAE VALERAS.

Strychnine Valerate.

1. The Valerate of the alkaloid strychnine. It should be kept in well-stoppered amber-colored vials.

2. A white crystalline powder, having an odor of valeric acid and an intensely bitter taste.

3. It is sparingly soluble in water, becoming less soluble by age on account of loss of valeric acid; soluble in alcohol or chloroform; slightly soluble in ether.

4. Its aqueous solution is neutral or slightly alkaline to litmus.

5. On dissolving about 0.05 gm. of Strychnine Valerate in 2 cc. of sulphuric acid not more than a faint yellowish color should be produced, but on adding a fragment of potassium dichromate a deep violet color will be produced which changes to orange or yellow.

6. When sulphuric acid is added to the salt, the odor of valeric acid is evolved.

7. On incinerating 1 gm. of Strychnine Valerate, the ash should not exceed 0.1 percent.

8. 10 cc. portions of the aqueous solution of the salt (1:100) should not be affected at once by barium chloride T. S. when acidulated with hydrochloric acid (sulphate) or by silver nitrate T. S. when acidulated with nitric acid (chloride).

9. About 0.02 gm. of the salt moistened with nitric acid may be colored yellow, but should not become red or reddish (brucine).

THYMUS.

Thyme.

1. The dried tops of *Thymus vulgaris* Linné (Fam. *Labiatae*) collected when the plant is in flower.

2. Stems quadrangular, about 0.5 mm. in diameter, greyish-brown or purplish in color, pubescent, nodes from 5 to 20 mm. apart, occasionally with the opposite leaves attached; leaves linear, linear lanceolate, or ovate oblong, 0.5 to 4 mm. long and from 0.5 to 2 mm. broad, apex acute, base obtuse tapering into a petiole 0.5 to 2 mm. long, margin revolute, upper surface greyish-green, puberulent, with numerous one-celled thick-walled, non-glandular hairs, lower surface greyish, pubescent, with non-glandular one to four-celled, thick-walled, rough simple hairs, up to 0.135 mm. in length and usually curved at the first joint in the bases, numerous compound glandular secreting hairs with a short one-celled stalk occurring chiefly on the upper surface and depressed in the cuticle give the leaf a glandular-punctate appearance; inflorescence in about twelve-flowered axillary whorls; flowers polygamous, calyx tubular, about 4 mm. long, ovoid or slightly curved on the lower side near the base, 9 to 12 nerved, pubescent, the throat bearded with longitudinally striated straight simple hairs up to 1 mm. in length, bilabiate, upper lip three-toothed,

lower lip with two hairy ascending attenuate divisions, corolla about twice as long as the calyx, purplish, smooth within, slightly pubescent without, upper lip emarginate, lower spreading and three lobed, stamens slightly

didynamous and exerted, stigma bifid; nutlets about 0.5 mm. in diameter, spheroidal and finely tuberculate. Odor agreeable, aromatic; taste aromatic and warming.

3. Ash not more than 10 percent.

X-RAYS SHOW ETHER WAVES.

Professor W. H. Bragg delivered at the British Royal Institution a lecture on X-Rays and crystalline structure. Two years, he said, had gone by since Dr. Laue made his surprising discovery of the interference effects accompanying the passage of X-Rays through crystals. The pioneer experiment had opened the way for many others, and a very large amount of work, practical and theoretical, had now been done. There was work enough in sight to absorb the energies of many experimenters, and there was sure to be far more than we could see. It would scarcely be an over-statement to say that Laue's experiment had led to the development of a new science. The experiment itself, which, to put it briefly, constituted a proof that X-Rays consisted of extremely short ether rays, had already been described and was well known. A fine pencil of X-Rays passed through a thin crystal slip and impressed itself on a photographic plate. Round the central spot were found a large number of other spots, arranged in a symmetrical fashion, their arrangement clearly depending on the crystal structure.

Mr. W. L. Bragg (the lecturer's son) had discovered the "reflection" method, and had shown that it was able to elucidate the position of all the spots on the Laue photograph. This conception led to the construction of the X-Ray spectrometer, which resembled an ordinary spectrometer in general form, except that the grating or prism was replaced by a crystal and the telescope by an ionisation chamber and an electroscope. In use a fine pencil of X-Rays was directed on the crystal, which was steadily turned until a reflection leaped out, and the angle of reflection was then measured. If we used different crystals or different faces of the same crystal, but kept the rays the same, we could compare the geometrical spacings of the various sets of planes. If we used the same crystal always, but varied the source of X-Rays, we could analyze the X-Rays, measuring the relative wave lengths of the various constituents of the radiation.

At this stage a critical point had been reached. If we knew the exact spacings of the planes of some one crystal we could by comparison find the spacings of all other crystals and measure the wave lengths of all X-radiations. Or if we knew the exact value of some one wave length we could find by comparison the values of all other wave lengths and determine the spacings of all crystals. But at this stage there was no absolute value either of wave length or spacings.

Mr. W. L. Bragg appeared to have overcome the difficulty by his comparison of the reflecting effect in the case of rock salt or sodium chloride and sylvine or potassium chloride, and the spectrometer had now become a means of measuring the length of waves of any X-radiation and the actual spacings of the atoms of any crystal.

BETTER DRUGS AS WELL AS FOODS.

MR. FRED WINDOLPH, NORWICH, N. Y.

The following address was delivered by Mr. Windolph at the recent meeting of the Association of Dairy Food and Drug Officials and was highly commended:

I am to speak to you today on behalf of the American Association of Pharmaceutical Chemists and, as I understand it, with reference to the relation which might exist or should exist between your honorable body and the manufacturers of medicinal products. The very able remarks which were made yesterday with reference to food products are applicable in a large measure to the conditions which exist in the manufacture of pharmaceuticals. But in addition to that we, as drug manufacturers, have problems which possibly the food men have not. And in speaking of "drug products" I do not refer to what are ordinarily known as patent medicines.

Our association is the oldest association of manufacturing pharmaceutical chemists. We were the first ones to organize for our mutual benefit and for the advancement of the science of pharmaceutical manufacturing.

I say we are the oldest, but even that does not date our beginning back very many years because it has only been within a few years that the manufacturers have gotten together and discussed the problems which enter into their daily work.

We make the preparations which are used by the physicians and which are prescribed by physicians for the alleviation of human suffering. We make thousands and thousands of pharmaceuticals and these are made in various forms. And, having so many items to handle, so many drugs and constituents to handle, we have many problems which cannot come to the manufacturer who specializes upon but a single thing.

If we were manufacturers of patent medicines it would be a simple matter for us to learn how we should label our goods and then our troubles would be over.

But we have, in the first place, the various medicines which enter into these preparations. They are not only chemical but they are vegetable constituents and they come to us from all corners of the earth in varying conditions. It is necessary for us to standardize our raw materials and we have our own difficulties there, as I am sure those of you who have anything to do with the importation of these chemical and vegetable ingredients will agree. We have our troubles in getting the proper materials to start with and then in the course of manufacture. We find it necessary to have control departments, employing a corps of chemists to assay and analyze the drugs, and then to pass upon the finished product. We have our troubles even after they leave our hands, so that you see the manufacturers' lot is not altogether a happy one. And when, added to these troubles, come questions of interpretations of the laws as to the proper labels for goods, there we are confronted with a condition which makes us welcome very heartily indeed the sentiment—that there should be uniformity in the laws throughout the country so that when we get an answer from one state or federal government as to labeling products we will know that that same answer will suffice.

We are more than glad to see this spirit manifested. And I was very much pleased to hear the discussion in reference to the net weights and measures law, the disposition that was shown by the state commissioner to wait for the national government to lay down its regulations for tolerance and so on before they make them in the states, so that when we do have them they will be uniform everywhere.

Then there is another matter which has been brought up here which gives us great hope and faith to believe that there is balm in Gilead. That is your constructive work for helping the manufacturers not only in the decision on technical questions in reference to labels, but also as to processes and in the conservation of waste products and other matters which enter in the practical manufacture of goods. In that you are undertaking a grand work, and it is one which will not only redound to the benefit of the manufacturer but to the country at

large. The most excellent paper by Dr. Barnard was a wonderful contribution along those lines. Dr. Kebler has done a great work for the manufacturers of pharmaceuticals in his very efficient investigation into the manufacture of tablets. He has written a wonderful paper on that subject which has been published in the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION and which will undoubtedly be of great benefit to every manufacturer of tablets in the country. I also wish to thank you gentlemen for the most excellent information which you put into these bulletins which you send out from time to time. My only regret is that we don't get more of them from more of the states.

The association which I represent was formed for this purpose of bettering the production of the articles of the manufacturers who belong to that association and, really, for the improvement of all who are engaged in the manufacture of medicinal products. Our aim is to get better raw materials, to eliminate waste, to improve methods of manufacture, and to make better goods where we can raise our standards—and we have found that all this has been of great benefit to us individually. We are all competitors, of course, and in days gone by we did not meet with one another, we did not consult one another. We felt that we could not associate very much with our competitors, but we find now that there is a great deal we can do for each other, and if in the constructive work which you contemplate we can coöperate with you gentlemen, the work will be magnified and redound not only to your good and to our good but to the good of the people of the country at large. And, feeling, as I do, that there is a light breaking which helps to guide our pathway, I wish to thank you for permitting us as manufacturers of one particular line, to appear before you, and I wish to join in all the good words which have been said by the manufacturers here, and I wish also to say that I think we are all disposed to work in harmony with the known wishes of the gentlemen who are in charge of the administration of these laws. We, who were present this morning at the musical concert, had a manifestation of the beauties of harmony. Those of us who listened to that magnificent concert, had a manifestation of a true symphony. Those of us who listened to that magnificent concert could not help but be impressed with the great harmony of that wonderful organ. When the magnificent instrument responded to the touch of the organist I think we all felt lifted out of ourselves; we thought a little better of ourselves even, and certainly we thought more of our fellow-men. And so in the operation of the pure food laws as they apply to the manufacturers of this country, if we can have a spirit of harmony and coöperation I believe that we will all be better men, better executives, and better manufacturers, and in that way we will be doing much better and greater service for our country and for those who depend upon the industries represented here to-day.

NEW PHARMACY REGULATIONS.

A recent presidential decree establishes new pharmacy regulations governing the composition, labeling, sale, etc., of patent and other medicines in Venezuela. Pharmaceutical specialties of a determined formula must bear labels showing the quantity of active substances contained in each dose and the names of these substances. Such preparations will be subject to analysis by the Department of Public Health of Venezuela, and those failing to correspond to the declared formula will be considered fraudulent. The unauthorized use of containers peculiar to food or other medicinal preparations or mineral waters, as well as of labels which are imitations of those on the corresponding genuine products, or which tend to deceive in respect to place of origin, shall also be held to be fraudulent. Poisonous preparations and products must bear labels on which shall appear, on a black background, the word "Veneno" (poison), in white letters not less than 2 centimeters high, together with the customary sign of the skull and crossbones, also in white.—Gaceta Oficial, June 3, 1914.

FOOD IN PACKETS—A PHENOMENAL DEVELOPMENT IN RECENT YEARS—FOOD IN THE BULK ALMOST A THING OF THE PAST.

The impression one gets on entering the grocery department of any large store, that it is possible to obtain the great bulk of our food supplies in packets or tins, is to a very large extent a correct one. Within the past twenty years the amount of food of various kinds done up and placed on the market in packets and tins has increased enormously. It may surprise many, however, to know that in the middle of the eighteenth century even cereal foods in packets were already being used to a considerable extent in Great Britain.

The phenomenal expansion of advertisement in recent years has been the means of establishing the proprietary article as an important factor in the people's food supplies, and, of course, a large proportion of food supplied in packets and tins comes within the category of proprietary. Each manufacturer of a specialty means to make the public conversant with the fact and to realize when it gets his product. Consequently he serves it up in packets or tins, which, of course, bear his name. In this way he certainly secures an advantage as compared with his predecessor, who sold his produce in bulk, and of whose name the consumer was seldom aware.

The more scientific preparation of many articles of food tends to further developments in the trade in food in packets and tins. Even were it possible to estimate the value of the produce packed in the United Kingdom we should still be a long way off the total, for great quantities of food in packets and tins are imported; the United States is a leading exporter. Some of our oversea Dominions, moreover, are making rapid strides in the trade.

Just as it is impossible to estimate the value of the trade, so is it impossible in the space available to detail the various articles of food obtainable in packets and tins. Tea, coffee, cocoa, spices, cereals, salt, fruit, fish; these are but a few in a seemingly endless list. The fact remains, however, that the purchaser has become so accustomed to getting various articles in packets or tins that the variety has ceased to interest, or at least to be fully realized.

On the point of cleanliness the consumer can, in general, rely upon foods in packets or tins being quite satisfactory. Their hygienic status is indeed often one of their chief recommendations. And to-day they are more hygienic than ever before on account of the supersession of hand-packing by mechanical means. As an illustration, the case of tea in packets may be quoted. In one continuous operation the tea is blended, automatically weighed, and packed without being handled once. As with tea so with many other commodities. Of course, there are many more which do not lend themselves to packing by machinery, and which have, therefore, to be handpacked. The conditions under which this is now done would, in the greater number of cases, reassure even the most fastidious. Though the bulk of the packing is done at the factories of the numerous manufacturers, there are now fewer stores of any importance in our leading cities where a very considerable amount of packing is not done.

Many of the commodities sold in packets and tins are also obtainable loose—that is, they are kept in bulk until a buyer places an order. Rolled oats are an

example. With regard to certain commodities, and perhaps more especially certain cereals, there are those who contend that a higher quality is retained in bulk than when done up in small packets. On the other hand, when kept for a long time contamination is more to be feared in bulk than in packets. Again, in regard to certain articles which are put up in tins, the quicker this is done the better. Coffee is an outstanding example; the quicker it is put in sealed tins after roasting the greater the likelihood of its retaining its flavor.

Whether it be best to pack a certain article in packets or tins depends upon the article. Some articles will keep as long as necessary in the ordinary packet, while others keep better in tins. The introduction of mechanical appliances has, of course, reduced manufacturers' expenses. Even in regard to food packed by machinery there is naturally considerable expense to be borne. Per packet or tin it may work out at a very small figure. The masses, however, are aware of the fractional difference in the article sold in packets and that in bulk—it may only amount to $\frac{1}{2}$ d. per two or three lbs. on cereals—and for that reason they adhere to the old fashion of buying at a store which carries a big supply in bulk.

Still, everything considered, the development of the trade in food in packets and tins has given general satisfaction to the consumer. Indeed the contention is frequently made that but for that development the masses at least would to-day still be without many articles of food which they have come to regard as necessary.—*London Times*.

ELECTRICAL SCIENCE.

ROMANCE OF THE ATOMS—TRANSMUTATION OF THE ELEMENTS.

Speaking at Oxford, Sir J. J. Thomson, Cavendish professor of experimental physics at Cambridge, pointed out that the atomic theory, the theory that matter, in spite of its apparent continuity, is in reality made up of a great number of very small particles, is as old as the science of physics itself; but for two thousand years it made no progress because it had no real connection with physical phenomena. No facts were known by which it could be tested, and it was too vague to suggest for itself effects that could be put to the test for experiment. It was sterile because it was divorced from experience, and it affords a striking proof that a theory can grow only by the coöperation of thought and facts. Facts play such a large part in stimulating imagination and suggesting new ideas that every mechanical improvement in apparatus, every new method that makes it easier to investigate physical phenomena, not merely affects the technique of the science, but may originate ideas that will ultimately revolutionize our philosophy of the universe.

In giving an account of the present state of the atomic theory, the lecturer pointed out that we now know that such things as atoms exist, and that the atoms of an element are all of one kind. We know that all atoms contain electrons—minute particles charged with negative electricity—and that there is only one kind of electron; and this knowledge constitutes the first step towards a knowl-

edge of the structure of the atom and towards the goal towards which since the time of Prout many chemists have been striving—the proof that the atoms of the chemical elements are all built up of simpler or “primordial atoms.” The number of electrons in an atom is also known. From measurements of the scattering of Röntgen rays it follows that the number is not very far from half the atomic weight, so that in the carbon atom there would be six electrons, in the oxygen eight, and so on, while in the lightest atom, hydrogen, there is probably only one.

TRANSMUTATION.

The constant difference between the number of electrons in the atom of one element and that in the atom of the element next in the series is strong evidence in favor of the view that the atoms of the consecutive elements differ from each other by the addition of a primordial atom, which is apparently the atom of helium. The atomic weights of the elements show that in their formation a measurable change of mass has taken place, and the changes of energy involved must be enormous compared with those liberated in any chemical changes with which we are acquainted. For instance, the atomic weight of chlorine being 35.5, which is not a whole number, it follows that in the formation of 355 grammes of chlorine there must have been a change of mass of at least half a gramme, and this involves the absorption or liberation of an amount of energy about equal to that required to keep the Mauretania going at full speed a week. The amount of energy required to break up an atom has a very important bearing on the problem of transmuting the elements by physical means, but the lecturer said that his efforts to split up atoms, though he had succeeded in detaching electrons, had not yielded any evidence he could regard as conclusive that by such means the atom of one element could be changed into an atom of a different kind.

WORK FOR FUTURE SCIENTISTS.

As regards the structure of the atom there is strong evidence that the electrons in it are divided into groups and that some of its properties—those associated with its innermost group—are connected in a very simple way with the total number of electrons in the atom; and that there are other properties, notably the chemical ones, which change in a rhythmical way with the atomic weight and which depend on the electrons near the surface of the atom. Lastly, there are regions in the atom, probably the most interesting of all, about which we know little or nothing, the investigation of which will provide work for many generations of physicists, who will assuredly have no reason to be “mournful that no new wonder may betide.”

NATIONAL WHOLESALE DRUGGISTS' ASSOCIATION.

CHARLES A. WEST.

The fortieth annual Convention of the National Wholesale Druggists' Association was held at Indianapolis the week of September 22. President George W. Lattimer presided over the Convention.

The address of the President was replete with wise suggestions of the progress made during the past year and of the probable effect upon the trade of its legislation. He thought that the government had shown great capacity in dealing with the perplexing questions presented to them and in satisfying the people without at the same time imposing burdensome restrictions upon the trade.

He referred to the income-tax as one of the fairest and most just methods of financing the government. He urged the members to endeavor to secure uniformity of legislation between the State and National laws. He commended the Stevens bill, condemned a war tax on patent medicines and predicted that the parcel-post would come into more universal use as people became educated to it.

Acting Secretary Thomas F. Main reported a membership of 262 active and 347 associate members.

Treasurer Strong reported a balance of cash on hand of \$10,789.86.

The various reports presented

were most admirable, showing earnest work on the part of the committee chairmen.

Among those worthy of particular commendation were the reports of the Committee on Legislation, of Adulteration, Proprietary Goods and Credits and Collections, Fire Insurance, and Drug Market. The following gentlemen were elected as officers for the ensuing year:

President, Charles A. West, Massachusetts; Vice Presidents, W. J. Mooney, Indiana; John R. Tague, Tennessee; F. E. Bogart, Michigan; John Phinzy, Georgia; John R. Mason, Texas; Secretary, Thomas F. Main, New York; Treasurer, S. E. Strong, Ohio; Board of Control, Charles Gibson, Charles E. Bidwell, James W. Morrison, and George R. Merrell. F. E. Holliday was selected as the Association's General Representative.

On Tuesday evening the visiting ladies were entertained by Mr. and Mrs. J. K. Lilly with a *musical* at their residence on North Meridian Street. Wednesday evening the Convention were the guests of Eli Lilly & Co., and "a most enjoyable occasion" was the verdict rendered by all. The banquet was held on Thursday evening, at the Claypool Hotel, with Mr. J. K. Lilly as toastmaster of the evening. The speakers were President-elect West, President Lattimer, Governor Ralston, Meredith Nicholson and Rev. F. E. Taylor.

Friday, the Convention members were the guests of Hon. Thomas Taggart, at the French Lick Springs Hotel, and a most bountiful hospitality was extended to the Convention. The beautiful hotel and grounds were thrown wide-open to the visitors and their enjoyment of the occasion was enhanced by their inspection of the plant of the famous Pluto Water.

One of the most pleasant features of the Convention was the dinner of the Past Presidents, at the Claypool, on Monday evening, at which Mr. Thomas F. Main, President of the Association in 1894, presided.

Mr. Charles A. West, the newly-elected President, is Vice President of the Eastern Drug Co. of Boston, Mass. The Association is to be congratulated upon its choice for President. "One of Nature's noblemen," courteous in the highest degree, he will bring to the office of President that earnestness of purpose, courage of conviction, that dignity and courtesy which will stimulate the work of the organization and of every officer and member. The Association has cause for thanksgiving in its selection of Charles A. West for its leader for the coming year, and as the successor of a long line of eminent men of the wholesale branch of the profession.

Of General Interest

UNITED STATES CHAMBER OF COMMERCE TO STUDY FOOD AND DRUG QUESTIONS.

The Chamber of Commerce of the United States of America, widely distributed throughout the United States, has taken up the study of the subject of uniform food and drug regulation. For this purpose a special committee was appointed in July, and its first meeting was held at the headquarters of the Chamber in Washington, October 8th. The committee is composed of W. M. McCormick of Baltimore, A. J. Porter of Niagara Falls, John A. Green of Cleveland, B. L. Murray of New York, and Theodore F. Whitmarsh of New York. Mr. Murray is chemist to Merck & Co., and Mr. Whitmarsh is Vice President of Francis H. Leggett & Co.

The following resolution was adopted:

Resolved, That the Chairman be and he hereby is authorized and empowered to appoint two sub-committees to consider, respectively, the problems relating more particularly to food control and to drug control, and to report their findings to the general committee.

As a result of the above resolution, Mr. McCormick appointed Mr. Murray as Chairman of the Sub-Committee on Drug Control, and Mr. Porter as Chairman of the Sub-Committee on Food Control.

The following resolution, commending the efforts of the Department of Agriculture tending towards coöperation and uniformity, was also adopted:

Resolved, That this committee hereby earnestly and heartily endorses the establishment of the bureau in the United States Department of Agriculture, particularly concerned with Federal and State coöperation in the enforcement of the Food and Drug Control Laws, thereby promoting an equal and uniform enforcement of such laws, believing that this work is distinctly in the public interest.

The position taken by the committee on the meaning of uniformity is interesting and will repay close examination. Its views are not confined to a limited horizon, but are intended to grasp the broader and wider

fields. Its efforts will be confined to no organization or class of people. It hopes to cover in its endeavors the position of the wholesaler, the retailer, the consumer, the manufacturer, the official, and all others concerned in the production, handling and consumption of food and drugs. But only the broad, general questions of national character will be considered. After a lengthy discussion the committee at its meeting, by unanimous vote of all present, adopted the following regarding uniformity:

Uniformity, as the committee would define it, involves the highest degree of efficiency in food and drug control which it is possible to have prevail universally and equally in every part of the nation. The Federal, State, and municipal laws and their regulations would, if perfect uniformity were attainable, reach the level of full and complete efficiency—and thereby afford equal protection and a uniform standard of living for all the people. Uniformity accomplished, places merit and the general public interest over local political or geographical divisions. This committee will, therefore, direct its efforts and consideration toward the accomplishment of uniformity. The committee cannot but feel impressed with the magnitude, the importance, and the seriousness of its work. It cannot but feel the need for the closest study of the subject. And again the committee cannot but feel the necessity for the fullest and most cordial coöperation between itself and the officials and all others concerned. The committee will, of necessity, act deliberately and slowly, making certain of each step, considering only the important problems of national character.

COBBLERS, TO YOUR LASTS!!

To the Editor:—With much interest and appreciation the subscriber read and digested the excellent editorial of the October issue, entitled "The Commercialization of Pharmacy." It is my candid opinion that this editorial voiced the opinion of the great mass of the members of the A. Ph. A. and all of that class of pharmacists who believe in Pharmacy as a profession and who revere and honor those who have made it a scientific calling,—one demanding the highest exercise of application, education and skill.

The Chairman of the Commercial Section, in his address at the Detroit Convention, most

certainly exaggerated the commercial side of pharmacy. It is true that, to some extent, commercialism has a place in pharmacy, as well as in other professions. No pharmacist, no physician, no lawyer and, even, no minister, can be successful, if they neglect the commercial part of their profession. Personally, I cannot agree with the statement of the Chairman of the Commercial Section, that it is equally as "ethical" to sell picture post-cards as it is to compound and dispense prescriptions. Besides that, it is not as profitable to sell a penny-picture card as it is to dispense a prescription at fifty cents!

The average druggist of to-day is too apt to follow the ways pursued by the large chain stores. He thinks that his salvation, especially, lays in the adoption of their methods! From *legitimate* side lines, a great many of the druggists, throughout the United States, have drifted into the sale of articles entirely *foreign* to pharmacy. Pharmacy, nay, the drug business, has walked, *and even run*, a downward path by the sale of such articles as umbrellas, hair goods, eggs, and last, but not least, by the establishment of lunch-counters. The writer was more than surprised to find such lunch-counters in a prominent pharmacy at Nashville, when attending the Convention.

As an example of how the degeneration of pharmacy, is making rapid progress, let me state that one of the chain stores in New York City, displays, very prominently, this sign on the main floor: "Drugs in the Basement!" Such signs and the sale of goods foreign to our business cannot but degrade pharmacy, and will surely deprive us of the little respect which the public has at the present time for our profession.

After all, scientific education is the cornerstone of the whole foundation of professional pharmacy! A pharmacist who has the proper scientific training, and, consequently, the real knowledge will *never* have to stoop to the adoption of side-lines which are foreign to

pharmacy. Owing to his training and his knowledge, he is enabled to make a living and more than a living by practising pharmacy.

The writer does not pretend to be the Moses to whom the Acting Editor refers, but he has preached for years that more professional, and less commercial pharmacy is needed, in order to elevate pharmacy to that position where it properly belongs. Discard your side lines, become an expert in your profession, study the U. S. P. and N. F., make your own preparations, become a prescription specialist, get the reputation of being a skillful pharmacist and last, but not least, gain the confidence of the public as well as of the medical profession!

"Cobbler, stick to your last," is the advice which the Acting Editor gives in the editorial in the October issue of the Journal. Practically the same was voiced by the writer in his address as Chairman of the Section of Practical Pharmacy and Dispensing at the Richmond meeting in 1910 in his advice, "Don't be a jack-of-all-trades, but be a master of a profession, namely 'pharmacy'!"

If pharmacists throughout the country would heed such advice, how much better would that be for pharmacy, and how soon would we have a profession of pharmacy of which the United States could be proud.

OTTO RAUBENHEIMER.

<>

William Henry Lacey, aged 64 years, for many years in business at Nineteenth and Green streets, Philadelphia, died of a complication of diseases on September 30, 1914. The store came under his management in 1873, and his ownership in 1880, and has been one of the land-marks of that section. Mr. Lacey was prominent in several fraternal organizations. He became a member of the American Pharmaceutical Association in 1907. He was unmarried. A brother survives him.

IN AND OUT OF THE INDIAN TOOLHOUSE.

By Clark McAdams.

DR. H. M. WHELPLEY.

I went down into Albion place a few nights ago to see Dr. H. M. Whelpley's collection of Indian relics. It had been some months since I had seen it. I found it growing, as always, and the house stuffed with it until the walls are beginning to bulge. The doctor's father, who was a physician over in Union County, Illinois, where the Indians at Cahokia quarried the flint for their farm implements, laid the foundation of this tremendous collection years ago. He drove about the country in professional quest of ague and measles, and always brought home a relic or so in the back of the buggy. The son began where the father left off, and he has by this time become the foremost private collector in the United States. The only way to keep him from getting anything that strikes his fancy is to nail it down, exactly as Europe did when the late Mr. Morgan went over collecting art and antiques. Collecting is a disease, the germ of which will be discovered in time. It begins mildly, like whooping cough and housemaid's knee, and reduces the patient in its extreme form to a feverish desire to collect something.

Dr. Whelpley brought out his tray of banner stones, and we all began palming them down and caressing them in the way a lover of fine Indian relics will do. I have seen Indian relics take on a fine luster from the affection

borne them by connoisseurs. Banner stones are as a rule made of rose quartz. They are very rare and very beautiful. The butterfly type is as highly prized as anything the aborigines of this valley made. A banner stone had no more practical use than to serve as an ornament, or a ceremonial. It was art, which requires no explanation of what it is for.

When we had seen the banner stones—some \$2000 worth of them—the doctor brought out his cannel coal relics. Cannel coal is bituminous fuel with something of the hardness and brittleness of anthracite. It takes a very fine polish, and in former times all jet ornaments were made of it. The Indians sometimes made something more than a fire of cannel coal. Such relics are rare, but Dr. Whelpley has them. The rarer all relics are, the more he has of them, as a rule. For instance, there was a man in Mississippi County, Arkansas, in prior times, who made a specialty of effigy pottery. He made bowls shaped like a human head with a hole in the top. Some of these heads were elaborately colored. Of the eighteen known in the country, Dr. Whelpley has two. One of these effigy pots is a very striking thing. It looks like an Indian, and was probably a very faithful portrait of the artist's brother.

We were by this time in a rhapsody of appreciation, and the doctor brought out his big hematite ax. This ax came from Calhoun County, Illinois. It is not only big, but perfect. One loving Indian relics, could fondle it as a woman fondles a baby. It is made of native iron unsmelted, and has a groove in it, indicating that the Indian who made it did so with some thought of how he was to get up his winter's wood. Hematite axes are not uncommon in this vicinity. The Indians made many of them in the iron region of Missouri, and they are fairly abundant in all local collections. They are nevertheless prized, and a good one is as likely to start a general war among collectors of Indian relics as one of the Balkan states is to precipitate an all-around fight in Europe.

Some years ago Dr. W. F. Parks, a local collector, was in California. He asked everybody he met for two or three months if he knew where there were any Indian relics, and learned in that way of two osidian ceremonials up in the mountains of the north end of the State. Osidian is the glass made by the heat of volcanoes. It is found in all volcanic countries more or less. Anyway, Dr. Parks was told that these great osidians, which had served as ceremonials in a California tribe for generations, were in the hands of an old Indian woman, who would sell them. Descending down the line, they were in danger of falling into the hands of her nephew, whom she considered a bad Indian. (He was probably a baseball pitcher.) Dr. Parks bought these blades for Dr. Whelpley. A man went up into the mountains and brought them out, and they are in the collection in Albion place. There is nothing like them in any other collection in the world. They are, moreover, undamaged, despite their long and hazardous journey. Ten thousand Indians have made them lustrous with caresses. They glow like the blarney stone.

And to think that the "Seeing St. Louis" automobile does not even pass the house!

Proceedings of the Local Branches

CHICAGO.

The Chicago Branch of the American Pharmaceutical Association held the first monthly meeting for the season of 1914-15 at the University of Illinois School of Pharmacy Building on the evening of October 20th. In the absence of President James H. Wells, Vice-President W. B. Day presided.

The meeting was addressed by Messrs. Bruun, Morrison, Craig, and Potts.

A. Ph. A. activities were discussed by Professor C. M. Snow. He summarized the interesting features of the many and varied sessions at the Convention in a most attractive way, dwelling especially on the U. S. P. and N. F. work.

A Program Committee was appointed, consisting of Messrs. Craig, Gathercoal, and Becker, with instructions to present a summary of the programs for the meetings of the Branch for the coming season.

E. N. GATHERCOAL, Secretary.

CINCINNATI.

Resuming the monthly meetings of the Cincinnati Branch of the A. Ph. A., the first meeting of October 16th proved to be an agreeable surprise. It was preceded by an elaborate luncheon, after which our new President, E. H. Thiesing, delivered a very inspiring address, during which he outlined a vigorous campaign tending for the increased interest of the members to individual efforts, and also promising to present lectures from prominent educators in the Pharmaceutical world.

A short business session followed, during which the minutes of the first annual meeting of the Branch, May 12, 1914, as read by the Secretary, were approved.

President Thiesing then introduced the speaker of the evening, Dr. A. O. Zwick, who chose for his subject.

POISONERS—ANCIENT AND MODERN.

The lecturer delved into ancient history, proving by historical facts, writings, such as the Eber-Papyrus, legends and other means, that the Ancient Hindoos, the Egyptians, the

Romans and others were well versed, not alone in the knowledge of the poisons by themselves, but also in a surprisingly intimate knowledge of preparing these poisons and using same for sinister and unlawful purposes.

Dr. Zwick has the happy faculty of presenting his lectures interspersed with interesting pictures, holding the attention of his auditors, who feel but one regret; that it is over, all too soon.

Dr. Zwick was given a rising vote of thanks.

The meeting was well attended by the members and their wives, and also by a number of guests, students of the Cincinnati College of Pharmacy and the Eclectic Medical College.

The Cincinnati Branch now has a membership of fifty.

The officers for this year are: President, E. H. Thiesing; First Vice President, F. W. Weissmann; Second Vice-President, I. E. Kutchbauch; Treasurer, Julius Greyer; Secretary, Charles A. Apmeyer; Executive Committee, 3 years, Dr. A. O. Zwick; 2 years, C. T. P. Fennel; 1 year, Charles G. Merrell.

CHARLES A. APMEYER, Secretary.

NORTHWESTERN.

The first of a series of winter meetings of the Northwestern Branch of the American Pharmaceutical Association was held at the College of Pharmacy of the University of Minnesota on Wednesday evening, September 30th, beginning at 8 o'clock. The following program was presented:

The Sixty-second Annual Convention of the American Pharmaceutical Association, the American Conference of Pharmaceutical Faculties, and the National Association of Boards of Pharmacy, by Dean F. J. Wulling.

The Sixteenth Annual Convention of the National Association of Retail Druggists, by Mr. Charles H. Huhn.

The U. S. P. and N. F. Propaganda Exhibits at the recent A. Ph. A. and N. A. R. D. Convention, by Prof. E. L. Newcomb.

Experiences in Europe, by Mr. Truman Griffen.

Observations in Europe, by Mr. C. A. Robinson.

The Pharmaceutical Tour of Europe, by Prof. Gustav Bachman.

The latter papers were descriptive of the tour of the German Pharmaceutical Society on the Continent in war-time and were very interesting, being illustrated by means of the Balopticon.

Greetings were received from Mr. A. D. Thompson, President of the Branch, who was unable to attend on account of illness. Upon the suggestion of Dean Wulling the Chair appointed a committee, consisting of Messrs. Frost, Horn, and Parker, to draw up and forward to Mr. Thompson, resolutions expressing our regret of his continued illness and wishing him an early recovery.

Prof. Newcomb described the U. S. P. and N. F. Propaganda Exhibits at Philadelphia and Detroit and stated that more permanent good would come from such exhibits if the number of preparations were limited and the number of different samples of each preparation extended. The interest in the exhibit arranged by the Committee on Pharmacopœias and Formularies confirmed this opinion.

All of the various factors which might cause a variation in the finished product should be demonstrated or exhibited.

EDWIN L. NEWCOMB, Secretary.

PHILADELPHIA.

The first of the regular monthly winter meetings of the Philadelphia Branch of the American Pharmaceutical Association was held on Tuesday evening, October 6th, at the Medico-Chirurgical College. President Cook presided. The minutes of the last meeting were read and approved, as was also the report of the Treasurer. Messrs. J. E. Brewer and J. Atley Dean were unanimously elected to membership in the Branch. Professor J. Edward Brewer was unanimously elected to fill the vacancy caused by the resignation of Secretary-Treasurer R. P. Fischelis.

Professor Cook, in reporting for the Committee on A. Ph. A. Headquarters, stated that this committee had not arrived at any definite plans, owing to the resignation of the Chairman, Howard B. French. It was decided to postpone the appointment of a new Chairman until the next meeting.

The program of the evening consisted of reports of the delegates to the various State and National pharmaceutical meetings held during the summer. The meeting of the American Pharmaceutical Association was interestingly reviewed by Prof. J. W. Sturmer. Mr. Charles Rehfuß gave his impressions of the Philadelphia Convention of the National Association of Retail Druggists, and Dr. R.

P. Fischelis reported the events which took place at the meeting of the Pennsylvania Pharmaceutical Association, held at Buena Vista.

Professor C. H. LaWall gave the monthly summary of current pharmaceutical literature. [Printed on P. 1593.]

The reports of the delegates were discussed by Messrs. F. M. Apple, S. C. Henry and F. E. Stewart.

The next meeting of the Branch will be held on November 3d, and the chief topic for discussion will be the preparations in the new National Formulary.

ROBERT P. FISCHELIS, Secretary.

CITY OF WASHINGTON.

The October meeting was held on the 21st instant, at the National College of Pharmacy, George Washington University, before an unusually large gathering for the first fall meeting.

President Richardson read a report on the annual meeting of the Association and detailed the happenings at Detroit, and their bearing upon pharmacy. Mr. M. I. Wilbert and Dr. S. L. Hilton also spoke on the same subject.

Dr. W. W. Stockberger addressed the meeting on the "Prospects of Commercial Drug Growing in the United States," along the same lines as his address on this subject at Detroit, published in the Journal in last issue.

Unquestionably, Dr. Stockberger's talk was a most able address upon a subject of which he has made a most exhaustive and careful study, and upon which no one else is better versed. He was enthusiastically received and the most careful attention was given to every word he uttered.

HENRY B. FLOYD, Secretary.

ST LOUIS.

The St. Louis Branch held its third Annual Meeting on the evening of October 30, at the College Building. President J. A. Wilkerson presided.

The delegates to the American Pharmaceutical Association meeting, Messrs. G. A.

Burkart and T. C. Hagenow, reported upon their experiences of that meeting.

President Wilkerson, in his retiring address, described the work of the Branch during his administration and made some valuable recommendations as to its future activities.

The following officers were elected: President, Carl T. Buehler; Vice-Presidents, Charles H. Bierman and C. W. Hahn; Secretary, Julius C. Hoester; Treasurer, Theo. C. Hagenow; Advisory Board, Messrs. Wilkerson, Burkart, and Schwerdtmann.

JULIUS C. HOESTER, Secretary.

College and Society

UNIVERSITY OF ILLINOIS SCHOOL OF PHARMACY.

The University of Illinois School of Pharmacy has opened its fifty-fifth session with an enrollment of 200 students, of whom 108 are enrolled in the first year and 92 in the second.

The St. Louis College of Pharmacy celebrated its semi-centennial on the 10th and 11th of this month, and the occasion was one long to be remembered by all those who assisted in the celebration of its "Golden Anniversary."

On Tuesday occurred a reunion of the classes from 9 a. m. to 4 p. m. and a luncheon was served.

The formal exercises were held at the Auditorium of the Central High School at 8 p. m., Tuesday. Addresses were made by Professors Joseph P. Remington, Charles Caspari, Jr., James H. Beal and Frederick J. Wulling, and by Ex-President C. P. Waldbridge and Joseph L. Boehm.

There was a trolley excursion to Shaw's Garden on Wednesday, and at 7 p. m. the anniversary banquet was enjoyed by all in attendance.

The celebration was in charge of a most efficient committee, of which Mr. Fred W. Sultan was Chairman.

ILLINOIS PHARMACEUTICAL ASSOCIATION.

The Proceedings of the thirty-fifth annual meeting of the Illinois Pharmaceutical Association have recently been distributed to the members. President Baum has appointed a political committee auxiliary to the legislative committee and which comprises two druggists from each county in the State, 102 members in all. Plans are now being made for amending the pharmacy law. A meeting of the Executive Committee of the Illinois Pharmaceutical Association will be held in Chicago in November to consider these plans and to take action on other Association matters, including the deciding on the place of the next annual meeting.

At the commencement of the Ateneo Rizal of Manila, P. I., and the anniversary celebration of the founding of that University the honorary degree of *Doctor of Pharmacy* was conferred upon Leon M. Guerrero, and the degree of *Master of Pharmacy* was conferred upon Newton C. Comfort, Ph. G., P. D., Pharmacist, U. S. Public Health Service. Both of these pharmacists so distinguished joined the American Pharmaceutical Association in 1904.

Council Business

A. PH. A. COUNCIL LETTER No. 3.

Philadelphia, October 19, 1914.

To the Members of the Council:—

Motions No. 3 (Authorization of Committee on Publication to Effect a Reorganization and to Systematize its Work), and No. 4 (Election of Members; Applications Nos. 3 to 17, inclusive), have each received a majority of affirmative votes.

The following communication has been received since the issuance of the previous Council Letter:—

Detroit, September 16, 1914.

Members of the Council, American Pharmaceutical Association:—

Gentlemen:—We, the undersigned members of the American Pharmaceutical Association, hereby petition the Council to permit us the

privilege of forming a local branch of the Association, to be known as the Detroit Branch:—John H. Webster, William A. Hall, J. G. Hackney, Oscar W. Gorenflo, Charles F. Mann, Harry B. Mason, Frank G. Ryan, J. M. Francis, Oliver A. Farwell, C. H. Briggs, C. F. Ramsay, W. L. Scoville, H. C. Hamilton, E. M. Houghton, L. B. Hayward, Frank O. Taylor, E. Kimmich, A. Alton Wheeler, Joseph J. Von Koss, O. Ivanoff, A. E. Moyer, C. Killingsworth, R. A. Hugill, Nicholas Drugoncin, H. M. Avery, Willard Ohliger, May E. Strawn, Walter H. Blome, R. E. Bell, F. Nagelvoort, A. E. Mallard, F. W. R. Perry, W. P. Doty, Ernest R. Jones, C. Herbert Boldt, William C. Evans, and Leonard A. Selzter.

Do you favor granting the above petition? It will be known as *Motion No. 5 (Petition to form Detroit Branch, A. Ph. A.)*.

Philip Asher reports that the New Orleans Branch has been discontinued, and there is, therefore, no longer any Council representative from this Branch.

Chairman E. G. Eberle writes that:—

"I am in receipt of a letter from Otto F. Claus and Fred W. Sultan stating that they have examined the books of former Acting General Secretary, Mr. Marshall, and have verified the accounts and vouchers and found same correct."

General Secretary Day writes that:—

"I am in receipt of the Treasurer's bond and continuations from Dr. James H. Beal. I have also received the continuation of bond for the year beginning September 27, 1914, for Treasurer Whelpley from the Fidelity and Deposit Company of Maryland. I have certified to the correctness of the Treasurer's accounts and have started a check to pay the premium on the continuation which must be paid not later than October 27th. I suggest that in the next Council Letter mention should be made of the fact that the Treasurer's bond and the continuations therefore are on file in the office of General Secretary. I will place this bond and the continuations in my box in the deposit vault for safekeeping."

General Secretary Day writes that he has received a reply from Dr. James H. Beal to his letter sending a copy of the resolutions adopted by the Association at its recent meeting relative to Dr. Beal and his services on behalf of the Association. Since the Council adopted these resolutions, as well as the general session of the Association, Dr. Beal's reply to Secretary Day is here given, as follows:—

"I have your favor of September 28th, enclosing copy of resolutions adopted by the A.

Ph. A., at its recent meeting. When opportunity offers, please convey to the Association my sincere appreciation of the sentiments expressed by the resolutions and the assurance of my continued interest in all that relates to the prosperity and progress of the American Pharmaceutical Association."

With reference to proposed A. Ph. A. Exhibit at the Panama-Pacific Exposition (Council Letter No. 2) several communications have been received.

Dr. F. E. Stewart writes (October 5th):—

"This is to acknowledge the reception of the letter by Professor Albert Schneider, Chairman of the A. Ph. A. Exhibit Committee, just received. I now desire to move that the American Pharmaceutical Association instruct the Committee to consult with prominent pharmacists and manufacturers engaged in the practice of the pharmacologic arts, with a view of obtaining the necessary funds required for making an exhibit of the kind described in the outline submitted by the Committee, and contained in the letter now before me. My reasons for the motion will be found in the following explanatory statement.

No one will question that the public health is one of the greatest of our national assets, and that it is to the interest of all concerned that certain classes of the community shall be set aside and protected by legal enactment for the purpose of promoting the general welfare in this regard. Hence, we have the medical and pharmaceutical professions, and medical and pharmaceutical laws for their protection from unfair competition by unlicensed practitioners. Hence, we have also medical and pharmaceutical colleges, boards of examiners, and licenses to practice, professional societies and the press, all of which must be supported either directly or indirectly by the public.

Part of the expense of carrying on the work of the medical and pharmaceutical professions is supported by the professions themselves, the members of which devote a large part of their time to original research, contribution of the results of knowledge and experience to science, and the education of those who are entering the professions, and also those who are engaged in their practice, thus promoting progress in the knowledge of disease and the methods for its prevention and cure.

Of late years, there has been a growing tendency to commercialize both medicine and pharmacy until both professions have lost caste and no longer occupy the high position once held in the estimation of the community. Medicine and pharmacy are mutually dependent. Pharmacy, especially, cannot advance except in so far as drug therapeutics is advanced and promoted. It is therefore of vital interest to the pharmaceutical profession that interest shall be created in drugs as therapeutic agents, and in no better way can

this be done than by constantly bringing to the attention of the medical profession and the public the importance of the United States Pharmacopœia, and the standardization of drugs, chemicals and pharmaceutical preparations, to meet the requirements of a rational drug therapeutics.

The attempt to carry on the pharmaceutical vocation as a purely commercial business, in which the demand for drugs is created by misleading methods of advertising, has resulted most disastrously to the interests of the medical and pharmaceutical professions, and the public health. Pharmacy must be practiced as a professional vocation in which financial gain is made subsidiary to the protection of the public health. On the other hand, financial gain is absolutely necessary for the continuance of pharmaceutical practice, and the business should be made sufficiently remunerative to attract the best brains of the country.

The Panama-Pacific International Exposition offers an opportunity for bringing the American Pharmaceutical Association and the United States Pharmacopœia prominently before the great American public. Owing to the commercialism of pharmacy, the public has lost sight of the true object of pharmaceutical practice. The public is also unacquainted with the amount of knowledge and skill necessary to practice pharmacy in a professional manner. Consequently, it is not generally realized that medicines if prepared in accordance with the standards of the Pharmacopœia should command a price commensurate with the amount of knowledge and skill required. This applies to the medical profession as well as to the public at large. The demands on the part of both are for cheap medicines rather than for standardized medicines.

The production of standardized medicines in turn requires knowledge and skill on the part of those engaged in their preparation and dispensing, whether the vocation is carried on by the retail druggist or the great manufacturing house. This knowledge and skill can only be obtained by the education and training given by our colleges of pharmacy. The amount of money necessary to maintain and foster these educational institutions is more than can be obtained by fees from students. State funds and endowments are necessary for promoting our colleges of pharmacy and such funds cannot be secured unless the public is educated to appreciate this necessity. Therefore, the advantage of bringing before the public exhibitions of the kind now under consideration is apparent.

At the present time, the pharmaceutical profession is threatened with extinction by impractical legislation—legislation largely resulting from suspicion on the part of the public, engendered by dishonest commercialism in pharmaceutical practice. Much of this suspicion can be overcome by persistently bringing before the public in properly displayed

exhibitions the scientific and professional side of the pharmaceutical vocation.

Finally, in no better way can the great commercial houses engaged in this practice of the pharmacologic arts promote their commercial interests than by coöperating with the American Pharmaceutical Association in this presentation. What we need is coöperation between the medical and pharmaceutical professions and the manufacturing houses for the promotion of legitimate pharmaceutical practice and the education of the professions and the public in regard to what is meant by legitimate practice, namely, a practice, which will in truth promote the public health, and protect the sick from dishonest commercial exploitation.

I had in mind these objects when I presented my motion resulting in the appointment of the committee for considering an exhibit by the American Pharmaceutical Association at the Panama-Pacific International Exposition, and I believe that the outline placed before us by Professor Albert Schneider, Chairman of the A. Ph. A. Exposition Committee, is eminently suitable for aiding these objects. Standardization is the keynote to pharmaceutical progress from every possible point of view, Standardization means better drugs, better pharmaceutical preparations, better success on the part of the physician and pharmacist, better public health, better prices for medicines, and a better standing for both medicine and pharmacy in the estimation of the American people.

I, therefore, move that the Committee on the Proposed Exhibit at the Panama-Pacific International Exposition be instructed to consult with the leading pharmacists and manufacturers engaged in the medicinal, chemical and pharmaceutical industries of the country, with the view of determining the extent of coöperation and financial assistance that could be expected of them, the Committee to report to the Council later."

Frederick J. Wulling writes (October 5th) that:—

"Concerning the matter of an exhibit at San Francisco, I have already expressed myself to the Chairman of the Committee and to others that, unless the exhibit can be adequately representative of American pharmacy we should not have any, and that to make the exhibit sufficiently representative would require both more time and more money than we could command. It would be far better to refrain from doing anything in the matter than to install an exhibit that would not be sufficiently inclusive in scope. A floor space of 30 x 21 feet would be entirely too small for a proper exhibit and five thousand dollars estimated as the cost of installation and operation is far too low an estimate

In case the Council decides upon an exhibit, it would be necessary for me to resign from the Committee, as I positively cannot add to my present work."

Under date of October 8th, General Secretary Day expresses the following opinion:—

"With regard to the proposed exhibit at the Panama-Pacific International Exposition, the time is now so short that I do not believe it would be wise of our Association to assume the financial responsibility for making and maintaining such an exhibit. Dr. Schneider estimates the expense at five thousand dollars, which is probably a fairly close estimate. I doubt whether the Association can secure this through personal subscriptions, and if it is not so secured the Association would need to advance this amount from its funds which at the present time it is scarcely in a position to do. Under the circumstances, I believe that the idea of making an exhibit for the Association should be given up."

Albert Schneider submits a second report as Chairman of the A. Ph. A. Exposition Exhibit Committee, stating that:—

"I am submitting a second report as Chairman of the A. Ph. A. Exposition Exhibit Committee. I hope I may be pardoned for submitting a report without consulting with my associates. As stated press of time is my only excuse. If anything is to be done in the way of installing an exhibit it must be done at once. I believe that the recommendations which I am submitting cover the entire situation quite fully and that there is nothing more for me to do until the Council has taken action.

I will endeavor to hold the tentative space reservation in the Liberal Arts Building until the Council may have taken action regarding the proposed exhibit."

The report is as follows:—

Members of the Council, American Pharmaceutical Association:—

Gentlemen:—I note that Prof. E. Fullerton Cook asks to be relieved from serving on the A. Ph. A. Exposition Committee and take it for granted that his request will be granted by the Council. The present committee is, therefore, composed of Dr. F. J. Wulling and myself. Because of the press of time as set forth in my letter of September 26, 1914, I am submitting the following final suggestions on the proposed A. Ph. A. Exposition Exhibit. Although this must be considered in the nature of a minority report I am submitting a copy of this report to Dr. Wulling with the request that he either approve or make such other report as he may deem desirable, and to submit such changes to the Council for action.

I.

STILL EXHIBIT.

1. Complete set of U. S. Pharmacopœias.
2. Foreign Pharmacopœias.

3. Photographs of prominent American Pharmacists.

4. Photographs and Prints illustrating the history of American Pharmacy.

5. Crude and Powdered Vegetable Drugs.

6. Chemicals.

7. Pharmaceuticals.

8. Maps, charts and photographs illustrating the source of American Drugs.

9. Apparatus used in pharmaceutical operations, ancient, colonial and modern.

10. Rare books and prints.

11. Medicaments used by American Indians.

12. Medicaments used by early settlers, etc.

II.

WORKING OR STILL EXHIBIT.

1. Equipment for making chemical tests and assays of U. S. P. drugs and preparations.

2. Equipment for making microscopical analysis of drugs and pharmaceutical preparations.

3. Equipment for bacteriological work, sterilization, etc.

4. Equipment for making physiological assays of drugs and pharmaceutical preparations.

Part II can be made either a working or a still exhibit. The equipment should be complete. As a still exhibit the laboratory equipment should not cost the Association more than \$500.00, my idea being that most of the apparatus should be loaned by colleges and manufacturing houses as suggested in my letter of the 26th of September. Personally, I am in favor of making II a working exhibit to be in full operation during the time of the Exposition. My suggestion is that as much of the exhibit under I and II as may be so secured, be loans by colleges of pharmacy and by manufacturing houses and that such technical assistance as may be required for arranging the exhibits be paid for out of a fund to be secured in a manner to be specified. My suggestion is that the A. Ph. A. indicate the maximum sum that the Association may be willing to subscribe and that the balance be obtained through donations secured from friends of the Association. In order to save time I beg to submit the following recommendations:—

1. That the American Pharmaceutical Association arrange an exhibit to be installed in the Liberal Arts Building of the Panama-Pacific International Exposition to be held in San Francisco, 1915.

2. That the exhibit include parts I and II as above outlined. Part I to be a still exhibit and that part II be a working exhibit to be in full operation during the entire time that the Exposition is open, namely, from February 14, 1915, to December, 1915.

3. That the cost of installing and operating

the exhibits be met by the American Pharmaceutical Association and by private subscriptions.

4. In case it is decided that the cost of installation and operation as suggested under (2) is too great, that both I and II be installed as still exhibits.

5. In case it is decided that the cost of installing an exhibit as indicated in (4) is too great, that an exhibit as outlined under I be installed.

6. In case that it is decided to arrange an exhibit as indicated under 2, 3, 4 or 5, your committee should be authorized to secure the necessary assistance for the purpose of collecting the various parts of such exhibit.

As above stated, press of time in which to arrange an exhibit is my only excuse for submitting the above suggestions without consulting with my associates on the committee.

Yours very truly,

Albert Schneider,

Chairman of A. Ph. A. Exposition Exhibit Committee.

San Francisco, October 8, 1914.

Frederick J. Wulling writes (October 12th) as follows relative to above report:—

"I have just received a letter from Professor Schneider enclosing his final report as Chairman of the Committee to look into the question of a Panama Exhibit. He informs me that he has already sent you the report and asks me to make suggestions or any changes in the report that may occur to me. I will make no changes, but will refer you and the Council to my letter to you of October 5th. The thing to do now is to await the action of the Council."

The question of proposed A. Ph. A. Exhibit at the Panama-Pacific Exposition is before the Council and awaits decision.

Motion No. 6 (Election of Members). The following applications for membership have been received:—

No. 18. William George Beucler, 40th St. and Penn Ave., Pittsburgh, Pa., rec. by F. A. Southard and George F. Payne.

No. 19. Blanche I. Rogers, Solon, Iowa, rec. by Ph. A. Schlumberger and Anna B. Schlumberger.

No. 20. A. Herbert Boldt, 376 Jay Street, Detroit, Mich., rec. by Ernest R. Jones and W. L. Scoville.

No. 21. William C. Evans, 189 E. Grand Blvd., Detroit, Mich., rec. by Ernest R. Jones and Clifton H. Briggs.

No. 22. Rasmus Bartleson, Selby and Western Sts., St. Paul, Minn., rec. by W. A. Frost and F. J. Wulling.

No. 23. James A. Scull, Sergeant 1st Class, Hospital Corps, U. S. A., Fort Meyer, Va., rec. by F. W. Meissner and Wm. B. Day.

J. W. ENGLAND,

Secretary of the Council.

415 N. 33d Street.

COUNCIL LETTER No. 4.

Philadelphia, October 26, 1914.

To the Members of the Council:—

Motions No. 5 (Petition to form Detroit Branch, A. Ph. A.), and No. 6 (Election of Members; Applications Nos. 18 to 23, inclusive), have received a majority of affirmative votes.

The following petition for the creation of the Morgantown, W. Va., Branch of the American Pharmaceutical Association has been received:—

Morgantown, W. Va., October 5, 1914.

Members of the Council, American Pharmaceutical Association:—

Gentlemen:—Earnestly desiring to advance the science and art of Pharmacy and to improve the condition of pharmaceutical practice in West Virginia:—

By stimulating research and the development of improved methods;

By diffusing scientific-technical knowledge;

By fostering sound pharmaceutical education;

By upholding the dignity of pharmacy and demonstrating to the public its importance, and the necessity, as a matter of public safety, of restricting pharmaceutical service to trained pharmacists;

By extending the field of usefulness of the pharmacist to the people;

By promoting the enforcement of due observance of established standards for the identity, purity, and strength of medicines;

By furthering the suppression of empiricism;

By aiding in the regulation of the use of dangerous and habit-forming drugs and in the protection of the public health;

By maintaining respect for ethical standards in the practice of Pharmacy;

By promoting relations of comity and mutual respect between physicians and pharmacists; and in short, in all proper ways to promote the true welfare of pharmacy and pharmacists.

We, the undersigned, realizing the importance and full significance of affiliation with the national organization, do petition the Council of the American Pharmaceutical Association to grant us permission to establish a branch of the Association at Morgantown,

West Virginia, and be it further understood, that each person hereupon attaching his signature, promises to give his hearty support to the branch and to the National Association and to aid in conducting the branch in accordance with the rules and regulations of the American Pharmaceutical Association:—

Morgantown, W. Va.:—W. H. Moore, T. J. Casey, N. J. Hutchins, A. B. Berry, G. H. Dent, W. H. Sturgiss, J. B. Chipley, R. M. Holroyd, E. E. Harris, C. H. Rogers, F. D. Wood, W. H. Schultz, L. C. Sturgiss, W. A. Ream, George W. Melcher, W. L. Hiland, J. C. McVicker.

Fairmount, W. Va.:—R. W. Hall, Homer Hall, S. O. Connell, Glenn B. Hamilton, C. W. Windsor, W. R. Crane.

Pine Grove, W. Va.:—D. F. Morgan.

Hastings, Pa.:—J. J. Easley.

Keysor, W. Va.:—J. S. Bosley.

Jaeger, W. Va.:—Clifford W. Ray.

Richwood, W. Va.:—William Gillespie.

Clarksburg, W. Va.:—F. B. Haymaker.

Huntington, W. Va.:—W. C. Price.

Sutton, W. Va.:—Alfred Walker.

Piedmont, W. Va.:—R. E. Kimmel.

Welch, W. Va.:—B. E. Downs.

Terra Alta, W. Va.:—S. M. Scott, Jr.

Do you favor granting the above petition? It will be known as *Motion No. 7 (Petition to form Morgantown, W. Va., Branch A. Ph. A.)*.

Motion No. 8 (Appropriation of \$1000 for Journal and \$400 for Printing, Postage and Stationery). Moved by W. B. Day, seconded by H. M. Whelpley, that an additional appropriation of \$1000 be made for the Journal and an additional appropriation of \$400 be made for Printing, Postage and Stationery in order to cover the expenses of these items of the budget for the remainder of the present fiscal year. The appropriation has the approval of the Finance Committee.

The following letter has been received:—

Camden, N. J., October 23, 1914.

Members of the Council, American Pharmaceutical Association:—

On behalf of the Committee on Standards for Unofficial Drugs and Chemical Products. I report that monographs have been adopted covering the following:—

Allium	Pimpinella
Flores Verbasci	Potassii Formas
Hydrangea	Quininæ Valeras
Inula	Sodii Formas
Iris	(Strychninæ Valeras
Macis	Thymus
Petroselinum	

These have been sent to the Journal of the

A. Ph. A. for publication in accordance with the action of the Council.

Yours very truly,
George M. Beringer, Chairman.

Motion No. 9 (Election of Members). The following applications for membership have been received:—

No. 24. J. Edward Kimlel, 1018 Glendale Ave., Peoria, Ill., rec. by Ernest C. Marshall and C. H. Packard.

No. 25. Julian Baker Chipley, 108 High St., Morgantown, W. Va., rec. by J. H. Beal and G. D. Beal.

No. 26. Nicholas John Hutchins, 186 Pleasant St., Morgantown, W. Va., rec. by Charles H. Rogers and J. H. Beal.

No. 27. Alonzo Brun Berry, 186 Pleasant St., Morgantown, W. Va., rec. by Charles H. Rogers and J. H. Beal.

No. 28. W. H. Moore, cor. High and Pleasant St., Morgantown, W. Va., rec. by J. H. Beal and J. W. England.

No. 29. William Arthur Ream, 304 High St., Morgantown, W. Va., rec. by Charles H. Rogers and J. H. Beal.

No. 30. Frank Davidson Wood, 202 Front St., Morgantown, W. Va., rec. by Charles H. Rogers and J. H. Beal.

J. W. ENGLAND,
Secretary of the Council.

<>

COUNCIL LETTER No. 5.

Philadelphia, Pa., November 4, 1914.

To the Members of the Council:

Motions No. 7 (Petition to form Morgantown, W. Va., Branch, A. Ph. A.), No. 8 (Appropriation of \$1000 for Journal and \$400 for Printing, Postage and Stationery) and No. 9 (Election of Members; Application Nos. 24 to 30 inclusive) have each received a majority of affirmative votes.

Albert Schneider writes that:—

"At a recent meeting of the San Francisco Branch of the American Pharmaceutical Association a local committee was appointed and the writer was made temporary Local Secretary. A special meeting of the local committee was held this A. M. at the California College of Pharmacy. The local committee recommends that the time of holding the sixty-third annual meeting of the American Pharmaceutical Association be set for the week of August 9 to 14, 1915, inclusive.

This recommendation is made after a consultation with Prof. James Barr, Director of Conventions and Societies of the Panama-Pacific International Exposition, who states that the time recommended is favorable to the

unhindered use of the Exposition Memorial Auditorium, one of the buildings of the San Francisco Civic Center, located in the heart of the city and within easy reach of all of the main hotels.

The committee further recommends that the program for the 1915 meeting of the A. Ph. A. be so arranged that the business meetings do not interfere with the entertainments."

Professor Schneider moves that the time of holding the sixty-third annual meeting as recommended above be adopted.

Before this motion is voted upon, it should be stated that the following communication, dated October 28th, has been received by the Secretary from M. I. Wilbert:—

"I had expected to call on you during my recent stay in Philadelphia for the purpose of discussing with you the possibility of a more or less concerted agitation to hold the next meeting of the American Pharmaceutical Association immediately before or after the meeting of the American Medical Association which is also to be held in San Francisco. The American Medical Association is to meet June 21-25, and if it were possible to hold the meeting of the American Pharmaceutical Association either the week before or the week after this date, I am sure that it would be appreciated by many of our members who usually make an effort to attend both meetings. So far as the Section on Pharmacology and Therapeutics is concerned, there is some doubt at the present time as to whether or not this section will develop a program for next year, but in the event that it does, I am sure that the Section would be greatly benefited by having the meeting of the American Pharmaceutical Association held at about the same time, and conversely, the American Pharmaceutical Association would be benefited by the double attraction, which would be an added incentive for members of both Associations to undertake the trip to the Pacific Coast. At all events, there can be no harm in suggesting the proposition for further consideration."

A copy of Mr. Wilbert's letter was sent to Prof. Schneider (on 29th inst.) but he has not had time to receive and reply to the same, so action on his motion will be deferred, for the present.

The question of proposed exhibit at the Panama-Pacific International Exposition is still pending. Dr. Stewart's motion that the Committee on the Proposed Exhibit at the Panama-Pacific International Exposition be instructed to consult with the leading pharmacists and manufacturers engaged in the medicinal, chemical and pharmaceutical industries of the country, with the view of determining the extent of coöperation and

financial assistance that could be expected of them, has not been acted upon by the Council.

In the meanwhile, the following letter under date of October 24, 1914, has been received from Fred. I. Lackenbach, of San Francisco, a copy of which has been sent to Local Secretary protem Schneider:—

"In the matter of the proposed exhibit of pharmaceutical products and processes at the Palace of Liberal Arts, Panama-Pacific International Exposition, I would respectfully advise that April last some forty letters were sent out to all the large pharmaceutical and chemical houses in the United States and abroad with a view of interesting them in the matter of exhibits in the Palace of Liberal Arts. The enclosed correspondence shows the result of this effort.

The main reason for the lack of interest is the fact that only a small proportion of the visitors to the Exposition would be interested in such exhibits. They would be of interest only to the professions of pharmacy and medicine. The cost of maintenance over so long a period would be out of all proportion to the benefits to be derived.

As you no doubt know, the American Medical Association is to meet in San Francisco next year and it is planned to make the 1915 Scientific and commercial exhibit the most elaborate in the Association's history.

It would seem to me much more to the point for the A. Ph. A. to interest itself in the scientific exhibit of the A. M. A. Commercial houses would readily coöperate in such a plan and very likely the materials prepared for exhibition purposes could be used also during the convention of the American Pharmaceutical Association."

No letters from manufacturing houses were enclosed with Mr. Lackenbach's letter, the only reference thereto being in a letter to James A. Barr, Director of Congresses, by Mr. Lackenbach, saying that "the returns on the letters sent out on the matter of exhibits are not at all reassuring, the only favorable response being from the Cutter Laboratory at Berkeley, Cal., which stated that they had reservations on file."

The following letter (October 21st, 1914) to Mr. Lackenbach from Will C. Braun, Advertising Manager of the American Medical Association, is given:—

"Your esteemed favor of October 18, 1914, is at hand. Dr. Jones will be in Chicago the latter part of this week and I will talk the matter over with him regarding exhibits. Then when I come to San Francisco to make definite arrangements, I will get in touch with you. In fact, I am counting on your coöperation in making the San Francisco

Commercial Exhibit of the A. M. A. one of the greatest successes we have ever had in that line."

If the exhibit of the A. M. A. at San Francisco should be held, not only during the week of the A. M. A. Convention, but also during the week of the A. Ph. A. Convention, it would seem to be the logical thing for the A. Ph. A.—if it is decided to have an exhibit—to endeavor to coöperate with the A. M. A., and minimize the expense of the exhibit. This suggestion has been made to Professor Schneider, but he has not had time to reply to it.

Motion No. 10 (Election of Members). You are requested to vote on the following applications for membership:—

No. 31. William Henry Schultz, 128 Willey St., Morgantown, W. Va., rec. by Charles H. Rogers and J. H. Beal.

No. 32. Robert McFerrin Holroyd, 92 Beverly Ave., Morgantown, W. Va., rec. by Charles H. Rogers and J. H. Beal.

No. 33. Gaylord Hess Dent, 130 Fayette St., Morgantown, W. Va., rec. by Charles H. Rogers and J. H. Beal.

No. 34. George Melcher, Willey St., Morgantown, W. Va., rec. by Charles H. Rogers and J. H. Beal.

No. 35. Clifford W. Ray, Jaeger, W. Va., rec. by Charles H. Rogers and J. H. Beal.

No. 36. Gabriel J. Fajardo, 128 Water St., New York, N. Y., rec. by Jose P. Alacan and Jose Guillermo Diaz.

J. W. ENGLAND,
Secretary of the Council.

HISTORY OF THE AMERICAN PHARMACEUTICAL ASSOCIATION. SECOND DECADE—1860-1870.

WILLIAM C. ALPERS, SC. D.

The second decade of the American Pharmaceutical Association began under the most trying and discouraging conditions. The Civil War had rent our great country asunder and men who a year before parted as friends were now ready to fight each other on the bloody field of battle. Business was demoralized and the hearts of many, even the bravest, were filled with anguish and apprehension for the future.

The tenth annual meeting, which should have been held at St. Louis, was abandoned, but the following year in 1862, the old guard of the Association, mostly its founders, convened at Philadelphia, Henry T. Kiersted, of New York, presiding in the first part, and William Procter, Jr., of Philadelphia, in the second part of the meeting. In his address Mr. Kiersted says:

"Yet, discouraging as the prospect is, and crippled as we are in the compulsory absence of so many of our associates, your Executive Committee had determined that we should yield no longer to the blast. One annual meeting has been omitted; our duty to ourselves, to the profession, and to the community summons us once more to the work."

The attendance was naturally small, only twenty-four being present at the roll call, but these were joined by seventeen more in the course of the meeting. Many were the letters of regret from the friends of Pharmacy, some being unable to attend owing to heavy loss through the inclemency of the times, others having been deprived of their sons and assistants on account of the War, and some had gone themselves to offer their lives for their country.

There was a spirit of sadness and gloom over this meeting, for timid hearts feared that it might be the last of the Association. Many other associations had disbanded, social, scientific and commercial ones, owing to the severity of the times

and it speaks well for the determined spirit of the founders of the Pharmaceutical Association that, in spite of all the gloomy surroundings, they found time and courage to assemble. Another trait that was observable was that no word of complaint was uttered against those who had formerly met with them. It was President Kiersted who, two years ago, had expressed the hope that the threatening clouds might pass by. Now he mentions the fact, "that many of ourselves should soon be personally enrolled in vast hostile armaments, whose every movement should carry death and desolation into regions then smiling with plenty and happy in peace; that the arcana of our own science, consecrated, as it is, to the cause of humanity and to the preservation of health and life should soon be explored to furnish some means of destruction hitherto unknown to the art of war." And from the report of the Executive Committee, the following quotation might be made:

"Joseph Laidley, it will be remembered, attended our last meeting at New York, and was one of the very few Southern members there present. Mr. Laidley was of Irish descent, and was educated in Philadelphia, where he resided until he attained his majority. Having graduated at the College of Pharmacy in Philadelphia in 1850, he soon afterwards moved to Richmond, Va., where he continued to reside until his death in May, 1861, which occurred in a shocking manner, from the premature explosion of a quantity of fulminating mercury, in the preparation of which he voluntarily engaged for the Confederate authorities. Mr. Laidley was formerly an active member of this Association and in 1854-5, was one of its Vice-Presidents. As a pharmacist he was able and energetic and has left on record several papers and essays."

You will see that there was no harsh criticism, no sign of anger against the members who had considered it their duty to fight for the cause of the South; there was nothing but friendship and brotherly feeling. And another quotation from the same report says:

"Charles A. Junghanns, attended our last meeting, having recently before visited his friends in Germany. He was an earnest man, and as a pharmacist stood well with his brethren. When the dark cloud of disunion first threatened the West, Junghanns raised a company in Cincinnati, and as its Captain joined the army of Buell. Naturally not robust, the exposure incident to his new life, affected his lungs. At the battle of Shiloh, his loss of voice having rendered him unable to perform his duty as an officer, he deliberately put his first Lieutenant in command of his company, and taking a rifle fought with great coolness and decision, until he fell from a wound in his head. Mr. Junghanns was an advocate of pharmaceutical education, and in his death our Association has lost a valuable member."

Here we have a brother pharmacist who gave his life willingly for his country. He was one of the many heroes whose names history does not recount, who did his duty without complaint, without hope of reward, without flourish of trumpet, or limelight exhibition. He went, he fought, he died. Can there be anything nobler and finer as a testimonial than the few simple words written probably by Mr. Procter, President of the Committee? Neither great monuments nor flowery speech could do more to show the spirit of devotion and patriotism that prevailed among the pharmacists of those days.

The meeting itself moved in a quiet, mostly scientific way. There were a great many queries, these having accumulated for two years, and many interesting papers were read. It is to be remembered particularly that Professor Maisch at that time emphasized the idea to encourage the wine growers of the United States to save the tartar deposits. We quote him as follows:

"*Resolved*, That we regard the production of tartar from American wine of great importance, on account of the extensive uses in which that product is applied in Pharmacy, domestic economy and the arts; that we believe that crude tartar and purified (cream of)

tartar will always meet with a ready sale, and that the wine growers will advance their own interests and assist in developing the resources of American agriculture, by making the experiment of saving the tartar."

In this one advice, as well as in many others, we see the national spirit trying to encourage domestic industry and enterprise.

Up to this time there had always been a Committee on Adulteration, and it was moved at this meeting, by Dr. Squibb, to discontinue this committee and appoint in its place a committee of five to be called the Committee on Drug Market.

"Resolved, That the Committee on Adulteration be discontinued, and a committee of five be appointed to be called the Committee on the Drug Market, whose duty it shall be to report annually the fluctuations in the supply and demand of drugs, the variations in quality, and adulterations and sophistications coming under their observation, or reported to them by others; and that they be authorized to make a report on any adulterations and sophistications of immediate interest, through the pharmaceutical journals, as soon as practicable after their discovery; and that all members are requested to furnish information of the kind required, without unnecessary delay."

The larger part of the proceedings, was made up of the report of the Progress of Pharmacy, which, owing to the lapse of two years, contained a great deal of interesting and valuable information. It treated particularly of pharmaceutical preparations, materia medica and subjects of historical value; for while most of the investigations and recommendations contained therein have now become familiar facts and rules in Pharmacy, they yet show that, in a great many instances of important chemical and pharmaceutical developments, the first instigation came from the American Pharmaceutical Association.

In spite of the small attendance and the discouraging outlook under which the Association assembled, the spirit for the elevation of Pharmacy and purity in actions and deeds, remained undaunted, as can be seen by the expulsion of a member of the Association, Mr. Hunewell, of Boston. He had used the title and seal of the Association for improper advertising purposes. An effort of this ex-member to be reinstated in 1867 failed, the Association refusing to re-open the case. This is the first expulsion of any member from the American Pharmaceutical Association. The meeting adjourned to meet again in Baltimore, under the presidency of William Procter, Jr.

At the meeting in Baltimore in 1863, there were forty-nine members present. The address of the president was made in a quiet, sober and business like tone. He forecasts a financial difficulty that he thought would befall the Association. According to the Constitution, members who had paid their dues for ten years, became life members and were exempt from further payments. Mr. Procter pointed out that, in a year or two, most of the active members would, according to this clause, cease to pay, and as the increase in membership, owing to political difficulties was not very great, he feared that the Association was approaching financial bankruptcy. This question gave rise to a number of debates in this and following meetings: The president proposed that a life member should pay \$1.00 annually; others proposed that they should pay the cost of the proceedings and so on, but nothing definite was done in this matter for a number of years.

Mr. Procter's remarks on the Pharmacopœia were of particular interest as they show of how little account this valuable book was held at that time. He says:

"It is time that our practitioners of Pharmacy of every grade should know that we have a United States Pharmacopœia, by personal inspection. Hundreds, perhaps thousands, have

never seen the work and know it only through the several commentaries and more particularly that in the U. S. Dispensary, which work is often confounded with the Pharmacopœia."

Before closing this address, he says further :

"I would fain re-impress on you, fellow members, the need we have of more earnestness—I might say enthusiasm—in order to carry forward the several objects of our association with zeal and success. Already our national Association, through the proceedings and manner of organization, is attracting notice abroad, and our co-laborers there are looking to us for fruits proportioned to the profession we make. Let us then individually interest ourselves in the work of progress—each in his own way; and by well directed efforts at home, among our fellow pharmacutists let us increase our members so as eventually, if possible to include all the better qualified and liberally disposed pharmacutists and druggists in the whole country. That our Association has been able to keep up its organization, in the face of the discouraging circumstances which now surround it, is to me, gentlemen, a strong evidence of its vitality, and leads to the assurance that when peace once more smiles upon us, our Society will, with a due amount of esprit de corps, become an honor to American pharmacutists, and command the respect of our brethren everywhere."

Acting on the recommendation of the president, in reference to the Pharmacopœia, resolutions were afterwards proposed by Dr. Squibb, and also by Mr. Parrish, recommending the use and study of the Pharmacopœia to pharmacutists and physicians and establishing a permanent committee on the Pharmacopœia, consisting of three members, to keep a current commentary on the Pharmacopœia and a record of all useful criticisms and suggestions. The president appointed for such a committee, Dr. Squibb, William Procter, Jr., and Alfred B. Taylor, probably the ablest men who could be found for this purpose in the Association.

Among the queries and articles presented to the Association we notice a great many in which the desire is expressed to develop the cultivation and exploitation of indigenous plants for pharmaceutical purposes. Of interest is also the thirtieth query: "What course should be adopted by Pharmacutists in view of the present state of the liquor market, as regards factitious Brandies and Wines?" It will therefore be seen that this vexed question, that agitates us still to-day, is as old as the Association.

The Association at that time was aware of its important influence and at the time entertained a friendly spirit for our co-workers in other countries, as seen by the resolution offered by Mr. Parrish, which is well worth producing at the present time; and is as follows:

"WHEREAS, The mutual cultivation of science tends to break down sectional and national distinctions, and to unite all of kindred objects and pursuits in a common bond of friendship and good will, and whereas, we have learned with satisfaction of the Druggists and Chemists of Great Britain having been summoned near the same time as our present meeting, and as we believe for purposes similar to our own; therefore,

"Resolved, That we view this movement on the part of our brethren of the mother country with feelings of satisfaction and encouragement, and invite their friendly coöperation and correspondence in advancing a knowledge of the science and the art of Pharmacy, and in promoting the elevation of the profession to a position commensurate with the importance and dignity of its objects.

"Resolved, That a copy of these resolutions, signed by the proper officers of the Association, be transmitted to the President of said Conference of Druggists and Chemists of Great Britain by our corresponding secretary, who is also directed to solicit an exchange of their published proceedings for those issued by this Association."

From the Report on the Progress of Pharmacy, we learn that of all the pharmaceutical journals that had existed in the United States before the beginning of the Civil War, only two had been able to survive, namely the American Journal of Pharmacy and the American Druggists Circular. All others had succumbed. A

timid effort is made in the report to condemn proprietary medicines, although no action was taken. The Committee says:

"Several of our German contemporaries have undertaken the task to clear up the mysteries or mystifications of some proprietary medicines sold in Germany and elsewhere at extravagant rates, to the great detriment of legitimate pharmacy. An undertaking of this kind in our country might be attended with benefit; at the same time, however, it is to be feared, that the very opposite of the interests of science and humanity, would almost to a certainty be the gainers, as it would only add to their notoriety."

Of considerable interest are some data given in the report of the Committee on the Drug Market, that had been created the previous year, and presented its first report. It gives us some idea of the value of the drugs in those days, for instance:

"Alcohol: Among the articles of primary importance which have fluctuated largely in price, alcohol holds a prominent place. Of the various grades of alcohol, that called 95 percent, or the *Alcohol Fortius* of the present Pharmacopœia, may be taken to represent the whole. At the commencement of the Association's year, namely September, 1862, it sold at 65 cents per gallon. From this it rose, with occasional fluctuations, during the remainder of 1862 to 81 cents, being once as high as 90 cents. By the end of January, however, it reached \$1.10, and early in February, brought \$1.25. Thence it gradually declined to 95 cents without much fluctuation till the present time, when it varies with the price of whiskey, between 90 cents and 95 cents."

"Ether: The price paid for ether varied from 35 cents to 37 cents, at one time being as high as 68 cents, there being no relation whatsoever between the price and quality, nor even between the price and strength."

"Chloroform: Ten specimens were examined. Nine of the ten were of full official density, and, judging from the bottle, label and quality, seven of these were from the same manufactory. Not one of the ten was up to the standard, in freedom from foreign compounds, though five of them were so nearly up to it as to be considered very good chloroform. The remainder were less clean though, with one exception, not very unclean. One specimen was very bad, unfit even for external use. The price paid for these were 90 cents to \$1.50 per pound."

Most interesting is the report on Tincture Opii, which says:

"An accurate morphia assay is, however, one of the most difficult in the whole domain of ordinary chemical research, requiring more time and skill than was at the command of the Committee. It was therefore determined, by experiment, that a uniform process for precipitating all the alkaloids could be adopted and relied upon, as giving a tolerably close comparison of the narcotic value of the specimens to which it was applied. Fifty cubic centimeters of the Standard Tincture of the Pharmacopœia, yielded 0.604 grammes of mixed alkaloids by the process adopted. Eleven specimens treated precisely in the same way gave the following results, namely: .424, .327, .343, .308, .486, .427, .480, .427, .340, .338, and .357. These figures indicate that one of the specimens is just about half strength. Five are in the neighborhood of 7-12, and the remaining five between eight and ten-twelfths of the official strength. These preparations cost 1.00, 1.00, 1.12, 1.00, .88, 1.06, unknown, unknown, 1.12, and 1.00 per pound."

"Opium, by the case, in the hands of the importers, has brought an average price of, at least, \$8.50 per pound throughout the past year, and this opium in drying loses an average of 20 percent. in weight and there are about 14½ troy ounces in the avoirdupois pound, while each pound of the official Tincture represents 1¼ troy ounces of the dried and powdered opium. Therefore, at the net case price of opium, the quantity represented in a pound of properly-made tincture costs over one dollar. Now, upon the theory that the druggists are generally honest, and are selling their tinctures below net cost of the principal ingredients, regardless of the cost of menstruum, time, labor and general expenses—to say nothing of profits—this preparation may be all right, if the above examination be all wrong. But if this theory be too absurd for general credence, then these druggists and pharmacutists are chargeable in their practice with an amount of dishonesty which, in the shape of a more bold and manly variety of robbery, would be likely to restrict their opportunities of wrongdoing to the narrower sphere of the criminal prisons."

Among the papers presented at this meeting, were two of particular interest, both treating of a still for apothecaries. One was presented by William Procter, Jr., and the other by Thomas Wiegand. Cuts for stills, as they proposed them, were given and we notice that these identical cuts are still used to-day in the various books on pharmacy. The most interesting paper of the meeting, was furnished by Mr. Procter on Fluid-extracts. In a most exhaustive and scientific

way, he again goes over the subjects as he did some years ago. But instead of treating all drugs alike as he did in his essay in 1859, he now divides them into four classes, as follows:

Class I. Alcohol Fluid Extracts, with a number of sub-divisions according to the strength of alcohol of the menstruum.

Class II. Acetic Fluid Extracts, menstruum diluted alcohol, or alcohol, with a portion of acetic acid intended partly for preservation, but mainly for retaining important volatile ingredients.

Class III. Saccharine Fluid Extracts; these fluid extracts are prepared with water or diluted alcohol as a menstruum; but little if any of the alcohol is retained in the preparation when finished, which is preserved by the agency of sugar; also having a number of sub-divisions, according to the strength of the menstruum.

Class IV. Various unclassified fluid extracts.

The paper is too long for reproduction in *toto*, but it would be well worth while for a historian to collect all the various papers on fluid extracts and combine them into a history of these important preparations.

Other papers of interest were, "On the Internal Revenue" by Edward Parrish. Owing to the difficulty of raising revenue, new laws of various kinds were repeatedly passed by Congress, and Mr. Parrish gives some interesting advice and consideration which our law-makers of today might do well to heed.

Frederick Stearns presented a paper on æsthetical pharmacy in which he makes a plea for more accuracy and neatness in the fixtures and arrangement of the stock in the pharmacies of those days. The volume closes with one of the nicest little papers ever written, called a "Plea for the Handmaiden," by Mr. Parrish, in which he compares pharmacy and medicine, and comes out in sweet, gentle and yet strong words for the recognition of Pharmacy as a profession. He closes with the words:

"Let me not be charged with hostility to the medical profession. My earliest recollections and life-long associations have taught me to love and honor the high-minded physician who, with zeal for both science and humanity, devoted his life to the most laborious and responsible of pursuits; but this very respect for the physician as he *should* be, induces me to place a proper estimate upon the Physician as he *often is*, and to protest, in the name of common honesty and fair dealing, against the unprofessional favoritism to which I have alluded, as being notorious, especially in our large cities. And now, entering into the second decade in the history of this Association, let us assert for American Pharmacy the claim, founded on a common origin and kindred objects, but as a modest and docile sister to a place beside the numerous and distinguished branches of the medical family. May we all strive to deserve such a position."

The observant reader of this volume of the Proceedings, in which two of the most prominent teachers of pharmacy in those days, William Procter, Jr., and Edward Parrish, presented a number of papers, cannot but notice the difference of style and expression between these two men. Procter is always quiet, calm and sober. He thinks clearly and sharply, and expresses his thoughts in a simple but convincing manner. Parrish, the greater scholar of the two, and a great reader of history and poetry, likes to use flowery and elegant language; and particularly when his heart enters into the argument, as in the last mentioned article of the Handmaiden, he seems to rise to higher spheres, and his language flows like a refreshing, rippling stream among the fragrant flowers of the forest.

Mr. J. Faris Moore, of Baltimore, was elected to preside over the next meeting of the Association, appointed to be held in Cincinnati, in 1864.

The twelfth annual meeting of the Association convened in Cincinnati, Ohio, 1864, and was in more than one respect, a continuation of the preceding one. There

was the same spirit of apprehension and uncertainty, although hopeful signs had already appeared on the horizon. At the opening of the meeting there were twenty-five members present, and a few more arrived later. A few of the leading men of the Association had died during the year, the principal ones being Franklin Bache, of Philadelphia; John Meekim, of New York, one of the earlier presidents of the Association, and George W. Weyman, of Pittsburgh, Pa.

In the nomination of candidates for the presidency, a small change was instituted by nominating three presidents, the reason being, to do away with the precedent of electing a president from the city in which the Association was to meet, as it might happen that such a course would be inexpedient, and, besides, would always exclude worthy members from being candidates from towns where the Association would not be likely to assemble. In spite of this change, however, the habit of electing a president from the place of meeting continued for a number of years. At Cincinnati W. J. M. Gordon was elected president for the following year.

A great deal of the time of the twelfth meeting was taken up with the discussion of certain changes in the Constitution, the principal one being the permanent election of the Recording Secretary with an annual salary of \$100.00, and his traveling expenses. This innovation caused a great deal of opposition in the beginning, but it was adopted subsequently. Another vexing question was that of admission of new members. There were at that time the names of many men on the roster who had never signed the Constitution and had never paid dues, and it was pointed out that in the selection of new members greater care should be exercised and no one should be considered a member and receive the proceedings, unless he had paid the dues and signed the Constitution. This question occupied the attention of the Association for many years afterwards. Another change of the Constitution was the creation or the establishment of five standing committees, elected annually, instead of two as before, the five committees being, the Executive Committee, the Committee on Progress of Pharmacy, Committee on Drug Market, each to consist of five members, Committee on Scientific Queries and a Business Committee, each to consist of three members. These resolutions were also adopted at the following meeting, so that the Constitution after the thirteenth meeting contained considerable changes from the original draft.

The report of the Committee on the Progress on Pharmacy contained some information of great interest on the education of the young pharmacutists in various countries and a comparison was made between education in these countries and the total absence of any rules or regulations in this respect in our country. Strong recommendations were made to use all possible means of bringing about a better education of the apprentice.

The Committee on Drug Market brought in a report that filled more than twenty pages of the proceedings and which contained accounts and complete price lists of various drugs. Owing to the political difficulties, it can be understood that the cost of some of the drugs had risen to an enormous price, we notice for instance that morphine sulphate cost \$11.00 an ounce, potassium iodide \$7.00 per pound, quinine sulphate \$3.55 per ounce, glycerine \$1.75 per pound for the English, and, for the American, .75 to \$1.50 per pound. The report, written probably by the Chairman, Mr. Maisch, again makes a strong plea for the cultiva-

tion of indigenous plants and the promotion of domestic industry in pharmaceutical and chemical matters. It says:

"Another important and extremely interesting feature, that might be embraced in one of these reports, is the actual supply to our various markets of indigenous plants and drugs. We ought to regard this in connection with the source of this supply as of the utmost importance in order to prevent, if possible, the extermination of medicinal plants in certain localities. We are in the habit of denouncing the short-sightedness of the governments and the population of the South American republics in felling the cinchona trees, for the purpose of obtaining their valuable bark, instead of carefully nursing them, with the view of preserving them until they have yielded the indispensable drug to their utmost capacity; we applaud the Dutch and English governments for their well directed efforts to transplant the cinchonas to the congenial climate of the East Indies, because we hope that if successful, the calamity of an insufficient supply of cinchona bark will be prevented. And yet what are we doing at home? The writer knows that in years gone by, spigelia, senega, serpentaria, ginseng, and probably other drugs used to be collected in the East, but have become almost completely extinct there, so that we had been compelled to look to the South for a sufficient supply, and, since this source has been shut off, to the young and growing states of our great West. It is within the writer's knowledge that, in certain localities in the immediate neighborhood of Philadelphia, cimicifuga, sanguinaria and veratrum viride have almost or entirely disappeared, and it is likely to be so in other places.

"In view of the growing importance of these drugs, does it not become us to pause and reflect upon proper means to be adopted to prevent their complete eradication? Is it perhaps not similar with podophyllum, the use of which appears to have largely increased in late years? With a soil adapted to as large a number of vegetable species as can be found anywhere throughout the world; with a climate reaching almost to the tropics of the South, and extending through the entire fertile part of the temperate zone; with a continent stretching from the shores of the Atlantic to the coast of the great Pacific Ocean, and embracing towering mountains, undulating hills and large plains; we ought never to come under the necessity of seeing our own medicinal plants transferred to other continents in order to prevent an exhaustion of supply."

If we turn to the scientific papers presented at this meeting, we find the first paper presented by our old and highly respected member, C. Lewis Diehl, at that time from New York, on *Oleum Aethereum*. He had joined in the year 1863, as well as another old and highly respected member now deceased, namely, Albert E. Ebert, of Chicago.

Among the papers presented the one by Mr. Gordon, of Cincinnati, on Glycerin, deserves notice. Glycerin was at that time a new article, and Gordon speaks of "its mission as a remedy, as an adjuvant and as a solvent." His paper was in those days a revelation to most of the hearers. Another subject that was new to most of those present was that entitled "Remarks on Dialysis," by William Procter, Jr. While the investigations of both these men, and the information that they gave in their respective subjects, are now common knowledge to every chemist and pharmacist, the appearance of these two papers at this time shows of what strict and keen scientific spirit the early leaders of our Association were possessed and how nothing escaped them that seemed to be of any use or value in their profession. Mr. E. Parrish read a volunteer paper on the "Systematic Course of Study and Manipulation for Students of Pharmacy." He gives in it a complete syllabus for students and pleads in a masterful way for higher education.

The thirteenth meeting of the Association was held in September, 1865, in Boston, and was called to order by Mr. Gordon, of Cincinnati. At this meeting over one hundred members were present and a livelier and more animated spirit seemed to prevail. It certainly was one of the most interesting and spirited meetings, in so far as a full exchange of opinions on many subjects took place, in which the leading men of those days often differed. It is natural that the president should make some reference to the close of the destructive war. He says:

"As members of a scientific Association, having for its main object the advancement of the members of our calling in elevating and useful knowledge, we have as a matter of course nothing whatever to do with politics; our boast is that we meet on the common ground of a brotherhood which interferes not with the religion or politics of any of the members. We feel, therefore, that we have nothing to do as a Convention, assembled for such purposes as I have indicated, with the war (which is now happily closed), other than to deplore its necessity, to mourn over the separation it has caused us for the time being, from many of our brethren; to regret the hindrance it has been to the advancement of our cause, and to rejoice (which we heartily do), in its termination. Many of our members, particularly in the Southern States, have been practically cut off from connection with our Association during the last four years, and their vacant places have been the cause of no little sorrow for those of us who were enabled to meet. I think I express the sentiments of every member of the Association, now met in our annual conclave, when I say that our doors stand open to all those who have been hindered from meeting with us, and a hearty welcome awaits them."

The president also dwells on the many taxes that had been levied during the war and which brought about an increase in the prices of many pharmaceutical and chemical preparations, and he there makes his first plea for free alcohol used as a medicine and in the arts. After nearly fifty years of agitation this same desire still exists.

At this meeting the first mention of an International Congress of Pharmacy is made and while no delegates were appointed it was yet resolved to send a greeting to this meeting, which took place in Brunswick, Germany. It was also resolved, and this is very noteworthy, that the minutes of the first meeting held in 1851, as well as the proceedings of the Association of 1852 and 1855, should be reprinted, as no more copies were available.

The report on the Drug Market, which in previous years had been of such interest, was this year missing. A difference of opinion, as to the value of the U. S. Pharmacopœia, brought out some very interesting remarks from Prof. Parrish, Mr. Procter, Dr. Squibb and Mr. Maisch, as well as others. The question at issue was, whether a pharmacist should be allowed to differ from the methods and strength of certain preparations as laid down in the Pharmacopœia, and the general opinion seemed to be that, while the Pharmacopœia was a valuable and useful book, nobody should be bound by it because a certain man or some men who had written the Pharmacopœia had advocated certain formulas. The lengthy debate by the leading men of the time was cut short however, by the stern veteran, who always showed a clear judgment and the greatest common sense, S. M. Colcord, of Mass. He said in a quiet way:

"One great object to be attained in the strength of preparations is uniformity. This we cannot get if we differ. There must be some standard; and as long as you adopt the Pharmacopœia, you must adhere to it."

Another interesting discussion took place at the beginning of the meeting. It will be remembered that there were a great many of the earlier members who had the idea that the American Pharmaceutical Association should be an Association of delegates and should derive its strength from local associations and colleges of pharmacy. Although this opinion had been defeated at the previous meeting, there were many signs that it still prevailed in the minds of the leading men, and when at the thirteenth meeting delegates from the Alumni Association of the Philadelphia College of Pharmacy presented their credentials, Dr. Squibb objected, on the grounds that the Alumni Association was not a local association, and that the American Pharmaceutical Association could not recognize any society whose mem-

bers were scattered all over the United States. This opinion was shared by many, with Mr. Parrish leading the opposition. President Gordon sustained the objection and ruled the Alumni Association out. An appeal from this decision was made and the ruling of the Chair was not sustained. While this incident may appear of little significance to some, it must yet be considered one of the greatest victories for the Association; for it again emphasized its national character and absolutely independent position.

It was remarkable that at this meeting a great many new members were added to the roster, the most coming from Chicago, about 25 in all. Here also joined our beloved friend and treasurer for many years, S. A. D. Sheppard, of Salem, Mass.

The various propositions for changes in the Constitution as mentioned previously, were adopted at this meeting and the Committee on Nominations brought in a full list of candidates for all the offices and committees. H. W. Lincoln, of Boston, was elected president. At this meeting the office of Local Secretary was discussed and at the next meeting added to the list of offices. Mr. Ebert, of Chicago, read at this meeting his first paper on "Oil of Amber." He also took part in all the debates with that youthful impulsiveness and enthusiastic courage which characterized him to his death.

Among the queries the one on Opium and its cultivation in the United States, was of particular interest. Dr. Squibb said:

"I hold in my hand a specimen of opium, made from poppy grown in Virginia, in the neighborhood of Lynchburg, by Powhatan Robertson. It is understood that large quantities were made and used in the medical practice of the Southern armies, when they were prevented from procuring from abroad a sufficient supply of the drug. I would like to have the Association receive it, and refer it to Israel J. Grahame for examination; if he is willing to undertake that matter, it would doubtless be very acceptable to the Association. There is no doubt about its authenticity; it came directly without passing through second hands. I have heard it said that we could cultivate opium in this country; it would be a great advantage."

And again

"I have heard that the culture of opium was attempted in Alabama and in Florida, in the neighborhood of Apalachicola, to a considerable extent. It was found to be deleterious to the field hands, and was abandoned on that account in some localities. That large quantities were produced seems to be indisputable."

This brought forth the remark from Mr. Henchman, of New Hampshire, that:

"During the war of 1812, when opium was very scarce, some parties produced it in New Hampshire, and it sold from ten to twelve dollars a pound. It was then of very good quality. After he had established a market, the producer manufactured a very good looking article but much inferior."

Mr. Parrish read an interesting paper on "Filtering and Filtering Apparatus"; while Mr. Maisch read at this meeting a lengthy treatise on "Rhus Toxicodendron," showing that the poisonous principle in this plant is an acid and not, as was supposed a number of alkaloids.

Thomas S. Wiegand, of Boston, read a paper on "The Obligations of Pharmacutists in Respect to the Instruction of Those in Their Employ," and made a strong plea for the proprietors to instruct their apprentices better, closing with the words:

"In concluding these hasty thoughts upon so important a subject, I would suggest the propriety of the Association urging, with all its influence, the adoption of some scheme

calculated to render the practical instruction of pharmaceutical students a leading feature among our members."

It will be seen from these remarks how feebly and how slowly the demand for higher education arose, and how it took from four to five decades to bring it to the present height. Another paper along the same line, was that called "Fidelity to the Pharmacopœia," by James W. Mill, in which he uses a beautiful simile, and says:

"Guided by no such acknowledged standard of authority, the preparation and dispensing of medicines would be involved in extreme confusion and uncertainty. Like a ship at sea without chart or compass, Pharmacy would drift helplessly on the turbid waters of empiricism, and, finally, despite the utmost efforts of its crew, be lost amid the rocks and breakers of quackish pretention, or the sordidness and selfishness of mere trade and traffic. As the compass is to the mariner, so is the Pharmacopœia to the pharmacist, pointing out to him the course by which to steer his pharmaceutical ship, so as to safely guide it into the haven of professional integrity and material prosperity. Itself, indeed, the creature of Pharmacy, it yet in turn aids greatly in its advancement. A standard for the guidance of pharmacutists themselves, it also furnishes a medium by means of which the physician and pharmacist can understand each other in the writing and dispensing of prescriptions. Compiled by able and conservative minds, it is a safe and trustworthy guide, containing within its pages, as it were in a nut-shell, the concentrated results of many previous years of observation and research, thus supplying to all pharmacutists alike, in a cheap and compact form, the most reliable formulas for the preparation of its various products that science and practical experience have yet devised; fallible, of course, like all human productions, it is none the less entitled to full confidence and support. The Pharmacopœia should, however, be regarded as not simply advisory or recommendatory, but as authoritative."

A number of papers at this meeting dealt with the question of economizing and saving alcohol. Owing to the enactment of new internal revenue laws, the price of a gallon of alcohol had risen from 75c to nearly \$3.00 and the question of saving, was of course of great importance. New processes of making tinctures and fluid extracts were recommended and stills of all kinds were presented at this meeting for the recovery of the alcohol used in their manufacture.

The fourteenth annual meeting of the Association was held in Detroit, Michigan, H. W. Lincoln, of Boston, presiding at the first half of the meeting, and the newly elected president, Frederick Stearns, during the second half.

The amendment of the Constitution offered the previous year, to establish the office of "Local Secretary," was adopted in the course of the meeting. Mr. P. W. Bedford, of New York, was elected the first Local Secretary of the Association.

In his address President Lincoln reviewed the activities, the work and the gradual growth of the Association, and attached to it a tabulated statement of the number of members of each state. From this table, in which thirty-two States, one territory, the Dominion of Canada, New Brunswick, and Bermuda were represented, it appears that the number of members had increased since 1853 from forty-four to six hundred and seventy-one, showing a continuous increase with every year with the exception of the last one. This was owing to the fact that a great many members were dropped on account of non-payment of dues.

In the course of the meeting Professor Parrish took occasion to make a few remarks on the facilities of education of pharmacists in the United States, from which we quote the following:—

"There is not a city of the first class in the United States that might not, from the apothecaries residing in it, furnish a sufficient class to sustain a College of Pharmacy."

He then reviews shortly the work of the various colleges and records that the

attendance is proportionally small particularly in the large cities such as New York and Philadelphia. He then continues:

"Now the question for us to consider is this:—Cannot this Association exert its influence to improve the conditions, and extend the appreciation of the colleges in the United States and to establish others when practicable? In Cincinnati they have not for a number of years had any successful teaching. In none of the cities but New York, Philadelphia, Baltimore and St. Louis are there any colleges attempting to get along and keep up the instruction. I don't know that we could do anything, but I think the weight and influence of the Association should be thrown in this direction. That is the way in which we are to raise the status of pharmacy in the United States. It is through generations to come. We that have got ahead, and feel like relinquishing our connection with business, cannot do a great deal except to use our influence in that direction; but the young men themselves, who are to be educated in pharmacy, will raise the American Pharmaceutical Association hereafter to be a body of far greater efficiency than it has ever been, judging from those we have among us who have recently availed themselves of the advantages of pharmaceutical instruction. I hope it will rest in the minds of members of the Association whether we cannot do something to wake up the very large constituency we have to the importance of sending their apprentices and those over whom they have influence, to obtain a systematic instruction in pharmacy."

Frederick L. Stearns took occasion to follow with these words:

"The remarks that have been made by Prof. Parrish, lead me to say a word in regard to the influence of this Association in the respect of the formation of local Associations, not merely educational ones, but societies for mutual improvement other than educational, for social influence and trade influence. We need to get the druggists together in the towns and let them become acquainted with one another, let them know each other better, so as to rub off the corners, trade-jealousy and antagonisms, which are very apt to exist between members of the same profession. I think the influence of the Association can be brought to bear in this direction with great benefit. Throughout the country the druggists who are not members of this Association, and who do not understand its object look upon it with askant eye. They think that by joining the Association they may involve themselves in some way—they don't exactly understand how—but the very moment they become informed as to the objects, advantages and influences of the Association they are ready to join. I can say for myself that I have been a member of this association for fourteen years and have spent considerable amount of money in attending its meetings, but I know it has paid me ten-fold in a pecuniary sense alone, to say nothing of the many other advantages I have reaped from my connection with it. I am very glad, therefore, that the remarks of Prof. Parrish were made and I cordially endorse them."

The remarks of these gentlemen were not followed by any particular action and it might appear unnecessary to record them in a history of the Association. But deeds and actions are very often the result of long and quiet agitation and the men in whose minds the first instigation originated are sometimes forgotten as others take up their work and, often, bring it out as their own. It is the office of the true historian to trace the development of the spirit that underlies all great actions back to the originator; and remarks of the kind recorded above, are more apt to act as a leaven and produce great results than strong, impetuous and radical motions of reform. In these few and gentle words, expressed spontaneously in the midst of the meeting, the beautiful spirit of fraternity that characterized the actions of our Association in those days, comes out in a wonderful way and they show how the leading men of those times cast their eyes and thoughts forward and saw in the future that greatness of the Association to which it has grown at the present time.

When we look over the list of the newly-elected officers of the Association, we cannot but be struck with the galaxy of important and great names that we see this year. Many of them were selected for office for the first time, others had

been working in the interests of the Association since it began. Where could a finer array of great names be found than the following:

Frederick Stearns.....	Detroit, Mich.
Prof. E. Parrish.....	Philadelphia, Pa.
Charles A. Tufts.....	Dover, N. H.
T. S. Wiegand.....	Philadelphia, Pa.
Albert E. Ebert.....	Chicago, Ill.
W. J. M. Gordon.....	Cincinnati, Ohio
Prof. J. M. Maisch.....	Philadelphia, Pa.
C. Lewis Diehl.....	Louisville, Ky.
Prof. F. F. Mayer.....	New York, N. Y.
Prof. P. W. Bedford.....	New York, N. Y.
Samuel Colcord.....	Boston, Mass.
Prof. W. Procter, Jr.....	Philadelphia, Pa.
Dr. E. R. Squibb.....	Brooklyn, New York
Robert J. Brown.....	Leavenworth, Kansas

An interesting debate took place when the special committee on the Internal Revenue Law, Dr. E. R. Squibb, Chairman, presented their report. It was again Prof. Parrish, who objected to the number of laws enacted by Congress and he showed how absurd it was to classify all preparations under the same heading. As the Pharmacopœia was no authority at that time, there were, for instance, a great many formulas for Citrate of Magnesia in use, and according to Prof. Parrish's understanding of the law, all of these required a revenue stamp, except the one made by the formula of the Pharmacopœia, which he claimed to be the worst of all. His own preparations, that were prescribed by physicians all over the country, came under the same class, simply because in some of them he deviated slightly from the formulas of the Pharmacopœia. Dr. Squibb defended the action of Congress and the committee, and a careful perusal of the whole debate shows that the difficulty actually arose from the fact that there was no established standard or authority for any preparation whatsoever.

The Treasurer's report caused lengthy remarks. It had been necessary to levy a special assessment in order to avoid a deficiency, and the treasurer again called attention to the fact that the life members who were exempt from payment were increasing at a rate greater than new members could be procured and earnestly urged relief in this respect.

A number of amendments to the Constitution were proposed. It took however another year until final relief on this vexing question was found.

Delegates were also appointed for the next International Congress held in Paris in 1867.

The report on the Progress of Pharmacy, presented by the Chairman, Enno Sander, comprising about sixty pages of the proceedings, was a very exhaustive treatise on everything that had happened in the previous years in the line of pharmaceutical development. As a peculiarity, it might be mentioned that in nearly every report at those times, the formulas for Syrup of Copaiba and Syrup of Cubebs are given, preparations that have long since disappeared from general use. The Chairman pointed out the difficulty of compiling this report and makes the remark:

"It occurred to my mind that all these difficulties might be obviated to a great extent by appointing a permanent reporter on the Progress of Pharmacy."

This is the first mention of a "permanent reporter on the Progress of Pharmacy."

Interesting papers were presented on the production of wines in various parts of the United States. Albert E. Ebert, from Chicago, presented specimens of Essence of Beef, the first made in this country. From the scientific papers, we notice a great many in this year that contained reports on the improvement of the processes in Pharmacy, as for instance:—William Procter on Sassafras; James W. Mill on Granular Salts; Thomas Doliber on Benzoinated Lard and Valerian; Wilson Pile on Acetate of Ammonia; C. Lewis Diehl on Chemical Processes; Notes on Liquor Bismuth by George F. H. Markoe; and John M. Maisch on Chloroform, on Brandy and on Sherry Wine.

A paper of some historical value was that by Prof. E. Parrish entitled, "A Discourse on Titles." As has been stated, the general name for the members of our profession was PHARMACEUTIST. In this paper, Mr. Parrish proposes the name PHARMACIST, and the word "Pharmaceutical" instead of "Pharmaceuti-cal."

Dr. Squibb agreed with Prof. Parrish and said: "I consider the term Pharmacist a decided improvement on Pharmaceutist." No action was taken on this point however, and the proceedings continued for a number of years to speak of "Druggist and Pharmaceutist."

The following meeting, the fifteenth, was held in New York in 1867. Owing to the sickness of President Stearns, the Vice-President, Mr. Parrish, presided at the first half of the meeting. This meeting was a note-worthy one in more than one respect. There were nearly 100 members present. As new members at this meeting, mention should be made of Joseph P. Remington, of Brooklyn, and Dr. C. F. Chandler, of New York. Important changes in the Constitution were made so as, finally, to relieve the strain on the treasury. They all tended to raise more funds and an admission fee of \$3.00 was required. The annual contribution was to be increased to \$3.00; life membership abolished for the future. The fee for the certificate of membership was made \$5.00. After long debates on these propositions, they were finally all passed. A great number of the old members resigned their life-membership and continued to contribute like ordinary members. When the Nominating Committee brought in their report, they named Dr. E. R. Squibb, of Brooklyn, for President. Dr. Squibb, however, declined, stating that stress of business prevented him from accepting the office. He asked the Association to substitute the name of J. Milhau, of New York, in place of his own. After a lengthy debate this was finally done, and Milhau was elected President for the following year.

The report of the Committee on Drug Market, which comprised thirty pages of the proceedings, gives a general review and has tabulated statistics of imports in the different ports of entry, giving the amount of importation and the values. This gave rise to a lengthy debate, in which all the leading men of the time participated. The pictures that were revealed of the status of the drug market in the United States were not pleasant ones. Adulteration and sophistication were the rule, and articles intended to sell as adulterants for staple goods were openly advertised as such, as, for instance, Cream of Tartar was adulterated with a series of articles, one called terra-alba and claimed to be "the best and most reliable adulterant of Cream of Tartar." Dr. Squibb stated that in the United States, there was "pure Cream of Tartar;" next "Cream of Tartar," then came "Cream

of Tartar No. 1," "Cream of Tartar No. 2," and so on. No. 1 contained about ten percent. of adulteration, while the lowest grade contained nearly 80%.

Complaints were also made about the varying price of Alcohol, which fluctuated between three and four dollars per gallon.

At this meeting, for the first time, delegates to the International Pharmaceutical Congress made a report to the Association, which in many respects is of great interest. The two delegates who had attended the Congress were William Procter, Jr., and John Faber. Mr. Procter received the honor of being elected one of the Vice-Presidents for the next Congress. At the deliberations of this Congress the delegates from America were as a rule on the negative, voting on all questions alone and against the delegates from Europe. Some of the questions discussed were the following:

"Shall there be unlimited liberty as in ordinary mercantile business? Shall there be a free practise with the guarantee of a diploma and personal responsibility under the common law? Shall there be a wise regulation by law, designed to insure the public interests and protect the pharmacutists?"

All the delegates voted against the first query; on the second, all voted on the negative except those from the United States. When the third was voted upon, all the votes were cast in the affirmative, excepting those of the United States, which were for the negative.

The second question was: "Is it proper to limit the indefinite multiplication of pharmaceutical shops?" It was referred to a Committee consisting of one member of each country. All reported in favor of limiting the trade except Mr. Faber, of New York, who alone voted in the negative.

The third question was: "Is it proper to demand the creation of institutions of a disciplinary character, destined to maintain the 'honorability' of the profession of Pharmacy, by insuring its correct practise, and to represent and protect it in all its exterior relations?" The committee to whom this was referred reported in the affirmative, which view was adopted by the Congress. The delegates' report then stated:

"As some of the speakers had alluded to pharmacy in America in a way that was calculated to give a wrong impression,—a short statement was prepared by one of us, and permission was obtained to read it in English, so that it might go on record. The origin of the colleges was referred to, and the rise of scientific pharmacy, in the United States, to the separation of dispensing from the practice of medicine. A general view was given of our progress and allusion was made to the subjects of the Pharmacopœia, and to weights and measures."

The report of the Committee on Internal Revenue Law was also of great interest, as it gave the details of a suit by the government against an illicit distiller. In the course of the testimony, two witnesses stated the proportions and yield of the process.

"A quantity of twenty bushels of grain for making a mash, generally consists of fourteen bushels of Indian corn, four bushels of rye, and two bushels of malt, though a much larger proportion of rye is preferred where a fine quality of whiskey is aimed at. The proportion of water used in making the mash, was the subject of investigation, as affecting the issue of a case on trial. According to the evidence for the United States, thirty-four gallons of water were usually added to each bushel of grain in the mash, while the beer, after dilution with cold water, usually contains forty to fifty gallons to a bushel. The best temperature for 'mashing' was stated to be from 158° F. to 190° F."

The methods adopted by the Government to prevent improper manufacture of

alcohol and whiskey, were discussed at length in this report, but no action of any kind was taken.

The report of the Reporter on the Progress of Pharmacy comprised 144 pages, more than one-third of the whole book, and it gives an idea of the enormous amount of work that the Reporter, C. Lewis Diehl undertook in the interest of Pharmacy. Among the many interesting new articles that this report contained we notice Liquid Soap mentioned for the first time and the method of its manufacture from glycerine, oleine and solution of potash. Also "Liquor Carbonis Detergens," a new form of antiseptic for local application, "was said to be an alcoholic solution of coal tar, containing probably carbolic acid and other acids, with dark tarry matter. It forms a permanent emulsion with water." The Solution of Citrate of Magnesia continued to be a puzzling question and four different formulas for this preparation are given.

A good idea of the amount of care that the leading pharmacists took in those days in the preparing of prescriptions, is given in the discussion of a paper, in answer to Query 16, by James W. Mill on Ergot. Mr. Maisch stated that he only powdered two drachms at a time, which took about an hour. He said:

"I will cheerfully add my testimony to the fact of the efficacy of ergot when freshly powdered. I disagree with Mr. Wiegand of the necessity of powdering it for immediate use. As I powder it, it would take me about an hour to powder two drachms. I have a practise of never keeping on hand more than two or three drachms. Powdered ergot is never kept more than two or three weeks—when that time has elapsed, it is thrown away and another portion is powdered and kept on hand; two drachms being about enough to use for one or two prescriptions. The physicians who have used it have been very well satisfied with it. I pass my powder through a sieve of sixty, and that is why it takes a good deal of trouble."

A remarkable resolution was offered by William A. Brewer, of New York.

"Resolved, That while we hold to a high appreciation of the beneficial influence of the accustomed social entertainments tendered to the members of this Association and their friends, by the members of the drug trade in the various cities where the Association meets from time to time, and while we cherish with gratitude and thankfulness the good feeling which prompts these munificent exhibitions of generosity, we cannot but hope that, hereafter, the solicitors of the contributions for such purposes, may get permission from the donors to devote a moiety of said contributions to the endowment of a central library and a cabinet of materia medica and collateral matters for the purposes and use of the Association."

This resolution was later on discussed but not accepted. It is the first crude idea of creating a permanent home central library and museum for the American Pharmaceutical Association.

A communication from the East River Medical Association of the City of New York, signed by Dr. J. Shrady, condemning the renewing of prescriptions, did not meet with the approval of the Association and a somewhat evasive reply was given.

In the report of the Committee of Queries which was read by Mr. Squibb, it is noticed that in the seventeenth query the word "Pharmacist" is used. This is the first time that this form is used in an official paper of the Association.

"What is the best scheme of practical instruction for young men preparing for the business of PHARMACISTS, aside from the necessary service in the shop, with especial view to those who are unable to attend a College of Pharmacy?"

This query was answered by Mr. E. Parrish the following year.

(To be continued.)

THE MINUTES OF THE SESSIONS OF THE SCIENTIFIC SECTION.

The first session of the Scientific Section was held Tuesday afternoon, August 25th, 1914, in Room D, of the Convention Floor of the Hotel Pontchartrain.

The meeting was called to order by Chairman Ruddiman, at 2:00 p. m., who said:

"Conservation seems to be the word of the times. At this meeting several changes are being inaugurated for the purpose of conserving time, and that is one reason why the present Chairman has broken away from the time honored custom of giving a formal address. The present officers of the Section believe that much of the good to be derived from the meeting is to be found in discussions. In the past many a good paper has been passed by, perhaps, because it was not taken in by the members, or they were not prepared to discuss it. To get the good out of the discussion we must have it at the meeting. I presume that some of you are somewhat like myself; when I see a paper printed, followed by a discussion, I look at the discussion first. I think that the discussion is one of the interesting parts of the paper.

"Then, again, where the writer of a paper is not present to read his paper, it has been the custom to read that paper by title. I think that is not fair to the writer. He has put time and labor into a paper full of good ideas and I think it should be given due consideration.

"I have gone over the papers which have been sent in, particularly those where I knew the writer would not be present, and have made a very brief abstract of the papers with the idea of presenting that brief abstract in case the writer is not present. Then if the members of the Section wish the paper read in full, they may have it read.

"I regret to say that the members of the Association have not coöperated with the officers quite as well as I had hoped for. Up to yesterday morning, only about half of the papers announced on the program had been turned in, consequently the officers have not been in a position to arrange the program to the best advantage, or to select papers for discussion. My idea was to have these papers on hand, and to get some one or two members of the Association to read them over beforehand, in order to be prepared to discuss them in a few words and to the point. That is what we want, I think, in the discussions.

"A resolution introduced at the Nashville meeting will be called up for action some time during the meeting, and this resolution provides or requires that all papers be handed in to the Chairman at least one week before the meeting. I understand there will be a discussion of a similar topic before the Council tonight, and it is proposed to require papers handed in to all sections of the Association, to be handed in one month before the meeting. Probably this will be decided upon at the Council and later at the General Session.

"With these few explanations we will proceed at once to the business.

"The first thing in the order of business, as printed in the by-laws, is the Secretary's report.

"SECRETARY SCOVILLE: I have no report to make, Mr. Chairman.

"CHAIRMAN RUDDIMAN: The next order of business is the report of standing committees, and Committees of the Association which report to this Section. Some of these reports are rather lengthy, and with the consent of the Section we will postpone these reports until a later session unless there be some objection.

"MR. PHILIP ASHER: I move that the reports be disposed of in that way."

Motion seconded and carried.

"CHAIRMAN RUDDIMAN: The next order of business is the appointing of a nominating committee, which committee will present two names for each office for the coming year. This Committee is to report before the adjournment of this

section. On this Committee, I will appoint: Wm. B. Day, of Chicago; Martin I. Wilbert, of Washington; Prof. Jordan.

"The Committee will please report before the adjournment of this Session two names for each of the offices, which are Chairman, First Vice-Chairman, Second Vice-Chairman and Secretary. The election of these will be at the last session of the Section.

"The next order of business is miscellaneous business, and under this, I presume, would come the resolution which was presented at the Nashville meeting at the last session too late to be acted upon. I have already referred to this resolution. It is to change the by-laws requiring the papers to be handed in one week before the meeting. As this subject is to be discussed before the Council to-night, I would suggest that we defer action on this resolution until a later session and see what is best to do to keep in harmony with the General Session.

"Is there any other business to come before the Section? (No response.)

"We will proceed at once to the reading of the papers. The first paper on the program is on the subject of 'Uniformity in Dosage of Radium Emanation,' by Dr. Wm. Jay Schieffelin."

MR. SCHIEFFELIN:—Mr. Chairman and Gentlemen of the Section: I feel that it is a presumption for me to address a gathering of so many scientists and teachers of science; what I have to say is for the men who studied chemistry and physics twenty-five years ago, rather than for those who graduated last spring.

In case I tell you things that many of you know, it will be simply because in speaking of this wonderful subject of radium and its emanation from the point of view of pharmacy, it seems important to refer not only to its properties, but to say a word about its occurrence, and the theory of its existence.

CHAIRMAN RUDDIMAN: Dr. Schieffelin's paper, if there are no objections, will take the usual course. The next paper on the program is "The New Science of Immunology," by Dr. F. E. Stewart, of Philadelphia. (Printed in *September* issue.)

M. I. Wilbert then read a paper entitled, "Official and Other Tinctures," which was referred for publication.

C. F. Ramsey then read a paper on, "Difficulties in the Manufacture of Certain Fluid Extracts."

Mr. Scoville presented a paper on, "Glycerite of Bismuth." (Printed in *September* issue.)

Dr. Stockberger read a paper entitled, "Comparison of the Physical Properties of Some Volatile Oils, with Special Reference to the Requirements of the U. S. P., 1910."

A paper was then presented entitled, "A New Method for the Distinction of True From Synthetic Oil of Wintergreen," by G. H. Watson.

CHAIRMAN RUDDIMAN: The next paper on the program is "Laboratory Notes," by George E. E'We, and C. E. Vanderkleed.

Mr. Vanderkleed then read the above paper in abstract.

The Nominating Committee then presented the following nominations for officers for the ensuing year: For Chairman, H. Englehardt, H. C. Hamilton; for First Vice-Chairman: W. L. Scoville, J. H. Turner; for Second Vice-Chairman: L. E. Brown, F. E. Bibbins; for Secretary: Wm. Mansfield, Azor Thurston.

On motion of Mr. Mansfield the Section adjourned to meet Wednesday afternoon, August 26th, at 2 o'clock.

SECOND SESSION.

The second session of the Scientific Section was called to order Wednesday afternoon, August 26th, 1914, in Room D, of the Convention Floor, of the Hotel Pontchartrain, by Chairman Ruddiman.

On motion, the minutes of the Secretary were approved.

The following papers were presented:—"The Assay of Opium," by A. R. L. Dohme. (Paper read in abstract by Dr. Englehardt.) And "The Lime Assay of Opium," by A. B. Lyons; which two papers were presented for discussion together by Chairman Ruddiman. "A New Method for the Estimation of Glycerin in Pharmaceutical Preparations," by C. H. Briggs, and "On the Estimation of the Assay of Glycerin," by F. T. Bradt. These two papers were also discussed together. "The Determination of Glycerin in Tablets and in Confections," by LeRoy Forman; "Notes on the Assay of Hydrastis and Fluid Extract of Hydrastis," by H. W. Jones; "What is the Best End-Point of the Reaction in the Frog Heart Method of Digitalis Assay," by L. W. Rowe; "Preliminary Notes on a New Pharmacodynamic Method of Assay," by Paul S. Pittinger; "Medicinal Plant Gardens," by Dr. Stockberger, (printed in October issue); "A Third Alkaloid from Gelsemium," by A. E. Stevenson and L. E. Sayre; "The Necessity of a Method of Estimating the Intrinsic Value of Essential Qualities of Coffee," by Prof. L. E. Sayre. On motion of Mr. Gordon the Section then adjourned to meet on Thursday morning.

THIRD SESSION.

The third session was convened at Room D, Hotel Pontchartrain, Thursday at 9:30 a. m.

On motion of Mr. Asher the reading of the minutes of the last session was dispensed with.

Papers were read as follows:—

"Morphine Nitrate and Morphine Acetate," by H. Englehardt and O. E. Winters; "Elementary Phosphorus," by the same authors; the "Estimation of Calomel," by R. I. Grantham.

The Section then elected the following officers for the ensuing year:—Chairman, H. Englehardt; First Vice-Chairman, W. L. Scoville; Second Vice-Chairman, Linwood E. Brown; Secretary, William Mansfield. The report of the Committee on Medicinal Products was presented and on motion of Mr. Gordon it was accepted to take the usual course. (Report printed in September issue.)

The report of the Committee on Ebert Prize was accepted and referred for publication. (Printed in October issue.)

The report of the Committee on Physiological Testing was received and referred for publication. (Printed in October.)

It was voted to approve the publication of the Digest of Comments on the Pharmacopœia of the United States, published by the Public Health Service of the United States and that a resolution be sent to the Surgeon General to that effect.

The following papers were read in abstract:—"The Glands of Internal Secretion and Their Importance as Therapeutic Agents," by Dr. Cary P. McCord;

"The Composition and Assay of Diacetyl-Morphine Chloride and Heroin Chloride," by R. T. Harris and A. M. Clover; "The Analysis of Cigarettes, Cigars and Tobacco, and the Use of Lloyd's Reagent in the Determination of Nicotine," by Azor Thurston; "The Structural Variation of Allspice," by Dr. William Mansfield; "Cannabis Sativa, Is the Medicinal Value Found Only in the Indian-Grown Drug?" by H. G. Hamilton; "The Pharmacognosy of the Medicinal Rhamnus Barks," by Prof. E. N. Gathercoal; "Notes on the Estimation of Morphine and on Lloyd's Reagent," by H. M. Gordin and J. Kaplan; "Notes on a Glycerin Substitute," by Joseph Feil; "Notes on a New Alkaloid found in Nux Vomica," by Hugo H. Schaefer.

The hour being late it was voted that the remaining papers be considered as read by title and that they be referred for publication.

On motion of Mr. Kirschgessner it was voted to dispense with the formal installation of officers, and that they be considered as installed in office.

Voted to adjourn.

THE DETERMINATION OF GLYCERIN IN TABLETS AND CONFECTIONS.

LEROY FORMAN.

At the present time the use of glycerin tablets and confections is very great. Upon consulting a number of journals, as well as chemical literature, we find no work of any kind reported upon this class of preparations, which are sold largely through the drug trade.

It is a well recognized fact that glycerin taken in this form has a very soothing effect for irritations of the throat and bronchial tubes.

This investigation was entered upon because there is no available literature on this class of tablets, and, secondly, it was considered as necessary for tablets sold as "Glycerin tablets," to contain an appreciable amount of glycerin, as it is for any medicated tablet to contain an appreciable amount of the chief active constituent for which it is named.

Samples of six different popular brands of such tablets, were purchased in drug stores, two of these samples being plain glycerin tablets, one, honey and glycerin, and three, menthol and glycerin.

The official method of the A. O. A. C. was tried for the estimation of glycerin, but in evaporating the solution, obtained by dissolving the tablets in water, to such a small volume as the A. O. A. C. directs, some glycerin was probably lost, due to the very slow evaporation after the solution had obtained a syrupy consistency, which results when the volume is about 25-30 cc. But if milk of lime is added at this time, the resulting mixture can be evaporated to a stiff paste, which can then be carried through the regular A. O. A. C. procedure. The complete method used is as follows:

Enough tablets were taken to weigh about 5 grammes, these were dissolved in water, evaporated to syrupy consistency, 15 cc. of milk of lime added and the

mixture evaporated to a thick paste, stirring frequently to prevent it from drying hard on sides of dish. This mass was then rubbed in smooth paste with 5 cc. of water, 45 cc. absolute alcohol was added, heated to incipient boiling, and heavy particles allowed to settle. The supernatant liquid was then transferred to filter, and dish and filter washed with 95% alcohol until filtrate measured 150 cc. This was evaporated on a water bath at 85° to a syrupy consistency. This residue was taken up with 10 cc. absolute alcohol, transferred to 50 cc. graduated cylinder and the dish washed with two 5 cc. portions of absolute alcohol and transferred to the cylinder; then 30 cc. of anhydrous ether were added in 10 cc. portions and shaken thoroughly after each addition.

This was allowed to stand until perfectly clear, then decanted through a dry filter, and the cylinder and filter washed with 25 cc. of alcohol-ether mixture in above proportions. This was then evaporated to 5 cc., 20 cc. of water added and evaporated to 5 cc., 10 cc. water added and again evaporated to 5 cc. This was transferred to a 50 cc. volumetric flask, the beaker washed with hot water, then freshly precipitated silver carbonate (0.1 gm. silver sulphate, plus excess sodium carbonate), was added. The mixture shaken frequently during ten minutes, then 0.5 cc. basic lead acetate was added and again shaken frequently during ten minutes and made up to mark.

Twenty-five cc. of the filtrate was placed in a 250 cc. flask, 1 cc. concentrated sulphuric acid added, to precipitate excess of lead, then 30-40 cc. strong bichromate solution (7.5 gm. potassium bichromate and 15 cc. concentrated sulphuric acid per 100 cc.), and 24 cc. concentrated sulphuric acid, and the mixture placed in boiling water bath for 25 minutes. Make up to mark, cool, take aliquot of 20 cc., dilute with 50-70 cc. water and titrate excess of bichromate with ferrous ammonium sulphate solution (30 gm. per liter and 50 cc. sulphuric acid).

Standardize ferrous ammonium sulphate solution against a 1-20 dilution of bichromate solution, then calculate glycerin, by finding excess of bichromate in oxidized glycerin solution. The number of cubic centimetres of strong bichromate added, minus excess found after oxidization, multiplied by 0.01 gm. equals weight of glycerin in the 25 cc. purified solution used. This multiplied by two gives total weight of glycerin. Then percentage is then calculated as usual. The following table shows results of the examination:

Kind of Tablet	Wt. each Tablet	% Glycerin	Wt. Glycerin per Tablet
1. Plain Glycerin	5.46 gm.	3.13	0.1708 gm.
2. Menthol and Glycerin	1.50 gm.	1.00	0.015 gm.
3. Menthol and Glycerin	1.44 gm.	1.09	0.0156 gm.
4. Menthol and Glycerin	1.48 gm.	0.98	0.0146 gm.
5. Plain Glycerin	2.33 gm.	13.60	0.3168 gm.
6. Honey and Glycerin	3.29 gm.	12.07	0.397 gm.

The above results indicate that of the six samples examined, but two (numbers 5 and 6) are really entitled to the use of the word "Glycerin" in an unqualified form in the title.

THE MANUFACTURE OF FLUID EXTRACTS.

BY C. F. RAMSAY.

Those unfamiliar with the manufacture of Fluid Extracts little realize how necessary it is to have a particular knowledge of each drug, especially in making large quantities of these extracts. It is possible to make a pint, or two, of a Fluid Extract without trouble, but in the manufacture of five hundred or a thousand pints, in many cases difficulties will be encountered. Some drugs require to be finely powdered, while others are extracted better in a coarse condition. Drugs must be run in copper, iron, or tin percolators according to their nature. Even after a proper menstruum is found for a given drug, working on a small scale, when large quantities are handled, that menstruum does not always prove satisfactory. In making Fluid Extracts, the object is to have each c.c. represent one gram of drug and in order to do this it is often necessary to continue percolation. Some drugs may be extracted in a week, while others require three or four weeks.

Knowing the best menstruum for a given drug on a small scale, it is then necessary to adapt it to manufacturing conditions on a large scale. The drug may be of a mucilaginous nature and will swell so that percolation is impossible.

In such a case it is necessary to mix the drug with shavings or with sawdust. For instance in the manufacture of Fluid Extract of Squill (hydro-alcoholic), we are dealing with a drug that contains about 22% of sugar and a mucilaginous principle, resembling dextrin, known as *sinistrin*. If Squill is ground and macerated with dilute alcohol, it will swell so that percolation is impossible. Even after mixing the cut bulb with shavings, percolation is very slow. After the percolate has been obtained, in some cases two distinct layers will be found, the sugar layer being at the bottom. It is impossible to remove this sugar layer without losing some activity. The best results are obtained by using an 80% alcoholic menstruum and operating on the cut bulb. The writer speaks of the alcoholic extraction of Squill, because a better product is obtained with that menstruum than by the U. S. P. method, as was pointed out by Hamilton in the American Journal of Pharmacy.

Another drug difficult to extract, because of its mucilaginous character is *Cereus Grandiflorus*. This drug is obtained in the green condition and has to be treated with alcohol immediately. Although 95% alcohol is used as a menstruum, there is a large amount of moisture in the drug which dilutes the alcohol sufficiently to produce a sticky mass. This is a case where it is better to wash the drug with a little alcohol, concentrate this portion in the still, and then percolate the washed drug with more alcohol. In the case of Bladder-wrack, we have another drug difficult to extract because it is so mucilaginous. It is also very difficult to thoroughly extract *Calumba*, even after mixing with shavings. This drug contains about 35% starch and 5% of gum which accounts for the trouble. *Lappa* and *Squaw Vine* are also in this class. The writer would suggest that a strong alcoholic menstruum be used on drugs of this nature.

Some drugs are of a very light nature and, if not properly packed, they will

not give full strength "fluids" as the menstruum will pass through too quickly. In dealing with drugs of this kind, it is best to have them packed in as many percolators as possible, so that a given amount of menstruum will be in contact with the drug a longer time. Otherwise it would be necessary, in most cases, to use so much menstruum to flood the drug, that more than a pint to the pound would be drawn off. Arnica Flowers often rises to the top of the percolator, leaving considerable menstruum at the bottom, which of course is not in contact with the drug. Other drugs in this class, which often give trouble, are Colocynth, Quassia, Red Clover Blossoms, Sourwood Leaves and Marrubium.

Very often drugs are difficult to extract because of their hard structure, as for instance, Physostigma, Podophyllum, and Stone Root. In handling these drugs it is advisable to have them in a fine powder. Physostigma contains about 48% of starch, 23% of proteids, gum and fat which add to the difficulty of extraction. Using a coarse powder of Physostigma, the writer was able to obtain only from 40% to 60% of the alkaloid.

The addition of glycerin to a menstruum often retards percolation. This is especially noted when the drug contains considerable extractive matter, as the glycerin serves to make it more viscous and sticky, thus making percolation slow and difficult. The writer has experienced trouble in this respect with Uva Ursi, Geranium, Hydrastis, Rose, Hamamelis and Cinchona. Percolation proceeds much easier without glycerin, but of course such fluid-extracts would not be in accordance with the U. S. P.

Some drugs contain considerable extractive matter and, if not properly percolated, are bound to give trouble. With these it is best to divide the drug into as many percolators as possible and reserve a portion of the first percolate from each percolator. Otherwise the menstruum keeps getting heavier and so saturated that it is almost impossible to get it through the last portion of drug. In this class are such drugs as Poplar Buds, Black Willow Bark, Elder Flowers, Helonias, Digitalis, and Mistletoe.

In extracting drugs containing considerable oil, such as Sabal and Sandalwood, it will be observed that the first portion of percolate is milky, due to the separation of oil. In this case the 95% alcohol used as menstruum, is diluted by the moisture of the drug, so that it will not dissolve the oil. This portion should be concentrated in the still and percolation continued with 95% alcohol.

The writer has experienced considerable trouble with the Fluid Extracts of Convallaria and Digitalis. Using the menstruums indicated in the U. S. P., it was impossible to get the full activity from the drug. With Convallaria at times only 50% of the activity was obtained. Many experiments were carried out, on a manufacturing scale, to ascertain the best way of extracting these drugs. It was found that 80% alcohol was the best menstruum for both.

With alkaloidal drugs, it is always necessary to continue percolation, in order to obtain all of the alkaloid. Even then there are some drugs that give trouble. For example, with Cinchona Calisaya, many experiments were made to find out why it was impossible to get the full activity. The writer found that by not adding the glycerin to the menstruum and reserving the first portion of percolate from each percolator very good results were obtained. There is considerable

extractive matter in Cinchona and when glycerin is used in the menstruum percolation is difficult. Sanguinaria (hydro-alcoholic) causes much trouble. The writer tried menstruums of different strengths and also additions of a little hydrochloric, acetic, and nitric acids. If the drug is fine, it packs so that percolation is impossible. The best results were obtained by using 71% alcohol, with about 2% of hydrochloric acid, and having the drug coarsely powdered. Gelsemium is hard to extract, which may be due to the starch and gum which it contains. Nux Vomica also gives trouble. This drug contains about 11% proteid, 6% of sugar, and gum, which may account for the difficulty. Pilocarpus is also troublesome.

Without long-continued percolation, it is sometimes difficult to thoroughly exhaust Sundew, Echinacea, Fringe Tree, Gravel Plant, Adonis, Arbor Vitæ, and Caulophyllum.

As the primary object of Fluid Extracts is concentration, a suitable menstruum should in each case be selected with the object of dissolving and retaining permanently the active constituents of the drug, and in order to do this, each drug must be separately and individually studied. Many experiments are necessary, to determine which is the most suitable menstruum and the best conditions on a manufacturing basis.

NOTES ON A GLYCERINE SUBSTITUTE.

JOSEPH FEIL, PH. G., PH D.

Two years ago, when Glycerine doubled in price, there appeared on the market two very similar substances, under coined names, at about half the price of this article, and for which the following claims were made: "Mixes readily with water, keeps indefinitely, never becomes rancid or ferments, contains no acids, in many respects and for many purposes is far superior to glycerine; made from cane sugar; especially adapted for use where soft, moist results are desired and for which purpose it is being employed successfully in place of C. P. Glycerine, also as a sweetener for food products, and, finally, for all purposes for which C. P. Glycerine is used." The above statements are misleading in almost every respect, especially in reference to its use in U. S. P. preparations, where on trial I did not find a single successful case, except in one instance, viz.: it could be used to keep solid extracts from becoming hard.

A physical examination showed a slightly yellowish color, no odor, an adhesiveness or viscosity resembling commercial glucose, taste much sweeter than glycerine, not cloying or repulsive, sp. gr. 1.402 at 25° C., soluble in water and alcohol, but not in a mixture of three parts of alcohol and one part ether.

Chemically the substance responds to every test for "Glucose" sugars, abundantly and quickly. It seems therefore, that the substance is a reduced cane sugar as claimed, of complex nature and considerable purity, but it is certainly not a synthetic, or near-synthetic Glycerine, and at best might be a substitute for commercial glucose, however, the price, four times that of the last named substance, would prohibit such use.

UNIFORMITY IN DOSAGE OF RADIUM EMANATION.

WM. JAY SCHIEFFELIN, PH. D.

Radium emanation is assuming importance as a therapeutic agent. The Council on Pharmacy of the American Medical Association, has listed radium and its emanation among New and Non-Official Remedies; an increasing number of physicians are using the emanation in their practice, and articles and advertisements on the subject, are appearing in the medical journals. Since radium and its emanation, are becoming recognized as belonging in the *Materia Medica*, their production and properties and the standardization of their preparations, come within the scope of Pharmacy.

Radium is prepared from carnotite (vanadate of uranium and potassium), uraninite or pitchblende (uranium oxide), and samarskite (columbate and tantalate of uranium and yttrium). Radium has an atomic weight of 226, and resembles barium in its chemical properties.

In its characteristic property of radio-activity, radium is sublimely superior to its environment: whether in its natural minerals or isolated from them, and in all of its chemical compounds, it is constantly emitting alpha rays and emanation, at a uniform rate, and there is no known way of influencing or halting this activity, which is not affected by the extremes of heat and cold, by pressure or the strongest re-agents. This radio-activity shows the energy which results from the disintegration or transmutation of radium into elements of lower atomic weights. The energy resulting from the resolution of an element into its constituent parts, is vastly greater than that resulting from chemical combination.

The largest amount of energy released in any known chemical reaction, is from the combination of an equal volume of hydrogen and oxygen to form water, but the emanation of radium, in its successive transformations, accompanied by the expulsion of alpha rays, yields more than ten million times as much energy. Ninety-five percent. of the energy in the radiation from radium and its subsequent products, is in the form of the alpha radiation, a corpuscular radiation in which the corpuscles or alpha particles are positively charged helium ions.

The statement that there are one hundred and thirty-six million alpha particles, emitted by one milligram of radium each second, to one who studied chemistry twenty-five years ago, seems almost humorous, but the description of the apparatus for counting the alpha radiations is so simple that a fourteen year old child can understand it.

Counting the number of particles per second, is possible, because physicists have been able to determine, exactly, the diameter of the sphere, on whose surface the particles are far enough apart to count them.

They place a fraction of a gram of radium in a tube, some thirteen feet long, from which the air is exhausted, which tube has a small orifice at the end, to prevent more than a certain number of alpha particles from coming through, and on the other side of the orifice, is a delicate electrometer with a silvered quartz-fibre mirror, by which a point of light is reflected. Each atom of helium,

charged with positive electricity, causes a tremor in the quartz-fibre, which is magnified by the reflected point of light and recorded on a photograph film. They then have the data required for their calculation,—the weight of the radium, the length of the radius and the area of the orifice through which the little particles went, and as they know this is taking place in every direction; that this amount of radium is shooting out these little particles, (actual, visible, corpuscular particles) in every direction all the time, it is a simple calculation to determine what the number of radiations on the surface of the sphere is. You know radium is magnetic, and they adjust the distance by moving the fragment of radium backward and forward, by use of a magnet outside of the glass tube. By means of this apparatus, Rutherford found that there are one hundred and thirty-six million separate alpha particles radiated from one milligram per second. The spinthariscopes renders a confirmation of this calculation possible.

I have here a modified spinthariscopes, called the radiosmitoscope, which is adjusted so the zinc sulphide screen can be moved out so you can see the radium particles emanating from other bodies outside. I suppose you know how the spinthariscopes is made.

A needle point is touched to the inside surface of the tube which has contained radium; enough radium adheres to the point of that needle to radiate sparks for 1800 years. Seen through a low-power microscope they are like sparks from a blacksmith's anvil radiating continuously.

A milligram of radium expels one hundred and thirty-six million separate alpha particles per second, which are made visible in a spinthariscopes. The alpha rays emitted from one three thousand-millionth of a grain of radium, can be detected by the gold leaf electroscope. The rays are given out uniformly, in all directions, in the form of continuous volleys of tiny projectiles travelling at a rate of 12,000 miles per second. Their range is nearly three inches in air and many yards in a vacuum. They are but slightly penetrating,—being absorbed by thin sheets of aluminum, paper or glass—but pass through a film of glass exceedingly thin. It has been shown that they are atoms of helium charged with positive electricity.

Now, here is a very important thing from a pharmaceutical point of view. Only a fraction of the rays, are set free from solid radium compounds; only a fraction of them come out. The bulk of them are not set free, but are occluded in the salt of radium, or the mineral in which the radium is contained. In order to obtain the largest yield, you must have the largest possible surface. If you have a crystal of chloride of radium, not nearly as many of these little alpha radiations come out as if you dissolved that crystal and spread it out as widely as possible on a surface. If that is done, the number will be very much increased.

Now, the same thing applies to insoluble salts. If you have sulphate of radium, you will not get the greatest amount of emanation from it unless you powder it to the finest degree and spread it out as far as possible. Otherwise, you may get two percent. only, instead of possibly ten percent. of the total emanation available.

The emanation is a gas which, in turn, steadily disintegrates into alpha parti-

cles and radium *A*, from which, in the same way, come Radium *B*, *C*, *D*, *E*, and *F*, in succession. It is from these products, especially Radium *C*, that the beta and gamma rays are given off. The beta rays are electrons of negative electricity, the same as the cathode rays, except that the velocity of the beta particles is much greater, approaching the velocity of light, 186,000 miles a second.

The gamma rays are not considered to be particles of matter, but are waves in the ether, similar to the X-rays. They are far more penetrating than the alpha and beta rays, and are used in the external application of radium in cancer, the others being easily excluded by thin metal filters.

The emanation has an atomic weight of 222 and a characteristic bright line spectrum. It belongs in the group of inert monatomic gases with helium and argon. It is not absorbed by any known re-agent and shows no power of chemical combination. The emanation is one hundred thousand times as active, weight for weight, as radium. Like other gases, it can be collected, confined, and handled, in ordinary glass containers. This is usually done only when it is mixed with enormously greater volumes of air or other gases. Like other gases, the radium-emanation is somewhat soluble in water. It disintegrates at the rate of one-half in about four days, and since the radio-active products, into which the emanation disintegrates, decay at the rate of one-half in a few minutes, it follows that the total radiation from the emanation and the subsequent disintegration-products, decreases at the same rate as the emanation, namely one-half in about four days.

When water with emanation in solution, is left in an open bottle, the emanation diffuses out, and, if the water is shaken up or otherwise disturbed, the process of diffusion of the emanation is accelerated. From ten to thirty percent. of the emanation, in solution in water, may be lost by pouring from one vessel to another.

The strength of radio-active water, is usually expressed in Mache Units per liter. Radio-active water of 2700 Mache Units contains, per liter, as much emanation as is emitted in thirty days by one microgram of radium (1 Mache Unit equals 0.001 electro-static units, one of which equals 3.33×10^{-10} amperes). The radio-activity of water is measured by a fontactoscope, which is an electro-scope with a chamber for ionized air and a scale for measuring and timing the discharge. The instrument is standardized by first testing a solution of a known amount of radium chloride which has been sealed thirty days. Great care must be used in sampling the water.

Water is charged, either by dissolving the soluble bromide or chloride of radium or by submerging the insoluble sulphate. The latter is more economical, but the sulphate must be in a minute state of subdivision and must present the largest possible surface.

There are several ways of accomplishing this:

1. Precipitating the sulphate on asbestos and placing it in a porous cell.
2. Mixing it with charcoal and forming into slabs.
3. Mixing it with cement and forming balls.
4. Mixing it with clay and firing it, forming terra cotta.

Most of these processes are protected by patents. The advantage of using

an insoluble salt is, that it can be employed repeatedly and its use continued indefinitely. The terra cotta rods can be used eighteen hundred years and still have half their radium content available.

Moreover they avoid introducing into the organism a permanent radio-active body, as is done if a soluble salt is administered.

While a given amount of radium always emits a constant and uniform amount of emanation, the proportion given out by an insoluble salt depends upon its state of sub-division.

In the insoluble salts, most of the emanation is occluded by the salt itself; in compact form, the sulphate will only yield two and a half percent., while if it is finely powdered and divided, so that it presents a large surface, ten percent. can be obtained.

A uniform strength of emanation, is obtained when the same amount of radium sulphate, is held in the same state of sub-division, submerged in the same volume of water, for the same length of time.

If it is desired to prepare doses of one hundred Mache Units, and the sulphate can be held in such a state that ten percent. of its emanation is available (as is the case when distributed through porous terra cotta) it will be convenient to use an amount of radium which would yield two thousand Mache Units and submerge for four days in tightly closed containers, when one half of ten percent. or one hundred Mache Units will be obtained.

The stronger natural springs contain from one to two hundred Mache Units per liter, with which they are charged while flowing over radio-active minerals or passing through cavities where the emanation has collected. The reason why many mineral waters, when drunk at the springs, give therapeutic results unattainable when they are bottled and transported, is the speedy dissipation of the fugitive emanation, which is reduced to one half in four days unless there is a source for its renewal. The means of renewing the radio-activity of bottled waters or of charging any water with emanation, are afforded by the above-mentioned devices, and the physician may thus prescribe a course of treatment which can be carried out with precision in the patient's home.

The chief effect of the radiations from radium and its disintegration products, is to produce an ionization of the atoms of whatever substance the rays penetrate. Chemical effects follow as a secondary result of the ionization. Von Noorden and Falta say that, "in contradistinction to all other forms of electro-therapy, we possess in the radio-active substances a means of carrying electrical energy into the depths of the body, and there subjecting the juices, protoplasm and nuclei of the cells, to an immediate bombardment by explosions of electrical atoms. We may therefore designate this internal treatment with radio-active substances, internal electro-therapy.

DISCUSSION.

PROF. SAYRE:—What have been the therapeutical results obtained from the use of these radio-mineral waters; have they been of a very reliable character?

DR. SCHIEFFELIN:—I do not feel competent to answer that, but whenever sufficient results have been obtained to make a demand from physicians of standing, it is well for the pharmacists to be in a position to supply it. All kinds of claims are made, and a great many cases which have been treated have been brought to my attention, but not being a physician I hesitate to express an opinion. I am willing to mention if I may, some of the extraordinary

things not connected with medicine, that have come to my attention, in regard to the effects of this weakly charged radium water, upon plants, for example. They have tried the experiment of taking two plants of exactly the same kind, age, and size, with the same number of leaves, etc., and watering them with the same amount of water, and in the same kind of soil, etc., the only difference being that the water applied to one plant was charged with radium emanations, and at the end of ten days, the plant so treated was four times as big as the other one. There have been a great many experiments along this line, which have given some very interesting results. If you use a thousand Mache Units, you will wither the plant; if you give a man 10,000 Mache Units you do not seem to hurt him.

DR. RUSBY:—It may be interesting to you to know, that ever since last October I have been engaged in a systematic study of the effects of radium on crop production. I have charge of the observation of a farm of 130 acres at Northfield, near Cleveland. There we have five plots of each crop, and these plots receive different quantities of radium, one of the plots receiving no radium whatever. At the same time I am in direct charge of a small plot of an acre and a half at Nutley, New Jersey, near my home, and there I have had all these crops for experimentation. The results have been of the greatest interest and of the greatest importance. In the case of radishes I have secured an increase of 70 per cent. in the weight of the crops. One of the most interesting things was the result obtained with radishes grown under glass in the winter time, during February, when the amount of sunlight was very slight, because it was stormy during the whole month and there was snow on the glass during a large part of the time, excluding the sunlight. While the roots, the radishes themselves, increased 20 per cent. in weight, the tops, or the green parts, decreased 17 per cent., showing that the plant produced more food with less action of sunlight on leaf tissues.

A European investigator has shown that the amount of the starch in the plant in the morning was greater than it was the night before, under the influence of radium; the supposition has heretofore been that starch can form only in sunlight and is consumed in darkness. The experiment shows that radium causes starch production during the night, when the plant can not receive the rays of the sun.

Furthermore, in the same soil from which a crop has been taken, if a new crop is planted, without any additional amount of radium, the results are greater even than they were before, instead of being less.

As Dr. Schieffelin says, an excessive amount of radium emanation is injurious. Take, for instance, the amount of radium which produced an increase of 22 per cent. If that amount be increased four-fold, the crop is stunted, and will not grow at all; the plant will grow up two or three inches and has the appearance of having been poisoned, and a crop cannot be produced.

I have made an arrangement with the New York Times to publish in their paper about the first of October, an illustrated account of these operations, and if any of you want to watch for that, you can get it.

The experiments show that radium not only results in the practical improvement of agriculture, but that it acts on the protoplasm of animals in the same way that it does upon the protoplasm of plants.

I also want to say if any of you will write to the Standard Chemical Company of Pittsburgh they will send you a little pamphlet on terms used in the measurement of radium. It is a very good one and it shows how through a misunderstanding of terms, a lot of errors have crept in.

DR. SCHIEFFELIN:—I want to speak of one other thing, in the hope that somebody else will testify, Prof. Rusby himself, perhaps, and that is reported by the man who invented these terra cotta rods. They are just as good for charging the air with radium emanation as for charging water with it. One experiment was made of taking a couple hundred eggs, which were all supposed to be fertile, and putting one hundred in one incubator and one hundred in another; the air in one incubator was kept charged with radium emanation during the period of incubation. Otherwise both incubators were kept under ordinary conditions. Eighty of the eggs hatched in the radium-charged incubator, while only thirty-two of the eggs hatched in the other, and the chickens hatched in the incubator which was not charged with radium, were a half ounce lighter in weight than the chickens hatched in the other.

MR. RUSBY:—It is certainly true that the air can be charged with emanation, because it is on that principle that the electroscope, for measuring radium emanation, is based. It is because the air in the measuring instrument, is charged with radium emanation, that it becomes capable of conducting electricity and by such conduction the electroscope works.

DR. SCHIEFFELIN:—What the pharmacist should prepare for is to meet the demand on the part of the physicians. Since I have been interested in this subject a number of physicians have used these different emanators, and the demand appears greater at the present moment than the different companies are able to supply; as least, that is what I am informed. Now, that is going to be the real test. I have always said that anything that has to be sold, as a remedy, by advertising, does not belong in the *Materia Medica*, but the moment that physicians continue to repeat orders for a preparation, without it being constantly advertised,

it begins to look as though it had a permanent place in the *Materia Medica*. I think it is a little too soon to say anything definite about radio-active water, except that for centuries people have been taking treatment at Wildbad-Gastein springs, which contain radium emanation, with beneficial results, which ought to be an eloquent argument in favor of the treatment, with radium emanations, of gout, rheumatism, etc.

Baron Liebig, over 70 years ago, went to Gastein and took the treatment of the waters and was cured, and he said, "I am going to find out what is in that water that cured me," and he analyzed it, and took great pains in investigating it, but when he had finished, he said there was nothing in the water that chemistry at that time could detect, but that there must be something, some influence, some magnetic, or electrical influence, which causes this wonderful power in the water. And he was right, because this power is not chemical, it is electric. These little alpha particles have two positive charges of electricity to each helium atom, and they are volleyed out like volleys from a battleship, constantly at the rate of 136 millions per second from a milligram of radium. We cannot get around that; that has been shown, and if you get some of them inside of you, it is not surprising if they produce some effect.

MR. JOSEPH WEINSTEIN, of New York:—How do the European mineral waters compare with the domestic mineral waters, as to being charged with emanation, say Saratoga Springs?

DR. SCHIEFFELIN:—They have a little, but have not been found to be very strongly radio-active.

MR. WEINSTEIN:—So that they do not compare at all with the European springs?

DR. SCHIEFFELIN:—A lot of them are very weak. I think Saratoga Springs are only faintly radio-active. The Hot Springs of Arkansas are radio-active. All springs are more or less radio-active, but most of them are very weak.

MR. WEINSTEIN:—Are the Hot Springs, of Virginia, radio-active?

DR. SCHIEFFELIN:—Yes.

DR. WOLFF:—The Bureau of Standards will soon be ready to provide a standard radium content. That matter is receiving attention now, and we have also been considering radium preparations, and the Bureau has some of the official copies of the radium standards which have gained international recognition.

DR. SCHIEFFELIN:—Will we be able to get these?

DR. WOLFF:—I think so, shortly.

DR. SCHIEFFELIN:—I am glad to hear that. These emanators have been loaned by the manufacturers in the porous earthenware cups (indicating) and within that are the holders that contain the sulphate of radium. I am sorry to have to take this away, but I have another appointment in the evening and I will soon have to leave.

MR. JOSEPH FEIL, of Cleveland:—I would like to get a description of that arrangement again. You say the radium is kept in a tube, which has an opening at the end, or how is that arranged?

DR. SCHIEFFELIN:—There is another tube beyond the orifice, with vacuum too. The other tube is a brass tube, and that is where the electrical connection occurs; you know if you connect two conductors with an electrical battery and bring them together a spark will jump across. That is the principle upon which that works. The little helium atom, charged with two charges of electricity closes the circuit and makes a very delicate electrometer give a little jerk.

MR. JOHN K. THUM, of Philadelphia:—Dr. Schieffelin says there are some things which he would rather not talk about, which I think should be talked about. His remarks about the statement made by the physician who claims that the taking of the soluble radium salt may produce cancer, as he said the experiments have shown, show that there is a great possibility of this being true, and if so, it would be a great danger to the public.

There seems to be a strange silence on the part of the leaders of surgical science as to the value of radium in the treatment of cancer. And from private conversations with physicians one is led to believe that in some cases where radium has been applied to cancer patients, there seemed to have been at first an improvement, but that subsequently the patients died, three, six months, or a year later, with a diffused carcinomatous condition. So therefore there is a possibility that the application of radium may be dangerous, not only in applying it to the carcinoma, but by drinking it in water. If these radium waters are to become matters of commerce, there should be some regulation or control. It seems to me that radium ought to be more thoroughly understood, and there should be something done to see that the emanations alone are in the water, and not soluble salts. The public should be protected at all costs.

A MEMBER:—The theory that radium might cause cancer has been experimentally disproved. There is no longer any ground for devoting any attention to that. The British Medical Association at its meeting decided that it was time the medical profession and the public should know that in cases of superficial cancer, where the cancers are in places where they can be reached, the only appropriate treatment is the radium treatment. Furthermore

the British Medical Association decided that the use of surgery in fighting cancer was a thing of the past. That is the last announcement which has been made.

DR. SCHIEFFELIN:—I will pass around some of these things for your inspection. These are the earthenware rods, and this is a sample of pitchblende, an extremely handsome sample. You can determine it from its looks, and also from its weight. Uranium is one of the heaviest of all the elements, and for millions of years this uranium has been breaking down to form radium, and this radium is breaking down to form a new element. It is something that we never dreamed of. It is really a transmutation.

This little terra cotta rod does not contain the radium as a little lump, but the radium is distributed all the way through it. Before the rod is made the radium is dispersed through a powder and mixed with the clay, and then the rod is baked.

I wanted to speak about the best authors on radio-activity at the present time. These books (indicating) are very recent. This book is by Paul Lazarus, and is a collection of the best papers on the therapeutic effect of radium.

This book is Soddy's "Interpretation of Radium," which was printed a year ago; and of course, the classic book is Madam Curie's work in two large volumes, which I do not have here.

The last book of all is "Radio-active Substances and their Radiations" by Sir Ernest Rutherford, who did much of his work at McGill University, Canada. This book has gone through a number of editions, and this is the 1913 Edition, and every page is full of important data and reasoning, and there are 664 pages in the book. It is only since 1901, that they have been doing much on this subject. These gases and elements are very recent ones, and yet we know as much, if not more, about their properties, as we do of some of the elements that have been known for a hundred years.

I neglected to call your attention to these tables (indicating charts on wall). The Curie is the regular standard, and that is the amount of emanation that is given off by a gram of radium. Now, this table shows how very small a Mache unit is because it takes 2700 mache units to make a microcurie.

(Table above referred to.)

Curie	Millicurie	Microcurie	Mache Units
1	1000	1000000	2700 millions
0.001	1	1000	2700000
0.000001	0.001	1	2700
0.00000000037	0.00000037	0.00037	1

DR. SCHIEFFELIN:—I would also like to call your attention to this table, showing the strength of various springs in Europe:

RADIO-ACTIVE STRENGTH OF NATURAL SPRING WATERS MEASURED IN MACHE UNITS PER LITER.

Place.	Name of Spring.	M. U.	Author.
Gastein	Rudolph Stollen	24.7	H. Mache
Gastein	Elisabetquelle, N. Q.	26.8	H. Mache
Gastein	Doctorquelle	31.5	H. Mache
Gastein	Fledermausstollen	32.8	H. Mache
Gastein	Chirurgenquelle	54.5	H. Mache
Gastein	Franz Joseph Stollen, V. Q.	61.7	H. Mache
Gastein	Franz Joseph Stollen, H. Q.	64.5	H. Mache
Gastein	Elisabet Stollen, S. Q.	73.7	H. Mache

NOTES ON THE ESTIMATION OF MORPHINE AND ON LLOYD'S REAGENT.

H. M. GORDIN AND J. KAPLAN.

1. *Attempt to shake out morphine with a mixture of alcohol and chloroform from a saturated solution of potassium carbonate.*

When a saturated solution of potassium carbonate is shaken with alcohol or a mixture of equal volumes of alcohol and chloroform, most of the alcoholic solvent very quickly separates out on the surface of the heavier aqueous layer. This was proved by adding a definite volume of the alcoholic liquid to an equal volume of the saturated solution of potassium carbonate, shaking the mixture vigorously, and reading off the volume of the upper layer after the liquid has separated in two layers. In all cases the volume of the alcoholic layer was only a little less than the volume of the alcoholic liquid originally taken.

Owing to there being no good immiscible solvent for the extraction of morphine from the solution of its salts in water, an attempt was made to saturate such a solution with potassium carbonate, and to use a mixture of equal volumes of alcohol and chloroform as an immiscible solvent. The aqueous liquid, after being shaken once with an equal volume of the alcoholic liquid, using about 40 cc. of each for about 0.1 g. of morphine in the form of salt, gave no test, in acidified solution, with Mayer's or Wagner's reagent, while, on the other hand, the alcoholic liquid was found to contain, besides morphine, small amounts of potassium carbonate, together with small amounts of other substances, coming either from impurities in the carbonate, or from a partial decomposition of morphine by the latter, or from both sources. Even when the potassium carbonate was previously washed with alcohol and dried, the alcohol-chloroform-solution of the morphine contained small amounts of other substances.

It was thought that by washing the residue left, (after distilling off the alcoholic liquid from the morphine), with a saturated solution of the alkaloid, the impurities could be eliminated, so that the morphine could be determined alkalimetrically. For this purpose, definite amounts of morphine were dissolved in acidified water, the solution saturated with potassium carbonate, (either ordinary or previously washed with alcohol), and then shaken with a definite volume of a mixture of equal volumes of alcohol and chloroform. After the complete separation of the liquid into two layers, an aliquot portion of the upper alcoholic layer was drawn off and evaporated to dryness. The residue was washed, with a saturated solution of morphine in water, until the washings gave no test for potassium carbonate with phenolphthalein, and the morphine determined alkalimetrically, using N/25, H_2SO_4 and N/50, KOH. The indicator was methyl-red.

The experiments showed that, in all cases, the amount of morphine found, ex-

ceeded the amount originally taken, the variation being from two to fifteen percent. Hence the method, at least in the form here described, is not reliable.

2. *Extraction of alkaloids by means of Lloyd's reagent.*

Owing to the facility and completeness of precipitation of alkaloids by Lloyd's reagent, it was thought that this reagent could be advantageously used for the quantitative extraction of alkaloids from their original sources or from the solution of their salts in water.

It is evident that, in order to attain this aim, it is necessary to prove that the alkaloids, once precipitated by Lloyd's reagent, can be readily and completely recovered from the precipitate containing alkaloid and reagent. With a view of determining this point, the following experiments were carried out:

A definite amount of morphine was dissolved in an excess of dilute sulfuric acid, the alkaloid completely precipitated with an excess of Lloyd's reagent, and the precipitate then washed with water until the washings gave no test for sulfuric acid. The precipitate was dried at 60° and then repeatedly extracted with boiling methyl alcohol, which is a very fair solvent for morphine. The solution was evaporated to dryness, and the residue weighed. This residue was free of sulfuric acid, showing it to contain probably free morphine, but its amount was less than 4 percent. of the morphine originally taken.

The precipitate was again extracted with methyl alcohol to which a small amount of ammonia had been added, and after again evaporating the solvent the residue was weighed. The total amount of alkaloid recovered by the two successive extractions, was about 90 percent. of the morphine taken.

Another experiment was made with strychnine, using chloroform which is an exceptionally good solvent for this alkaloid. A dilute solution of strychnine in water acidified with sulfuric acid, was completely precipitated with an excess of Lloyd's reagent, and the precipitate, after thorough washing with water, dried at 60°. A portion of the precipitate containing about 0.2 g. of strychnine was suspended in a little water containing an excess of ammonia, and then repeatedly shaken out with successive portions of chloroform, using 20 cc. of the latter for the first shaking and 15 cc. each time afterwards. It was found that, even after ten consecutive operations, the chloroform did not remove all of the alkaloid, as was shown by evaporating some of the chloroformic extract to dryness, taking up the residue with acidified water, and testing the resulting solution with Mayer's and Wagner's reagents, both of which continued to give a heavy precipitate. Hence, by this method, it is extremely difficult, quantitatively, to recover the strychnine from a solution of its salts in water. Whether other methods would be more successful, will have to be determined by further experimentation.

3. *Attempt to facilitate the removal of strychnine from the precipitate obtained by adding Lloyd's reagent to a solution of a salt of the alkaloid in water.*

The precipitate obtained by adding an excess of Lloyd's reagent to an aqueous solution of a salt of strychnine, is almost perfectly tasteless, though it contains all of the alkaloid of the original solution. This seems to suggest the view that the reagent forms with the alkaloid, an exceptionally stable combination, and this

view is further strengthened by the fact that, as was shown above, it is extremely difficult to completely recover the alkaloid from the precipitate.

On the other hand, as will be reported later by Dr. McGuigan, the precipitate acts physiologically very much like strychnine diluted with an inactive substance, showing that, in the living digestive apparatus, the union of alkaloid and reagent is readily disrupted. Since it was reasonable to ascribe this disrupting effect to the digestive enzymes of the animal body, experiments were made, in order to determine whether some of these enzymes would show the same disrupting effect *in vitro*. If this were so, dilute hydrochloric acid in presence of pepsin, or chloroform in presence of alkali and either ptyalin or trypsin, readily ought to extract the strychnine from the precipitate. The following experiments were, therefore, carried out with these enzymes:

Pepsin. The thoroughly washed and dried precipitate obtained by adding an excess of Lloyd's reagent to an aqueous solution of strychnine sulphate, was digested with very dilute hydrochloric acid containing a little pepsin, shaking the mixture for an hour and then filtering. The filtrate was tested with Mayer's and Wagner's reagents. Neither of these gave any indication of the presence of an alkaloid. Hence *in vitro* pepsin has no disrupting effect on the precipitate.

Ptyalin and trypsin. The precipitate was suspended in a very dilute solution of ammonia containing either ptyalin or trypsin, and the mixture repeatedly shaken out with chloroform. It was found that, even after ten successive treatments with chloroform, the precipitate still retained some of the strychnine. Hence these enzymes, too, have no disrupting effect on the precipitate.

OIL OF BIRCH AND METHYL SALICYLATE,—SOME NEW COLOR-REACTIONS FOR THE DIFFERENTIATION OF OIL OF WINTERGREEN.

BY G. N. WATSON AND L. E. SAYRE.

Anyone who has had experience with oil of wintergreen and the synthetic oil, knows of the uncertainty connected with their identification and differentiation. The physical constants, with one exception, appear to be of little value in distinguishing the true from the artificial oil. We have the authority of C. L. Alsberg that at present, except for the one test—the presence or absence of optical activity,—there has been nothing published which would enable one to make the differentiation, and that this polarization method is only a very important factor to this end. During the past winter, at the drug laboratory, we have had occasion to examine several samples of oil of wintergreen, which brought to our attention the desirability of confirmatory tests. After numerous attempts to fix upon one, it was finally decided that rotatory power of the natural oil was perhaps the only distinguishing characteristic. Admixture with corresponding oils, such as betula and methyl salicylate, being suspected by any great digression of optical activity. Recently I have used some color-reactions which seems to promise excellent re-

sults. These reactions (color-tests) are presented at this section for critical discussion:

An excess of sulphuric acid gives, with the natural oil, a dark red color. The reagent produces no color with the synthetic oil. With oil of birch, a yellow or light shade of red is produced.*

For a confirmatory test, an alcoholic solution of heliotropin and sulphuric acid makes a good reagent. To a few drops of the oil add 2 cc. of concentrated sulphuric acid and two drops of a saturated alcoholic solution of heliotropin. This reagent gives, with the natural oil, a crimson color, changing to deep violet upon dilution with alcohol. Oil of birch gives practically the same color, but not so pronounced. With the synthetic oil the reagent produces a bright yellow color, due, however, to the action of the acid on the heliotropin and not to any action on the oil.

A second confirmatory reagent, and one superior to heliotropin, since it differentiates the oil of wintergreen and oil of birch, is an aqueous solution of chloral hydrate and sulphuric acid. To 1 cc. of the oil in a test tube add 2 cc. of concentrated sulphuric acid, then 1 cc. of a saturated aqueous solution of chloral hydrate. With the natural oil a green color develops, a dark green oil-layer above a lighter green aqueous zone. The addition of 2 or 3 cc. of water aids in bringing out these shades. Oil of birch gives a deep violet oil-layer. The synthetic produces no color except after long standing, when a faint violet color may develop.

DISCUSSION.

DR. ENGLEHARDT: I would like to ask a question. What percentage of synthetic oil of wintergreen in natural oil can be detected by this method?

A method said to be used by the Government for distinguishing synthetic oil of wintergreen from natural oil or detecting adulterations of the latter with the former, seems to be a process similar to that which has already been used for distinguishing synthetic camphor from natural camphor. The method depends on the presence of mechanical admixtures in natural camphor by which a certain color reaction is produced. It was interesting to know whether or not the reaction with natural oil of wintergreen is also due to certain admixtures in the oil which cannot be eliminated in the usual process of rectifying. In order to find this out I began the following experiments. Eight ounces of synthetic oil of wintergreen were mixed with one pound of wintergreen leaves in the one case, and in another case with one pound of birch bark. The mixtures were then distilled with steam and the resulting oil, which should amount to about 8.1 ounces I expect to subject to the vanillin hydrochloric acid or vanillin sulphuric acid tests. On account of lack of time I have not been able to complete these tests. If the tests for natural oil should prove to be positive, the test is without doubt fallacious, since the material taken for preparing the oil consisted almost altogether of synthetic oil.

MR. ASHER:—I would like to say in this connection that Professor LaWall, two or three years ago in the American Journal of Pharmacy endeavored to give the points of distinction between natural oil and synthetic oil. He made quite an exhaustive investigation of that subject.

MR. RAUBENHEIMER:—Besides the optical rotation and the slight difference in color, there is a very simple test to distinguish between the natural Oil of Wintergreen and the synthetic methyl salicylate. It is a physical test and depends upon the peculiarity that, when oil of wintergreen is agitated in a bottle it will produce a foam which will be retained for some time. If on the other hand, methyl salicylate is agitated the same way, it will produce no froth. Nevertheless it should be remembered that even this test can be "faked up" very easily (laughter).

MR. BRIGGS:—These two oils can be tested very easily, by odor. Any one who is accustomed to examining the natural oil, and comparing it, with the artificial oil, will detect a fine delicate aroma in the natural oil that it is almost impossible to put in the artificial oil.

*Some authorities have referred to sulphuric acid as a reagent which increases temperature with the true oil, not so with artificial oil.

OFFICIAL AND OTHER TINCTURES.

M. I. WILBERT, PH. D.

Tinctures have been variously defined, but all attempts to differentiate them, clearly, from other galenical preparations, by a concise restrictive description have failed, because of the necessary exceptions that are involved in any now-available list of official tinctures.

Broadly speaking, they may be designated as hydro-alcoholic solutions of organic, or of inorganic, principles used as medicine or, perhaps even better, as alcohol containing solutions of medicinal substances.

For many years tinctures held the leading place in galenical pharmacy, because of the fact that they represented perhaps the most efficient and most acceptable mode for the administration of the medicinally active constituents of vegetable drugs. It is safe to say, however, that tinctures no longer occupy the preponderating position accorded them two or three decades since, despite the fact that they may be made to represent, in rather a fairly concentrated form, all of the active principles of the drugs from which they are made and are, on the whole, the most stable and most reliable of all fluid preparations of vegetable drugs.

The reasons for the gradual disuse of tinctures are, no doubt, many and varied. Not the least important of these reasons, however, is the fact that, as dispensed at the present time, they are far from being uniformly reliable and, very frequently indeed, physicians using them fail to obtain the desired results.

This failure of a tincture to induce the medicinal action expected of it, or, as sometimes happens, its causation of a secondary or untoward action, may be due to a number of factors, of which I desire to call your attention to but two:—the variability of tinctures of potent drugs, owing to the menstruum employed in their manufacture and the generally objectionable nature of tinctures in which alcohol is the preponderating active ingredient.

Up to the time of the publication of the eighth decennial revision of the Pharmacopœia of the United States, less than a decade ago, no concerted attempt had ever been made on the part of the pharmacopœial revision committees of different countries, to bring about any degree of uniformity in the drug-strength of tinctures, or in the composition of other medicinal substances.

Continued agitation, for a period of half a century or more, by men interested in the improvement of galenical pharmacy, has finally resulted in the development of a marked degree of uniformity in the tinctures of widely-used potent drugs, so that with the publication of the new British Pharmacopœia, these preparations will be practically uniform in every country of the civilized world.

The first International Pharmaceutical Congress held in Brunswick, Germany, in 1865, was called together at the instigation of French and of German pharmacists, who, in 1864, just 50 years ago, began to discuss the practicability of securing some manner of agreement to bring about greater uniformity in the strength of pharmaceutical preparations of potent drugs. In some more or less modified form, the same problem was the basis for discussions at succeeding International Congresses and at the Fifth Congress, held in London in 1881,

Peter Squire outlined a definite and reasonable proposition, for the equalization of the strength of pharmaceutical preparations included in the pharmacopœias of the different countries. He specifically called attention to the very marked differences in the strength of potent tinctures in the several pharmacopœias, and suggested the desirability of making them uniform.

It was not, however, until 1901, that a definite plan of action was found acceptable to the majority of representatives of the different countries, and this plan was later developed at the Brussels Conference held in 1902, and finally put into operation through the international treaty signed by representatives of the several powers, in Brussels in 1906.

Unfortunately, the revisers of our own Pharmacopœia of the United States, because of the inherent conservatism of American pharmacists, have failed to take advantage of perhaps the most important suggestion made in connection with the tinctures included in the Brussels Conference Protocol; that is, the suggestion to use approximately 70 percent. alcohol, in place of the 45 or 50 percent. alcohol as a menstruum.

In a paper reporting a series of experiments on the practicability of adopting the suggestions embodied in the Brussels Conference Protocol, reported in the American Journal of Pharmacy for 1903 (p. 2027), I called attention to the desirability of using the higher strength alcohol and enumerated among other advantages of the international standard menstruum:

That the menstruum used would be uniform in strength for all extractive tinctures of potent drugs.

That the 70 percent. alcohol readily extracts all of the active properties of the drug, while the total extract-content of the resulting preparation is distinctly lower.

That the keeping qualities of the preparation would be greatly improved by the increase in alcohol-content.

That the resulting preparations were elegant in appearance and promised to be quite permanent.

In a discussion on the relative compliance of the various pharmacopœias with the protocol of the Brussels Conference, read at the Richmond meeting of the American Pharmaceutical Association, (Proc. Am. Pharm. Assoc., 1910, v. 58, p. 1145), I reported that the tinctures made in 1902 were still clear and evidently satisfactory, while corresponding preparations made with the U. S. P. VII menstruum of diluted alcohol had generally precipitated badly. I also called attention to the fact that, approximately, 70 percent. of alcohol was then recognized as being a much more efficient antiseptic and preservative than either the more dilute or more concentrated mixtures of alcohol and water and that this one property of 70 percent. alcohol alone, should warrant its careful consideration on the part of the U. S. P. Committee of Revision for adoption as a routine menstruum in place of the diluted alcohol now generally prescribed.

What was said of the preparations four years ago still holds good, with the addition that both the color and odor of the tinctures made with 70 percent. alcohol are as characteristic of the drug now as then. This is particularly true of the tinctures of the leaf drugs, which still retain their original green color, while the

preparations made with 50 percent. alcohol long since became muddy, dark and brown.

The economic reasons that have induced American pharmacists to adopt and to adhere so tenaciously to the use of the weaker alcoholic menstruum are not of sufficient importance to warrant the continuance of the use of the weaker menstruum when the medicinal activity of a preparation is at stake.

Uniformity in the activity of the heart tonic group of drugs, particularly, is a matter of considerable importance because of the fact that, in connection with these drugs, we have no active principles that adequately serve as substitutes for the galenical preparation. Digitalis, more especially, is a drug that offers difficulties in this direction and a recently published paper by H. C. Hamilton (*Am. J. Pharm.*, 1914, v. 86, p. 56-61) emphasizes the desirability of materially increasing the alcohol-content of the menstruum used for extracting this drug and presents data that shows the imperative need for an increase in the alcoholic strength of the menstruum. A preparation reported on by Worth Hale in 1911, (*Hyg. Lab. Bull.*, No. 74) bears out the same contention.

What is true of digitalis is also true of belladonna, hyoscyamus, nux vomica, colchicum and other potent drugs. The tinctures made with 70 percent. alcohol have uniformly demonstrated better-keeping qualities than have the preparations made with dilute alcohol and while, at this late date, it may be impractical to reverse any decision made by the Committee of Revision, it is to be hoped that a sufficient number of pharmacists will interest themselves in the subject to at once prepare a line of international standard tinctures with 70 percent. alcohol, and to preserve them for a decade, in comparison with the preparations made according to pharmacopœial directions and report on them in time for the succeeding revision.

One other feature of considerable importance to pharmacists who expect to practice their profession in years to come, is the retention in the Pharmacopœia of preparations that can be or are being used in prohibition-territory as "tipples." The existing Federal statutes and the regulations based on the internal revenue tax laws, adequately define the limitations of the use of alcohol for medicinal purposes, and recent Treasury decisions clearly indicate that, in the course of time, preparations included in the Pharmacopœia and in the National Formulary, must be subjected to the same critical scrutiny that is now accorded to proprietary remedies marketed for sale as medicines.

Of the 58 tinctures now official in the Pharmacopœia of the United States, not more than 25 are at all widely used and of these 25, at least 4 could be spared. One of the more objectionable of these preparations is Tincture of Ginger, which has acquired a very widespread reputation as a "tipple" and has few or no legitimate uses as a medicine.

One other factor in connection with tinctures, that should be taken into consideration at this time, is the possibility of developing a line of simple extractive preparations of opium that cannot be used in place of smoking-opium. A recent Treasury decision even now classifies the formerly official aqueous extract of opium as smoking-opium and it is quite probable that it will presently be found necessary to include in this classification, the now widely used simple tinctures

of that drug, unless ways and means can be found to restrict the sale of these preparations for use as legitimate medicine.

In conclusion I wish to reiterate the statement that the international standard menstruum of 70 percent. alcohol, is more satisfactory as a solvent for the active constituents of potent drugs than is 50 percent. alcohol. The resulting tinctures retain their appearance and activity for a much longer period of time. So that quite apart from the question of efficiency, they are in reality more economical.

Alcohol-containing preparations that can be or are used as substitutes for alcoholic beverages, should be deleted from future revisions of the Pharmacopœia and the sale and distribution of preparations that are in any way subject to misuse or abuse should be safeguarded in a thoroughly efficient manner.

DISCUSSION.

MR. GORDON: In support of Mr. Wilbert's suggestion that a stronger alcohol would be better for extracting and preserving the active principles of plant drugs, I would cite the practice of the Homeopathic Pharmacopœia, which uses strong alcohol menstrua for extracting the active principles of plants and a weaker alcohol for dilutions. Experience has proven in this school, that strong alcohol is most efficient for preserving the strong tinctures of vegetable drugs, the dilutions of the strong, or "mother tinctures" being made with an alcohol of weaker strength. The so-called "strong alcohol" corresponds with the 95 per cent. alcohol of the U. S. P., the "dispensing alcohol" is about 88 per cent. absolute alcohol, weaker alcoholic dilutions are used for special preparations. In making tinctures of fresh vegetable drugs the normal amount, or proportion, of moisture is always considered as a part of the menstruum used for extraction.

MR. WM. P. KIRCHGESSNER, of Grand Rapids, Michigan:—Do I understand that by this method the content of moisture of a plant is taken as being 25 per cent.?

MR. GORDON:—Oh, no, the content of moisture in the fresh, green plant from which many homeopathic preparations are made is carefully determined in the following manner: A weighed quantity of the drug is carefully dried, powdering it if necessary at the latter stage, and the amount of plant moisture contained is then determined by the difference between the weight of the fresh drug taken and the dried product. This moisture is, of course, the natural water in the juices of the fresh drug, and it is taken as part of the menstruum used for extracting the active principles of the plant. For example, suppose we were making the "mother tincture" of aconite, the term "mother tincture" being used to denote the strongest tincture made from the drug for further dilution as required. The directions of the Homeopathic Pharmacopœia, we will say, call for a menstruum consisting of 700 parts of alcohol and 300 parts of water. If the fresh, succulent plant is used, the amount of water contained in the fresh leaves would be estimated as just mentioned and that water taken as part of the menstruum used for extraction. Say the leaves contained 20 per cent. of moisture, then to make a tincture of aconite the following proportion would be observed: Alcohol—700 parts, water—100 parts, plant moisture—200 parts, to make 1000 parts of tincture. It must be understood that more of such menstruum will be required to make the final product an exact ten per cent. tincture, but little menstruum is wasted if the drug is exhausted slowly and the marc expressed. Of course in case of a dried drug, the proportion of water does not amount to much and is usually disregarded, unless in cases where it exceeds a certain percentage, I think it is about five per cent., but for tinctures of fresh drugs the moisture is invariably calculated.

MR. KIRCHGESSNER:—I understand the homeopathic school has two pharmacopœias. Which is used?

MR. GORDON:—There is only one official homeopathic Pharmacopœia, that issued under the auspices of the American Institute of Homeopathy, an association of homeopathic physicians which corresponds to the American Medical Association in relation to the two schools of medical practice. However, several different pharmacopœias have been published, just as have different Dispensatories, but all are based on the homeopathic list of drugs recognized by this school. I have prepared a brief history of the evolution of the homeopathic pharmacopœia of the present day which I have presented to the Historical Section, in which I hope the answer to this question will be found. In the early history of homeopathy in this country many of the text books were translations of foreign works, the firm of Boericke and Taefel leading in this enterprise. That is where the confusion may arise, just as if you were to ask me which is the official Dispensatory. Now, the official pharmacopœia is the "Homeopathic Pharmacopœia of the United States," issued under the sanction of the American Institute of Homeopathy, but any physician is of course privileged to use any book of reference and to prescribe as he sees fit. The last edition was published in 1914.

after revision by a committee of physicians and pharmacists of the homeopathic school. Radium emanations just spoken of as being effective in such small doses remind me of being near akin to homeopathy.

MR. W. JAY SCHIEFFELIN, JR., of New York:—Referring to radium, it seems to me that when we are considering minute doses, that radium water, or emanation water, ought to be put in the homeopathic pharmacopoeia.

MR. GORDON:—The use of radium in homeopathic hospitals is common. I know of one that has at least \$50,000.00 worth.

MR. SCHIEFFELIN:—I remember years ago hearing a receipt for homeopathic punch. You take a little rum, the less you take the better, drop it in the lakes of Wenner and of Wetter. You stir the mixture well, lest it prove inferior, and put one drop of it into Lake Superior. Stir again and then lest it makes you groggy, you place one drop of it into Lake Winnepe-saukee, and then every other day you take a drop of that in water. That will make you well, or at least it ought to. (Laughter.)

When you take the mother tincture and make it up to a sixtieth or one hundred and twentieth potency, you actually dilute it as much as the punch. An atom of helium is very minute. An atom of helium is to a drop of water as is a walnut in size to the globe. So you can see what there is in small doses.

MR. GORDON:—I can beat that. One of the old tests as to the truth of Homeopathy was the following: Put one teaspoonful of whiskey into a bucket full of water and give an old sailor teaspoonful doses of the dilution until you got him drunk. I have seen it tried, but there was too much water to suit the sailor. (Laughter.) He takes his straight. But to be serious, I have had the privilege of studying a little into the doctrines of Hahnemann, and I am surprised how near he came to our own modern doctrines. We boast of our vaccines and prophylactic serums; what are they but an exemplification of Hahnemann's famous doctrine "Like cures like"? We give the same germs that caused the disease, to cure it. Take the theory of dilution of drugs. It is but the ionic theory in embryo. The homeopathic school does not teach that the weaker a drug is the more powerful it is, just the contrary. The basis of its teachings is that a drug in a finely divided state, dilutions or triturations, is more active than when in mass. Is not that the ionic theory? Does sodium chloride as NaCl exert any chemical action until it is disassociated by solution in water into sodium and chlorine ions?

PROF. L. E. SAYRE, of Lawrence, Kansas:—How about those substances which do not ionize? Do they act?

MR. GORDON:—Not to be ironical I answer yes, just as a flatiron does when applied to the head. How, I don't know from experience.

NOTES ON THE ANALYSIS OF SOME ESSENTIAL OILS.

FRANCIS D. DODGE.

1. *Detection of Pinene in Oil of Lemon.*

To demonstrate the presence of pinene among the terpenes of oil of lemon, or of similar oils, reliance is generally placed on the well-known nitroso-chloride reaction, the crystalline product being identified by its melting point, or the melting point of nitrolamine derivative. As a rule, however, a mixture of nitroso-chlorides is obtained, and the recognition of the pinene derivative is attended with some uncertainty. We have found it convenient, for this purpose, to utilize the reaction of the nitroso-chloride with anilin.

Wallach (Ann. 252, 132) has shown that pinene nitroso-chloride, on heating with anilin, regenerates pinene, with formation of amido-azo-benzene:

whereas limonene nitroso-chloride passes under similar conditions, into a nitrol-anilide:

The reaction thus effects a most satisfactory separation of these terpenes, pinene being isolated as such, in convenient shape for further tests if necessary.

Unfortunately, the method, like all based on the nitroso-chloride reaction, has only a qualitative value, for the yield of nitroso-chloride depends largely on the rotation of the pinene, being greatest from the inactive variety, and little, if any, being obtainable from pinene of high rotation, whether dextro- or lævo; and in cases where turpentine oil may have been added to oil of lemon, it is reasonable to suppose that a highly dextro variety would be selected.

In many cases, however, we have obtained positive results by operating as follows:

100 cc. of oil are fractioned very slowly from a three-bulb Ladenburg flask, collecting the first 10 cc. This distillate is then mixed with 10 cc. glacial acetic acid and 10 cc. ethyl nitrite, in a freezing-mixture. 3 cc. 25% hydrochloric acid is now slowly added, and the mixture allowed to crystallize for several hours in the cold. The nitroso-chloride is then filtered off, washed with cold methyl alcohol, and dried. The crystals are now mixed with three times their weight of re-distilled, colorless aniline, and eight times their weight of 95% alcohol, in a small flask, and heated gently on the water-bath. A rather vigorous reaction generally ensues. In the absence of pinene, the solution remains light colored: with pinene, it darkens very noticeably.

After one half-hour, 25 cc. water are added, and steam is passed through the flask. Pinene, if present, distils with a little aniline: the latter is dissolved by addition of a little dilute acetic or hydrochloric acid, and the pinene remains as insoluble light oil, recognizable by its odor.

The limit of sensibility of this method, appears to be at about 10% turpentine in lemon or orange oil. By more careful fractionation of larger amounts of oil, the delicacy of the test could no doubt be increased.

2. *Detection of Chlorine in Benzaldehyde and Oil Bitter Almond.*

The occurrence of *minute* traces of chlorinated compounds in commercial benzaldehyde, can hardly be considered of much importance, but in the case of oil of bitter almond, natural or freed from hydrocyanic acid, the detection of *any* chlorine is *prima facie* evidence of the presence of artificial benzaldehyde. Hence, any method of increasing the delicacy and certainty of the test becomes of interest.

We have obtained very satisfactory results by the following modification of the well known combustion process.

A circular filter paper, about four inches in diameter (as free from chlorides as possible), is placed in a suitable funnel, and washed completely chlorine-free with distilled water. 25 cc. of this filtrate are set aside as *Blank No. 1*. Fifteen drops of an oil, known to be chlorine-free, are then placed on a small, folded, chlorine-free filter, ignited (as in the U. S. P. method) and covered with the wet filter and funnel. The combustion is regulated by raising or lowering the funnel, as may be necessary.

When all the oil has been burnt, the funnel is inverted, and carefully washed with distilled water until about 25 cc. have run through.

This is *Blank No. 2*. The combustion is then repeated with the sample of oil in question, using the same filter and funnel, which then, on washing, yield 25 cc. of test filtrate. The three filtrates are then treated with five drops of n/10 silver nitrate, and the presence or absence of turbidity or opalescence noted.

By making two blank experiments in this way, a possible accidental contamination with chlorides, would be immediately noticed.

In doubtful cases, we have found that the delicacy of the reaction, is increased by exposing the tubes to direct sunlight, when the presence of a trace of chloride, is shown by a brown coloration. This is evidently due to a "photo-reduction" of the silver chloride by some organic product of combustion.

We have noticed that samples of benzaldehyde which show chlorine by the combustion test, will, also often, give indications of the chlorine *ion* by simple washing with water, and addition of silver nitrate to the clear aqueous extract. For example, a sample, supposed to be the natural oil, freed from hydrocyanic acid, (S. G. 1.0433 at 25°), showed chlorine on combustion, and by the sodium-reduction assay, contained 0.03% Cl.

25 cc. were washed with 25 cc. water; the latter, decanted, and warmed until clear, gave a decided opalescence with a few drop of silver solution.

The washing was repeated until no further chlorine *ion* could be detected, but, by combustion, the oil still showed unmistakable traces of chlorine. It was thought that this water-soluble chlorine, might be due to traces of salt, derived possibly from sodium sulphate, used for drying the oil. This appeared, however, not to be the case, for, on washing the oil with water, and evaporating the latter to dryness, a very slight residue, apparently benzoic acid, was left, in which *no* chlorine *ion* could be detected.

A portion of the same oil, was then shaken with an excess of dilute caustic soda, and carefully distilled with steam. The distilled oil showed chlorine by combustion, but *not* by simple washing. It was allowed to stand for nine months, with an equal volume of water, in a closed bottle, exposed to diffused light. The aqueous solution showed now the presence of chlorine *ions*.

It is evident that the chlorinated derivatives, contaminating benzaldehyde made from benzyl or benzal chloride, undergo a gradual decomposition, with liberation of hydrochloric acid. A similar behavior has been observed with various benzyl ethers and esters, which are not readily obtained free from chlorine.

For the quantitative determination of chlorine, we have employed the sodium-reduction method, in the following form:

10 grams oil are dissolved in 50 cc. absolute alcohol, and 2.5 grams clean sodium added, in small pieces. When the mixture becomes pasty, 25 cc. more alcohol are gradually added. When all the sodium is dissolved 100 cc. water are added, and the mixture evaporated to about 50 cc. A slight excess of *pure* dilute sulphuric acid is run in, the solution chilled, filtered through a wet filter, and the crystalline residue washed free from chlorine. The combined filtrate and washings are now exactly neutralized with $n/2$ potassium hydroxide, noting the amount used and titrated with $n/10$ silver nitrate, applying a correction for chlorine in the potassium hydroxide, if necessary.

Examples. Sample A. S. G. 1.0433 @ 25°, 10.046 gms., req. 0.8 cc. AgNO_3 (0.03% Cl).
Sample B, S. G. 1.044 10.04 gms. req. 1.22 cc. AgNO_3 (0.04%).
Sample C, S. G. 1.043 10.03 gms. req. 0.53 cc. AgNO_3 (0.02%).
Sample D, S. G. 1.046 10.50 gms. req. 11.9 cc. AgNO_3 (0.39%).
Sample E, (Natural oil, freed from hydrocyanic acid, old). 10.00 gms. req. 0.1 cc. AgNO_3 (0.0035%).

This sample contained about 8% benzoic acid; the amount of chlorine found is probably within the limits of error of the method.

3. *Examination of Oil of Lavender.*

The determination of the amount of ester was early suggested as a means of valuation for this oil, though it is evident that linalyl acetate cannot be considered as the only valuable constituent. The method of quantitative saponification, however, gives us, really, only the amount of combined acid, which is assumed to be acetic acid in combination with linalool. Other esters, if present, would give quite erroneous results, and this fact has stimulated the ingenuity of some chemists to provide a variety of synthetic esters, for the express purpose of supplying a fictitious high ester-value to inferior oils. Of these products, the most frequently observed appear to have been glyceryl acetate, or acetin, and terpinyl acetate. The former is especially objectionable by reason of its high saponification value; one percent. of tri-acetin, for example, increases the apparent lialyl acetate content by 2.69%.

Esters of citric, succinic, tartaric, phthalic, salicylic acids, and the mixed esters derived from cocoa-nut oil, have also been found in sophisticated oils, and methods for the detection of some of these have been proposed by Schimmel and Co., and others.

As a rule, these esters are less volatile than lavender oil, and remain as residue, when the oil is redistilled with steam. This test is often useful, and is easily performed.

100 cc. oil are boiled with 150 cc. water in a 250 cc. Ladenburg flask, and the distillate is collected in a "cassia" flask, with the neck graduated for 10 cc. Good oils are readily volatile with this amount of water, and the yield is easily ascertained. The ester-content of the distilled oil should not be more than two percent. lower than that of the original oil, linalyl acetate being not appreciably hydrolyzed under these conditions. The residue can be examined for foreign acids.

For the estimation of acetin, this process is unsatisfactory, acetic acid being found in the distillate, although the greater part remains in the aqueous residue.

We have found that acetin can be determined very conveniently, and with accuracy sufficient for technical purposes, by direct titration in aqueous solution, as follows:

3 grams oil are shaken with 75 cc. water, in a 100 cc. flask. The free acid is then titrated with aqueous $n/2$ KOH, and phenolphthalein. 0.5 cc. more alkali is added, and the flask is heated at about 80° , with frequent shaking. If the color disappears, another 0.5 cc. is added, and the heating continued, with similar addition of alkali, if necessary, until the solution is permanently alkaline, after one hour's heating. The flask is then cooled, and titrated back with $n/2$ acid. The alkali used for saponification is calculated over to acetin (1 cc. $n/2$ KOH = 0.0363 tri-acetin).

Most oils will show a slight amount of water-soluble ester, up to about 0.3%; calculated as acetin, which may be considered as the allowable limit for this method.

No process appears to be available for the determination of terpinyl acetate. Schimmel and Co.'s test (Berichte, Oct., 1911) based on the relatively slow saponification of this ester, seems, however, to be a fairly reliable indication of its presence. In our experience, good oils should not show a difference greater than

0.75% between the ester-values obtained by half hour, and one and one half-hour saponifications.

Fractional distillation with steam, is often of value, the solubility and rotation of the sections being noted. The first 20% fraction should be soluble in three volumes of 70% alcohol; if not, an excess of terpenes is indicated. The rotation will generally increase steadily throughout.

The Specific Gravity of good lavender oil ranges from 0.882 to .892 at 25°, and the rotation from -4° to -7°.

A few examples, from a large number examined, may be of interest.

Sample A. S. G. .8913 @ 25° O. R. -3.20°.
 Ester, (½ hour sapon.) 22.90%.
 " (1 hour sapon.) 23.10%.
 " (1½ hour sapon.) 23.40%.

Distillation test.

10 cc. yielded 9.8 cc., containing 22.1% ester.

Acetin titration, 0.4%.

Fractional distillation:

Section 1. 20%. O. R. —.88°.
 2. 20%. O. R. —2.35.
 3. 20%. O. R. —2.95.
 4. 20%. O. R. —2.95.
 5. 15%. O. R. —4.70.

The first section contained about 30% cineol, indicating the presence of oil of spike.

Sample B. S. G. .9893 @ 25° O. R. -5.55°.
 Ester, (½ hour sapon.) 28.3%.
 Ester, (1½ hour sapon.) 29.9%.
 Acetin titration, 0.6%.

Fractions:

1. 20% O. R. —4.80° (insoluble in 70% alcohol).
 2. 20% O. R. —5.35.
 3. 20% O. R. —6.20.
 4. 20% O. R. —6.60.
 5. 17% O. R. —6.07.

The saponifications indicate the presence of terpinyl acetate: the insolubility of the first section points to excess of terpenes, probably from some other source.

Sample C. S. G. 0.9094 @ 25° O. R. -3.30°.
 Ester, (½ hour sapon). 29.4%.
 Ester, (1½ hour sapon). 30.2%.
 Acetin titration, 0.9%.

Distillation test:

10 cc. yielded 9.4 cc., containing 21.2% ester.

Fractions:

1. 20% O. R. —5.15° (insoluble).
 2. 20% O. R. —2.43.
 3. 20% O. R. —1.91.
 4. 20% O. R. —2.64.
 5. 15% O. R. —4.75.

The drop in ester, in the distilled oil, and the variation in rotation are significant.

Sample D. S. G. 0.9069 @ 25°, O. R. -3.96°.
 Ester, (½ hour sapon.) 23.6%.
 Ester, (1½ hour sapon.) 28.4%.
 Acetin titration, 0.4%.

Distillation test:

10 cc. yielded 9.8 cc., containing 26.8% ester.

The high Specific Gravity, and the variation in saponification, are decided indications of the presence of terpinyl acetate.

Laboratory of the Dodge and Olcott Co.

THE DETECTION OF CHICORY IN DECOCTIONS OF CHICORY AND COFFEE.

CHARLES H. LAWALL AND LEROY FORMAN.

In December, 1913, the American Journal of Pharmacy contained an article by the above authors, in which it was proposed to differentiate between pure coffee decoctions and those which contain chicory or any other substance high in reducing-sugars, by taking into account the ratio of reducing-sugar to extractive. In confirmation of the success of the method we would say that in about twenty-five suits which were instituted for violation of the food laws, in which this method of analysis was applied to the samples, no instance is on record of a denial of the adulteration, and fines were immediately paid by nearly all of the offenders, among whom were included several high-class restaurants and hotels. The object of this paper is to confirm the conclusions given in the former article, and to submit some data upon the analyses of additional products and to offer some suggestions so as to ensure accuracy of judgment for those who desire to make it the basis of legal procedure.

In the first place, it must be understood that the strength of the coffee or the method of its preparation has little or no influence upon the results. This was not made as clear in the former article, as it might have been, so we will now state that, using the same coffee and employing such widely divergent methods of preparation as decoction, filtration and percolation, the ratio of reducing-sugars to extractive, did not exceed the maximum of 3% reducing-sugars calculated to extractive, as the following results will show:

	Percentage of Reducing-Sugars in Extractive
Coffee prepared by filtration (simply pouring boiling water through the powdered material contained in a straining cloth)	2.22
Coffee prepared by decoction (powdered coffee boiled with water and filtered washing the residue on filter with boiling water)	2.39
Coffee prepared by percolation (ground coffee extracted in one of the common household percolator coffee urns)	2.68

In the second place, it must be remembered that coffee-decoctions, in common with other aqueous solutions containing organic matter, undergo decomposition quite readily, and as such decomposition is always accompanied by a loss of reducing-sugars, it is imperative that the analysis of the samples be made promptly after the sample is taken, or that some non-reducing preservative substance, like thymol, be added when the samples are taken or received, in order that the composition may remain constant until the analysis is made.

It must also be remembered that the addition of either sugar, or milk, or cream, vitiates the results, in so far as an accurate conclusion may be drawn. Cane-sugar, as commonly added for sweetening, has no influence upon the presence of

reducing-sugars, but, needlessly, complicates the analysis, by rendering it imperative that the sucrose be separately estimated and subtracted from the extractive found, in order to arrive at a knowledge of the amount of extractive due to the coffee, upon which the ratio is based. The presence of milk or cream entirely vitiates the results, as milk-sugar is a reducing-sugar and as the presence of a small amount of milk or cream might escape detection, it is suggested that the centrifuging of about 10 cc. in a centrifuge such as is used for urinary sediments, or of a larger amount in a Babcock milk-testing machine, will quickly result in the identification and rejection of such samples that have had milk or cream added to them either accidentally or intentionally.

It has been found by us in laboratory practice applied to commercial samples, that about one-fourth of the adulterated samples contain a cereal in addition to the chicory. The detection of the cereal is easily made, easy by testing for starch (which is entirely absent in the beverage made from pure coffee) by taking 10 cc. of the liquid, acidulating with sulphuric acid and adding potassium permanganate solution, drop by drop, until the liquid is just decolorized, when a drop of iodine test-solution added to the filtrate gives the clear-blue starch reaction, which is ordinarily obscured by the dark color of the liquid.

The percentage of reducing-sugars in the extractive of a number of commercial products, is herewith given, as being of an informative character:

Name of Product	Percentage of Reducing-Sugars in Extractive
G. Washington Coffee (a coffee extract)	less than 1%
German Stick Chicory (extract)	22.10
Caramel Cereal	13.69
Postum Cereal	5.43
Instant Postum	6.36
Grist Mill	6.64

The four last named are proprietary substitutes for coffee. All of them contained cereal, as shown by the starch-test above described.

COMPARISON OF THE PHYSICAL PROPERTIES OF SOME OFFICIAL VOLATILE OILS WITH SPECIAL REFERENCE TO THE REQUIREMENTS OF THE U. S. P., 1910.

FRANK RABAK.

Chemical Biologist, Drug-Plant and Poisonous-Plant Investigations. Bureau of
Plant Industry.

The ninth decennial revision of the United States Pharmacopœia has resulted in numerous changes in the section devoted to volatile oils, especially with regard to the physical properties of the various oils. Among the properties described are color, odor, taste, specific gravity, optical rotation, and solubility, the refractive index being mentioned in only few instances. The importance of these properties should not be underestimated, as the varying quality of any volatile oil may be readily observed by means of them. Because of the inability of the

senses, to measure accurately the color, odor, and taste of a volatile oil, these properties are necessarily somewhat less significant than those which admit of careful and accurate measurement. The color of a volatile oil, is a property which may, however, be influenced greatly, by a number of factors such as the condition of the plant, whether fresh, dry, or partly dry, the stage of growth, and the length of time of distillation. The last factor is especially important since, in numerous distillations of aromatic plants it has been observed that the first runnings are invariably lighter in color than the later portions of the oil. This is, probably, partly due to the fact that fractionation takes place during the distilling process, the lighter, most volatile and usually least colored portions of the oil, distilling over before the denser and higher-boiling constituents make their appearance. In order therefore to obtain a genuine sample of an oil it is of utmost importance that the distillation process be continued until extraction of the oil is complete. The odor and taste will be likewise affected, but the latter is less capable of being described than the former. Only pronounced differences, at best, can be observed by the sense of taste and smell, yet these properties are beneficial, and even *necessary*, in the preliminary examination of a volatile oil.

In direct contrast to the above properties, which are uncertain of expression, are specific gravity and optical rotation, both of which are readily determined and expressed in figures to admit of easy comparison. Specific gravity is, perhaps, the most important of the physical properties of volatile oils and is influenced very much by the source and condition of a plant, as well as by seasonal changes, the effects of these factors being reflected in the density of the oil. Optical rotation and likewise solubility, while possibly less important, are nevertheless dependent to a large extent upon the chemical composition of the oil, which, in turn, is modified by condition of distillation, ripeness of the plant and climatic conditions. Each physical property may be said to serve a more or less definite purpose in general examinations of volatile oils, before the application of special chemical methods for the determination of any definitely-known constituents.

While a large number of aromatic plants have been under observation by the writer, only those which are officially recognized by the U. S. Pharmacopœia, will be considered here. The paper has been prepared with a two-fold object. First, a comparison of the physical properties of the oils with the requirements of the U. S. Pharmacopœia, 1910, will be made, and, secondly, the properties of each oil will be compared through several successive seasons, in order to show the effect of seasonal influence on the general characteristics of the oils.

The oils which will be discussed with respect to their physical properties, and compared with the limitations adopted by the U. S. Pharmacopœia, 1910, are as follows:—Chenopodium, Fennel, Lavender, Pennyroyal, Peppermint, Rosemary, Spearmint, and Thyme.

At the outset, it is essential to state that the above plants were grown in the same locality for several years. Each plant was distilled with steam, while in full bloom, the material being cut and distilled immediately, in order to prevent any changes which might be brought about by drying or partial-drying, and in order that the oils might be directly comparable from season to season. Distillation was continued in each case, until little or no oil was perceptible, when a

small quantity of distillate was collected in a test tube, true samples of the oils being thereby obtained from the respective plants. The oils were subsequently filtered and kept in tightly-stoppered bottles, in a dark place, until the determinations were made.

The various physical properties as mentioned previously, were carefully determined for each oil, and the results tabulated.

Table I embodies the color, odor, and taste of the various oils distilled during the seasons 1907, 1908, 1909, and 1910. For the purpose of comparison, the requirements of the U. S. Pharmacopœia, 1910, are included in this table as well as the tables following.

TABLE I—COLOR, ODOR AND TASTE.

Oil	Requirements of U. S. P. 1910, 9th Revision	Oils distilled during several successive seasons at Arlington Experimental Farm			
		1907	1908	1909	1910
Chenopodium	Colorless, or pale yellow; characteristic disagreeable odor and taste.	Light brown color; penetrating offensive odor; sharp and bitter taste.	Golden yellow color; characteristic offensive odor; very pungent and bitter taste.
Fennel	Colorless, or pale yellow; characteristic odor and taste.	*Very pale yellow color; sweet pleasant and aromatic odor and taste.	*Pale yellow color; sweet fragrant odor; fatty, sweet taste.
Lavender ...	Colorless, or yellow; characteristic odor and taste.	Pale yellow color; pleasant fragrant characteristic odor; aromatic, slightly bitter taste.	Golden yellow color; agreeable flowery characteristic odor; aromatic bitter taste.	Pale brown color; agreeable, flowery odor; aromatic, bitter taste.
Pennyroyal ..	Pale yellow color; characteristic odor and taste.	Bright yellow color; minty characteristic odor; minty, slightly bitter taste.	Very pale yellow; pleasant, minty odor, pungent, minty taste.	Yellowish color; odor agreeable, not noticeably minty; bitter pungent, minty taste.
Peppermint ..	Colorless; strong odor of pepper-mint; pungent cooling taste.	Greenish-yellow color; agreeable minty odor; pungent cooling taste.	Light yellowish green; pleasant minty odor; very pungent; cooling taste.	Pale yellow; agreeable, minty odor; pungent minty taste.	Pale yellow; mild, agreeable, minty odor; fatty pungent, cooling taste.
Rosemary ...	Colorless, or pale yellow; characteristic odor; camphoraceous taste.	Yellow color; pleasant, aromatic odor; slightly bitter, camphoraceous taste.
Spearmint ...	Colorless, yellow or greenish yellow; characteristic odor and taste.	Light yellowish color; sharp, aromatic, characteristic taste.	Light green color; agreeable, characteristic odor; characteristic, minty, pungent taste.	Pale green; agreeable, flowery odor; bitter, pungent, aromatic taste.	Dark golden yellow; strong aromatic, characteristic odor; very pungent, bitter, characteristic taste.
Thyme	Colorless, or red; characteristic odor and taste.	Light brown color; strong thymol-like odor; extremely pungent taste.	Golden yellow, mild, not unpleasant aromatic odor; very pungent taste.	Light brown color; flowery strong, thyme-like odor; very pungent taste.	Brownish red color; thymol-like, not unpleasant odor; intensely pungent taste.

* Oils from fruiting tops.

From Table I it will be seen that the *Chenopodium* oils distilled in 1907 and 1908, were darker in color than the requirements of the Pharmacopœia. Fennel oils distilled in 1909 and 1910, corresponded more closely to the color requirements. Lavender oils, on the other hand, from three successive season's crops,

showed some variation in color, from pale-yellow to a pale-brown, probably because of differences in the plant material due to seasonal conditions. Pennyroyal and rosemary oils corresponded fairly closely in color to the Pharmacopœial requirements, while peppermint and spearmint varied greatly from year to year. Thyme oils from seasons of 1907, 1908, 1909, and 1910 ranged from a golden-yellow to brownish-red color, a colorless oil never having been distilled during the number of seasons in which this plant has been under observation. The odor and taste of the various oils, are described in most cases as "characteristic," hence a comparison of these properties could not be made, other than among the individual oils from season to season. The properties of odor and taste, will be seen to differ considerably in some cases, doubtless due to a variation in composition of the respective oils.

It would seem, from the data presented, that the color of an oil, is a property which is subject to wide variation, the odor and taste also showing differences sufficient to be more or less easily detected by the senses. While descriptions of these properties depend largely upon individual sensitiveness, a careful analytical description of odor and taste would be decidedly advantageous.

TABLE II—SPECIFIC GRAVITY.

Oils	Requirements of U. S. P., 1910, 9th Revision 25° C.	Oil distilled during several successive seasons at Arlington Experimental Farm			
		1907	1908	1909	1910
Chenopodium	0.955 to 0.980	0.933 (25° C.)	0.944 (24° C.)
Fennel	0.953 to 0.973	0.927 (23° C.)*	0.944 (24° C.)
Lavender	0.875 to 0.888	0.890 (24° C.)	0.892 (20° C.)	0.8962 (23° C.)
Pennyroyal ..	0.920 to 0.935	0.9195 (24° C.)	0.9209 (22° C.)	0.9365 (23° C.)
Peppermint ..	0.894 to 0.914	0.9048 (25° C.)	0.924 (23° C.)	0.9203 (22° C.)	0.9273 (23° C.)
Rosemary	0.894 to 0.912	0.8947 (21° C.)
Spearmint	0.914 to 0.934	0.923 (25° C.)	0.918 (22° C.)	0.9289 (21° C.)	0.9252 (24° C.)
Thyme	0.894 to 0.929	0.898 (25° C.)	0.897 (24° C.)	0.9144 (21° C.)	0.936 (24° C.)

* Oils from fruiting tops.

It will be observed, from Table II, that the specific gravities of the Chenopodium oils, easily fall within the requirements prescribed by the Pharmacopœia. The densities of the fennel oils, are below the standard, which is, doubtless, due to the fact that these oils were distilled in 1909 and 1910, from the partly ripe fruiting-tops and from ripe fruiting-tops respectively, while the Pharmacopœia specifies the oil from ripe fruit. Lavender oils from the seasons of 1908, 1909, and 1910 are uniformly regular and higher in specific gravity than the requirements. These oils were distilled from fully matured fresh flowering-tops of lavender. Since this oil is produced in foreign countries exclusively, it is probable that the higher densities of the American oils are due to climatic and soil conditions contingent upon geographical sources. No important differences were revealed in the specific gravities of the pennyroyal oils included in the table, the slightly higher specific gravity of the 1910 oil, being due to the slightly lower temperature at which it was observed. The peppermint oils from the four successive seasons are perhaps somewhat higher than the upper limit specified by the Pharmacopœia. This is especially true of the oils distilled during the seasons of 1908, 1909, and 1910. The slightly lower temperature at which the densities were taken, would probably not account for the higher figures obtained. Rosemary

and spearmint oils shows no noteworthy discrepancies, while only the thyme oil of 1910 is beyond the upper limit of the Pharmacopœial requirement.

It is most evident that the specific gravity, is a property which is materially influenced by the numerous factors and conditions attending the distillation process, and the nature and condition of the plant material as influenced by seasonal variations.

TABLE III—OPTICAL ROTATION.

Oils	Requirements of U. S. P., 1910, 9th Revision 100 mm. tubes	Oil distilled during several successive seasons at Arlington Experimental Farm			
		1907	1908	1909	1910
Chenopodium	—4° to —10°	—7.7° Specific rotation	—6.6° Specific rotation
Fennel	+12° to 24°	+14.9° (50 mm. tube)*	+13.8° (50 mm. tube)*
Lavender	—1° to —10°	—4° (50 mm. tube)	—6.5° (50 mm. tube)	—1.4° (50 mm. tube)
Pennyroyal ..	+17° to 28°	+34.4° (50 mm. tube)	+28.6° (50 mm. tube)	+13.3° (50 mm. tube)
Peppermint ..	—20° to 35°	—10.4° (50 mm. tube)	—4.5° (50 mm. tube)	—10.6° (50 mm. tube)	—5.7° (50 mm. tube)
Rosemary	—2.4° (50 mm. tube)
Spearmint ...	—35° to 50°	—45.6° (Specific rotation)	—27.3° (50 mm. tube)	—16.1° (50 mm. tube)	—20.3° (50 mm. tube)
Thyme	Slightly lavogyrate	—1.3° (50 mm. tube)	—0.6° (50 mm. tube)	—1.1° (50 mm. tube)

* Oils from fruiting tops.

The optical rotation of the Chenopodium oils, as shown, fall well within the limits prescribed by the Pharmacopœia. The fennel oils, as in the case of the specific gravities, are higher in rotatory power than the limits of the Pharmacopœia this being due in all probability to the state of ripeness of the material when distilled, as previously discussed. The rotation of the lavender oils, shows much variation from year to year, the oil from the 1909 crop being considerably higher than the limit of optical rotation of the Pharmacopœia. The pennyroyal oils likewise, differ in rotation from season to season, the oils of the 1908 and 1909 crop being conspicuously higher than the standards, especially if reduced to terms of rotation in a 100 mm. tube, only the oil of the 1910 crop falling within the limits of rotation. Marked differences in rotation, are also noted in peppermint and spearmint oils during four successive seasons, varying from —4.5° to —10.6° in the former and —16.1° to —27.3° in the latter, all observations being taken in a 50 mm. tube. Peppermint oils, from the 1908 and 1910 crops, are below the minimum optical rotation adopted by the Pharmacopœia. The oil of the 1908 crops of spearmint, shows an optical rotation above that of the maximum of the Pharmacopœia. The thyme oils were slightly lavogyrate, varying from —0.6° to —1.3° in a 50 mm. tube.

In the matter of the optical rotation it is again obvious that variability in this property is more or less marked, showing that the composition of the oils change somewhat from season to season depending upon the numerous factors previously mentioned.

TABLE IV—SOLUBILITY.

Oils	Requirements of U. S. P., 1910, 9th Revision	Oils distilled during several successive seasons at Arlington Experimental Farm			
		1907	1908	1909	1910
Chenopodium	8 vols. 70% alcohol	1 vol. 80% alcohol clear solution	0.75 vol. 80% al- cohol clear solu- tion.
Fennel	8 vols. 80% alcohol 1 vol. 90% alcohol	* Turbid in 12 vols. 80% alcohol. 2 vols. 90% alco- hol with clear so- lution.	* 2.5 vols. 80% alcohol. Clear in excess.
Lavender	3 vols. 70% alcohol	0.75 vol. 80% al- cohol clear solu- tion.	1.2 vols. 80% al- cohol.	0.8 vol. 80% al- cohol. Turbid in 4 vols. or more.
Pennyroyal ..	2 vols. 70% alcohol	1 vol. 80% alco- hol slightly tur- bid on further di- lution.	0.5 vol. 80% al- cohol. Clear so- lution.	All proportions in 80% alcohol.
Peppermint ..	4 vols. 70% alcohol with only slight opales- cence.	1.5 vols. 80% clear solution	1.25 vols. 80% al- cohol clear solu- tion.	1.2 vols. 80% al- cohol; turbid with 2 vols. or more.	0.6 vol. 80% al- cohol; turbid with 2 vols. or more.
Rosemary	10 vols. 80% al- cohol.	Insoluble in 80% alcohol with clear solution. 0.75 vol. 90% alcohol.
Spearmint ...	1 vol. 80% alco- hol; cloudy on further dilution.	1 vol. 80% alco- hol clear solution.	Turbid in all pro- portions with 80% alcohol. 1 vol. 90% alcohol cloudy on further dilution.	1 vol. 80% alco- hol; turbid with 2 vols. or more.	0.4 vol. 80% al- cohol; turbid with 2 vols. or more.

* Oils from fruiting tops.

It is unfortunate that the solubilities of all the oils in question, were determined with 80% and 90% alcohol, the Pharmacopœial requirements specifying 70% alcohol in several cases. However, the results will at least admit of comparisons being made of the solubility of the oils from one season to another.

The solubility of the Chenopodium oils from crops of 1907 and 1908, vary but slightly.

The fennel oils are widely separated with respect to solubility in 80% alcohol, the oil of the 1909 crop being turbid in 12 volumes of 80% alcohol, while the oil of the 1910 crop dissolved in 2½ volumes of 80% alcohol with a clear solution. The latter oil being distilled from ripe fruiting-tops, probably accounts for its much greater solubility. No doubt distinct differences exist between the composition of these two oils,—the oil from the partly unripe fruiting-tops consisting undoubtedly of a larger proportion of terpenic compounds.

Distinct differences in the solubility of the lavender oils, are also disclosed, as may be seen from the table. Comparison with the requirements of the Pharmacopœia, are incapable of being made, in case of lavender and pennyroyal oils, because of the employment of alcohol of different percentage strength. In a like

manner, pennyroyal oils from 1908, 1909, and 1910 crops, show considerable diversity with regard to their solubility in 80% alcohol. Peppermint oils from the four seasons crops exhibited very constant solubilities in 80% alcohol, the 1910 oil being most soluble. Rosemary oil distilled from 1909 crop, was found to be insoluble in 80% alcohol to make a clear solution; the Pharmacopœial requirement of the oil being 10 volumes of 80% alcohol. Spearmint oils exhibited decidedly variable solubility in 80% alcohol. The oil from the 1908 crop, was insoluble to a clear solution in 80% alcohol while the 1910 oil, in direct contrast, was soluble in 0.4 volume, becoming turbid in excess of two volumes of 80% alcohol.

The thyme oils distilled during the four successive seasons, were soluble in one to two volumes of 80% alcohol, all being within the requirements of the Pharmacopœia in this respect.

The results of the comparison of physical properties of the several official volatile oils, are such as to clearly indicate that conditions of cultivation, harvest, and distillation affect the physical constants of the oils. It is noteworthy of mention, in connection with the data presented, that all of the plants from which the above oils were obtained, were grown and distilled in the same locality, under identical conditions of harvest and distillation, yet variations are evident in the properties of the volatile oils. That seasonal conditions affect the composition of the oils, can hardly be doubted, from the comparisons of the several physical properties in the foregoing pages. The variations in specific gravity, optical rotation and solubility, are especially significant, since these properties bear direct relationship to the chemical composition of the oils. In some instances only were the constants of the oils within the limits of the Pharmacopœial requirements, yet the oils under observation were distilled with utmost care from material carefully grown and harvested, and therefore, must be considered as true, authentic samples.

DISCUSSION.

MR. ASHER: I would like to ask Dr. Stockberger whether other analyses have been made of these oils at various times, that is for instance, the oils made in 1907; whether analyses were made in 1910, and so on. My object in asking that question is this. I have done a great deal of work with the pinenes. We have examined, in the experiments we have conducted, these oils for solubility, refractive index and after several years found these possessed different constants from those found when previously tested and no doubt the oils taken as standards by the pharmacopœia were not taken from fresh samples, as in this case and very much of the difference of the constants is no doubt due to some changes due to time.

DR. STOCKBERGER: Yes, samples of these oils have been examined from time to time and in many cases they have been found to vary with time in respect to their constants. On the other hand the figures shown in these tables were obtained from freshly distilled oils, and are presented to show the variations in these oils according to the season in which they were produced.

MR. ASHER: Just one further question in that regard, Mr. Stockberger. Did the gentleman who did the work later test these samples and did they then correspond with the samples in the pharmacopœia?

DR. STOCKBERGER: I am unable to answer that absolutely, because it is a special point with reference to the author's work which I am not sufficiently well acquainted with, to enable me to make a categorical answer. The intent of the author of this paper is to show that absolutely authentic material was worked with and that it is quite possible to have an authentic oil which does not conform to pharmacopœial requirements.

MR. CHARLES T. P. FENNEL, of Cincinnati: Were the oils ever tested for moisture?

DR. STOCKBERGER: Yes, sir. The oils were dry.

MR. FENNEL: You are sure of that? I made a series of experiments a good many years ago, and I claim that quite a number of these oils contained water. I recall very distinctly the oil of cloves contained two percent. water. My claim for content of water was denied

by manufacturers of volatile oil, especially one, but years afterwards the sample in question was picked out of the list presented and the distiller admitted it contained two percent. of water. The records of the Association gave the data but I am not able to recall the time it was published.

MR. STOCKBERGER: I know it has been Mr. Rabak's custom in working with these oils to take all precautions, so far as possible, to remove moisture from the oil. Whether it was absolutely removed or not, of course, it is impossible for me to say, but I know that is my impression, that they were moisture free samples.

NOTES ON A NEW ALKALOID FOUND IN NUX VOMICA.*

HUGO H. SCHAEFER.

We find from time to time in pharmaceutical literature, reports of the discovery of new alkaloids in nux vomica beans, that is, alkaloids other than strychnine or brucine. In the Jour. Chem. Soc. (39-457), Shenstone reports the finding of an alkaloid freely soluble in warm water. After describing the substance, the author states that it is probably brucine with some persistent impurity. In the Pharm. Jour. (III, XIV, 1025) Dunston reports the discovery of a glucoside in nux vomica, which he terms loganin. Desnoir (Jahresbericht 50-54, p. 48) describes a new nux vomica alkaloid, which he calls igasurine. This, he claims, is an intensely bitter substance, giving tests entirely different from those of strychnine or brucine. Again, in Gmelin (XVII—589), we find that igasurine is a very bitter substance resembling brucine, but more soluble in water. Schutzenberg (Am. Jour. Pharm., 1858-535) reports that igasurine is really composed of nine different and distinct alkaloids. He separates these by fractional crystallizations and gives a brief description of each one. Finally we find, in Am. Jour. Pharm. (1872-256, Jörgenston), evidence that there is no such alkaloid as igasurine, or at least, that the substance so-called, can be readily converted into brucine, by treating with potassium iodide, filtering off and regenerating the alkaloid, which will be found to be brucine.

We therefore see, from the above contradicting statements, that it is an open question as to whether such an alkaloid as igasurine really exists. However, the author now wishes to report the finding of an alkaloid in nux vomica, which is totally different from strychnine, brucine, or any of the igasurines, as described in literature, and which alkaloid he proposes to call *struxine*.

This alkaloid makes its appearance during the process of manufacturing strychnine. In neutralizing the acid-solution of the raw alkaloidal sulphates of nux vomica, the new alkaloid separates out as a base, when the liquors become just neutral, or are still slightly acid, while strychnine and brucine remain in solution as sulphates. It was found that only few lots of nux vomica beans contained this substance, and the quantities, in those which did contain it, differed greatly with different lots. Careful record was made of the beans which yielded this new alkaloid, and this proved that all such beans were from shipments made from Cochin-China. Those lots which consisted mostly of small beans, insect-eaten

* Read before Scientific Section at Detroit.

and partly decomposed by prolonged exposure in wet fields, contained the largest percentage of the alkaloid. The average amount found in these beans was 0.1%.

Struxine, which separates from the solution of raw alkaloids as above stated, was filtered off, dissolved in an excess of dilute sulphuric acid, made alkaline, and the precipitated alkaloid again filtered off. This was now purified by repeated recrystallizations from alcohol.

The final pure product, when freshly made, consists of colorless crystals containing no water of crystallization. Upon exposure to air and light, however, the crystals gradually develop a faint yellowish color. No melting point could be determined, as the substance begins to char at about 250° C. A solution of it gives typical alkaloidal reaction with gold chloride, platinum chloride, mercuric chloride, Bouchardat's, Marme's, Mayer's, Dragendorff's, Sonnenschein's, and Scheibler's reagents, and with tannic acid and picric acid. The alkaloid is only very slightly bitter, which lack of taste is probably due to its extreme insolubility in water, since the more soluble salts of *struxine* are distinctly bitter, but have not the intensity of either strychnine or brucine, or any of the igasurines, as reported in literature.

The following solubility determinations were made:—

In water 1-5000 cc.	In chloroform 1-1 2/3 cc.
In alcohol 1-190 cc.	In ether 1-450 cc.
In methyl 1-210 cc.	In benzol 1-35 cc.

Upon microscopical examination, it was found that the crystals are all of well-defined rhombic form. This, together with the fact that various attempts at fractional crystallization proved failures, shows that the substance is not a mixture of alkaloids, but is a uniform product.

The ultimate analysis of the alkaloid gave the following composition:—

	A.	B.	Average
C.	67.31%	67.11	67.21
H.	7.89	8.13	8.01
N.	7.62	7.44	7.53
O.	17.18	17.32	17.25

A careful determination by means of the freezing-point method, indicated that the alkaloid had a molecular weight of 371. From this data, it was calculated that the empiric formula of *struxine* is $C_{21}H_{30}N_2O_4$, which would give it a molecular weight of 374.53. As will be noted below, this molecular weight is between that of strychnine, and of brucine, and its formula in certain respects resembles that of strychnine and brucine.

Empiric Formula

<i>Struxine</i>	$C_{21}H_{30}N_2O_4$	374.53
Strychnine	$C_{21}H_{22}N_2O_2$	334.466
Brucine	$C_{23}H_{26}N_2O_4$	394.518

Because of these resemblances, it is thought that, possibly, the new alkaloid is a product of decomposition, by fermentation or oxidation of either strychnine or brucine. The fact that those beans which are insect-eaten and partly decomposed, contain more of the alkaloid than good beans, would also indicate this.

Various salts of *struxine* were made, and it was found that it forms normal and

acid salts. The latter, in most cases, however, only from a solution containing a very large excess of acid. All the salts react acid to litmus, and when these acid solutions were neutralized with ammonia water, the free alkaloid separated out, even while the solution showed still a faint acid reaction. No melting points could be obtained, since all these salts charred at 240°-250° C.

Among the salts made and examined, were the following:—

Sulphate— $(C_{21}H_{30}N_2O_4)_2H_2SO_4 \cdot 8H_2O$.

This is a yellowish, crystalline salt, possessing a bitter taste, soluble in water 1-120, in boiling water 1-12, and in alcohol 1-100.

Bisulphate— $C_{21}H_{30}N_2O_4 \cdot H_2SO_4 \cdot 1H_2O$.

This is a white crystalline salt, possessing a bitter taste, soluble in water 1-75 and in alcohol 1-210.

Hydrochloride— $C_{21}H_{30}N_2O_4 \cdot HCl \cdot 3H_2O$.

This is a yellow crystalline salt, which with water, gives a golden yellow-colored solution, having a bitter taste. It is soluble in water 1-85 and in alcohol 1-75. The alkaloid does not combine with two molecules of hydrochloric acid, since even from a solution of a large excess of acid, the neutral salt is obtained.

Hydrobromide— $C_{21}H_{30}N_2O_4 \cdot HBr \cdot 2H_2O$.

This is a yellowish, bitter crystalline salt, soluble in water 1-115 and in alcohol 1-100. A di-hydrobromide could not be obtained even from a solution containing a large excess of hydrobromic acid.

Bitartrate— $C_{21}H_{30}N_2O_4 \cdot H_2C_4H_4O_6 \cdot 2H_2O$.

This salt consists of white, glistening, flaky crystals possessing a bitter taste. Only the acid salt could be obtained. In attempting to make the normal salt, the theoretical quantities of acid and alkaloid in hot water, formed a product which was found to be a mixture of the alkaloid and acid tartrate. Upon using double the amount of tartaric acid, however, all the alkaloid went into solution, from which upon cooling, the acid tartrate crystallized out in beautiful flaky crystals, sparingly soluble in water or alcohol. These crystals, when dissolved in hot water, form a solution of strong acid character. If this solution is neutralized with ammonia water until neutral to litmus, no normal tartrate is obtained, but free alkaloid crystallizes out.

An attempt was made to obtain the acetate of the alkaloid. It was found, however, that no such salt could be obtained in crystallized form.

Many tests were made with the new alkaloid, in order to find characteristic reactions and possible resemblances to strychnine or brucine.

Among these reactions were the following:—

A. A small quantity of the alkaloid will give no color when a drop of concentrated sulphuric acid is added. If to this mixture, however, a crystal of potassium dichromate be added, a yellow color will be obtained, which slowly changes to green.

B. If to a small quantity of the alkaloid, a drop of concentrated sulphuric acid be added, and then a small particle of sodium nitrite, a dark brown color is obtained.

C. If to a small quantity of the alkaloid, a drop of concentrated sulphuric acid be added, and then a small particle of lead peroxide, a dark brown color is obtained, which slowly changes to purple, and finally to violet.

D. If to a small quantity of the alkaloid, a drop of concentrated sulphuric acid

be added, and then a small crystal of potassium ferricyanide, an orange color is obtained which changes to brown.

E. If to a small quantity of the alkaloid, a drop or two of concentrated sulphuric acid be added, and then a few particles of manganese dioxide, a brown color is obtained which slowly changes to purple.

F. A small quantity of the alkaloid will give a brown color, upon addition of a drop of concentrated nitric acid, which color does not change upon addition of a small quantity of zinc chloride.

G. If a small quantity of the alkaloid be dissolved in a few drops of nitric acid and the mixture evaporated to dryness, a light yellow residue remains behind. If this residue be dissolved in ammonia water, a reddish-colored solution is obtained. If alcoholic potassium hydroxide solution now be added, a red to brown precipitate is obtained.

H. If to a small quantity of the alkaloid, a few drops of aqueous solution of potassium hydroxide be added, and the mixture evaporated to dryness, a brown residue remains behind.

I. If to a small quantity of the alkaloid, a drop of a solution of stannous chloride be added, a yellow color is obtained.

J. If to a small quantity of the alkaloid, a drop of concentrated hydrochloric acid be added, a yellow color is obtained.

K. If to a small quantity of the alkaloid, a drop of alcoholic solution of potassium hydroxide be added, an orange color is obtained, which slowly changes to red and then to brown, and finally to black. This test can also be performed by treating the alkaloid with a drop of aqueous solution of potassium hydroxide, which produces no change in color. However, as soon as a drop of alcohol is now added, to the mixture, the above color-changes occur.

All the foregoing tests were made on watch-glasses, or crucible covers with the dry alkaloid. The following tests were made in test tubes, using a saturated aqueous solution of the sulphate:—

L. A small quantity of the saturated solution when treated with an equal portion of concentrated sulphuric acid gives a pink color. If now a particle of sodium nitrite be added, a red-colored solution is slowly formed.

M. The solution of the sulphate gives a yellow-colored precipitate, upon addition of a solution of picric acid.

N. Upon addition of an equal portion of concentrated hydrochloric acid to the saturated solution, no color is obtained even on heating.

O. Upon addition of chlorine water to the saturated solution of the sulphate, a yellow-colored mixture is obtained with no precipitate.

P. A heavy yellow precipitate is obtained from the solution of the sulphate upon addition of as little as one drop of bromine water.

Q. If a small quantity of the saturated solution be diluted with an equal portion of alcohol, and two or three drops of bromine water now be added, no precipitate appears and the solution remains colorless. However, if a large excess of bromine water be added, a yellow precipitate is formed.

R. If an excess of sulphuric acid be added to the solution of *struxine sulphate*, and sodium carbonate or bicarbonate be added in excess, a heavy white precipitate is formed, showing that the alkaloid is not soluble in a solution of carbon dioxide.

S. A solution of potassium chlorate, when added to the solution of sulphate, will cause no color-change or precipitation.

T. If to the saturated solution, a solution of potassium ferri-cyanide be added, a dense white precipitate is obtained.

U. If to the solution of the sulphate a solution of potassium ferro-cyanide be

added, an amorphous yellow precipitate is obtained. If an equal portion of alcohol now be added, the precipitate immediately dissolves.

V. Tincture of iodine, when added to the solution of the sulphate, gives a brown precipitate.

W. If to the solution of the sulphate, some alcoholic potassium hydroxide solution be added, the mixture slowly takes on a pink color, gradually changing into cherry, then red, and, finally, purple.

This test is characteristic of this alkaloid only, and therefore many modifications were tried, until the following was finally determined as being the sharpest and most definite:—

Y. If to the saturated alcoholic solution of the sulphate (1-100) an equal part of alcoholic solution of potassium hydroxide 10% be added, within one minute, the mixture will take on a cherry-red color, which turns darker upon standing. If to this colored mixture, four drops of alcoholic solution of resorcinol (1-100) be added, the color immediately changes to intense dark green. If alcoholic solutions of either hydrochinone, or anthra-quinone (1-100) be used in place of the resorcinol, the same green color will be obtained.

These experiments, reactions and descriptions prove conclusively that there is a third alkaloid in *nux vomica*, unlike any described in literature under the name *igasurine*. While studying the alkaloid, much more research work suggested itself to the author, and the results of some of it will be published in a later paper. Experiments will also be made to obtain the physiological reaction of *struxine*.

Laboratory N. Y. Quinine and Chem. Works.

LABORATORY NOTES.

GEORGE E. E'WE AND CHARLES E. VANDERKLEED.

In every laboratory where a large variety of work is being done, many observations are made from time to time, which are not of enough importance in themselves to be dignified by making them the subjects for scientific papers; yet they may be of interest and importance to workers in other laboratories. Under the title of "Laboratory Notes," therefore, we have collected a number of such observations of miscellaneous character, hoping that they may prove to be of interest to members of the Scientific Section, and that they may prove to be a step in the direction of encouraging, at our meetings, the mutual exchange of laboratory ideas.

Criticism of U. S. P. Directions for Making Decinormal Iodine Solution:—
The U. S. Pharmacopœia directs, in making N/10 Iodine solution, to

"Dissolve 12.59 gm. pure iodine in a solution of 18 gm. of potassium iodide in 300 cc. water."

This procedure of making the solution, requires from one to three hours. A great saving in time may be effected by cutting down the amount of water to about 40 cc. By this modified method, the solution may be prepared in about 10

minutes, and will be found to be quite as accurate as a solution made by the longer process, as is shown by the following experiments:—

Method	Time Required	Factor of the N/10 Solution
U. S. P. procedure.....	3 hours	1.000
Short method, diluted after 10 minutes....	15 minutes	1.001
Short method, allowing to stand 1 hour after iodine is dissolved.....	1¼ hours	1.001

Note on U. S. P. Method of Assaying Solution of Lead Subacetate:—In this assay, the U. S. Pharmacopœia directs that an aliquot part of the solution be taken for titration of excess of oxalic acid, after allowing the precipitate to settle. To insure freedom from the lead precipitate and to effect a saving of time, filtration of the mixture is advisable. The mixture may be filtered without waiting for the precipitate to settle.

Note on the U. S. P. Assay of Nux Vomica for Strychnine:—In the assay for strychnine, the U. S. Pharmacopœia directs the filtration of the final chloroformic extractions containing strychnine, in order to prevent the carrying over of some of the fixed alkali used to liberate the alkaloid. This filtration of the chloroform is not always productive of perfect results, since the filtered solutions sometimes still contain traces of fixed alkali. In four experiments, the extra precaution of washing the united chloroformic extractions with 10 cc. water resulted in reductions of 1.9%, 1.1%, 1.8%, and 2.3% of the total strychnine apparently present.

Assay of Tincture Ferric Citro-Chloride N. F.:—The National Formulary provides no methods of assay or control for N. F. preparations, each laboratory being obliged to provide its own methods for their control. We have found the U. S. P. method for the assay of Tincture of Ferric Chloride is applicable to this tincture with fairly accurate results. The presence of the citric acid does not materially interfere with the oxidation of the iron to the ferric state nor the subsequent reduction to ferrous iron by the hydriodic acid. Experiments on samples which contained known amounts of iron returned on the average, 98.5% of the iron present, by this method.

One sample of Tincture Ferric Citro-Chloride came under our observation, which contained a large precipitate consisting of a complex double salt of iron and sodium citrate. The precipitate contained about 50% of the iron present.

Determination of Chromium in Presence of Acacia:—Organic substances generally interfere with the precipitation by ammonia, of members of the iron group, to which chromium belongs. Chromium sulphate occurs in the market in the form of scales, which, with the assistance of a binder such as acacia, may be readily compressed into tablets. In attempting to assay chromium sulphate tablets containing 10% of acacia, it was found that the chromium could be precipitated quantitatively as hydroxide by ammonia, without interference from the acacia. On the other hand, acacia prevents the precipitation of iron. The possibility of a new method for the separation of iron and chromium, is also suggested by this observation.

Detection of Nitric Acid in Lime Juice:—Although nitric acid is a very infrequent adulterant in lime juice, its detection, when present, presents difficulty, since most of the tests for nitric acid are color-reactions, in which concentrated sul-

phuric acid is used, and the latter carbonizes the organic matter present, thus obscuring the color-reaction. The following method, which has no such objection, will readily detect 0.1% of nitric acid in lime juice.

Place 5 cc. of lime juice, 5 cc. of 20% of potassium hydroxide solution, and about 0.5 gm. of granulated aluminum in a test-tube loosely stoppered with cotton. Heat on steam-bath for 10 minutes. No odor of ammonia should be noticeable during that time, indicating absence of nitric acid.

Interference of Aniline Colors in Alkaloidal Assays:—We have occasionally found on the market alkaloidal preparations, such as Powdered Extract Stramonium, containing a green aniline dye to simulate the natural color of the leaf. In attempting to assay such extracts we have found that the green color appears in the alkaloidal residue which is to be titrated. Besides obscuring the end-reaction, some of these colors are basic in character and increase the apparent amount of alkaloid present. In one specimen which we examined, the color present increased the apparent amount of alkaloid present to the extent of 24%. The interfering color can usually be eliminated by extracting the acid solution of the alkaloids, with chloroform or other suitable solvent, before making alkaline for the extraction of the alkaloids.

Occurrence of Guaiac Resin in Scammony Resin:—Alcoholic solutions of scammony resin, occasionally give a blue coloration with ferric chloride, indicating the presence of guaiac resin. This test, which is given in the U. S. Pharmacopœia under Scammony, should be repeated under Resin of Scammony.

Physical Instability of Mercurial Ointment:—Because of the high specific gravity of metallic mercury, mercurial ointments are subject to a settling of the mercury to the bottom of the container. In one instance, a 50% ointment was examined which assayed 75% mercury when sampled from the bottom. It would be well to include in the U. S. Pharmacopœia, directions to "mix well before dispensing."

Influence of Method of Manufacture on Composition of Compound Solution of Cresol, U. S. P.:—When prepared by the cold process, exactly as prescribed by the U. S. Pharmacopœia, a lot of Liquor Cresolis Comp. assayed 8.5% water and 48.5% phenols by the methods of assay given in Bulletin 107, Bureau of Animal Industry, U. S. Department of Agriculture. When prepared by the more satisfactory method of heating to saponify the linseed oil and dissolving the resultant soap while hot in the cresol, many lots manufactured ranged from 5 to 8.6% of water and from 48 to 50% of phenols.

Volatility of Caffeine and of Acetanilid in a Current of Steam:—Having occasion to separate monobromated camphor from a tablet-mixture containing among other ingredients caffeine, the mixture was distilled with steam. Caffeine was found along with the monobromated camphor in the distillate. To determine to what extent the caffeine was volatilized under the conditions employed in the separation of the monobromated camphor from the tablet-mixture, 1 gm. of caffeine was distilled with steam until a 500 cc. distillate was obtained. 0.8% of the caffeine was recovered from the distillate.

Acetanilid is also slightly volatile in a current of steam, and as was expected, the volatility is somewhat greater than that of caffeine. An experiment resulted

in 3% of the acetanilid being found in the distillate, when 2 gm. was distilled with steam until a distillate of 500 cc. was obtained. In a second experiment, using 1 gm. of acetanilid, 2.4% was found in the distillate.

Determination of Free Phosphorus in Rat Pastes:—The following method works well with phosphorus rat pastes:—Take a sample of about 1 gm., place in a distilling flask connected with a CO₂ generator and a condenser, and connect the condenser with a 300 cc. Erlenmeyer flask containing 50 cc. of 3% silver nitrate solution. Connect the flask with a series of two U tubes containing 3% silver nitrate solution. All connections exposed to the phosphorus must be of glass or of cork covered with plaster of paris. Pass CO₂ through the apparatus for 20 minutes, testing for leaks with flexible collodion, which will bubble at a leak. Place 125 cc. of cold, freshly boiled, distilled water containing 2 cc. of sulphuric acid in the flask containing the sample by means of the tube which leads to the CO₂ generator. Continue to pass in CO₂, and heat the flask gently until, after about three hours, practically all of the liquid in the flask has been distilled into the silver nitrate solution.

Finally, allow the condenser to become hot from the distillation, and disconnect between generator and distillation flask before removing flame. Collect all the silver nitrate solutions in the Erlenmeyer flask, using nitric acid to dissolve the black precipitate in the U tubes. Add 15 cc. of nitric acid to the mixture, boil for five minutes, and add hydrochloric acid, in moderate excess, to precipitate the silver. Boil for 20 minutes, let cool, filter, and concentrate to 150 cc. Cool to 40° C., add 100 cc. ammonium molybdate solution, stir well, and let stand in warm place over night. Filter off clear liquid, wash precipitate by decantation, using 25 cc. water for each washing, transfer to filter, and wash until two fillings of the funnel are rendered pink by one drop of N/2 potassium hydroxide solution, using phenolphthalein as indicator. Place the filter and precipitate, in a glass-stoppered flask, add an excess of N/2 potassium hydroxide solution, shake for a few minutes, add phenolphthalein indicator, and titrate back with N/2 sulphuric acid. Each cc. of N/2 potassium hydroxide solution, is equivalent to 0.0007071 gm. phosphorus.

This method is also applicable to the assay of phosphoretted resin and phosphorus tablets, for free phosphorus. Three samples of commercial phosphorus rat-pastes, were found to contain respectively 57.9%, 41%, and 82%, of the claimed amounts of phosphorus in free condition.

Note on Charging Melting-Point Tubes:—The usual method of taking melting-points involves the use of a capillary melting-point tube, sealed at one end. This type of tube presents the difficulty of requiring the shaking down of the sample, into the closed end of the tube. A capillary tube open at both ends is far more convenient. It may be charged with the sample, to the depth of about one-fourth inch, merely by pressing the end of the tube into the powdered substance in the manner of filling capsules. The tube may then be attached to the thermometer in the usual manner, and used the same as a tube closed at one end. In all our experience with this open capillary tube, the melted sample has always been retained within the tube by capillary attraction. This type of tube permits of the employment, if desired, of a finer capillary tube, as the sample does not

have to be shaken down. It is unnecessary to say, of course, that these tubes can only be used in a melting-point apparatus provided with an air chamber, such for example, as Roth's, they could not be submerged in a water or acid bath.

Lead Storage-Tanks for Pharmaceutical Preparations:—In investigating the suitability of lead-lined storage-tanks for pharmaceutical preparations, the following observations were made:—Tincture of Opium, and Syrup of White Pine Compound, dissolve lead; Tincture of Aconite and Fluid Extract of Ergot, do not permanently dissolve lead, but form precipitates containing lead; Tincture of Vanilla and Aromatic Fluid Extract of Cascara Sagrada, dissolve lead and also form precipitates containing lead.

Note on Soft Gambir:—The U. S. P. requires that gambir be friable, that it contain not less than 70% alcohol-soluble matter and not more than 5% ash. Gambir, when soft, contains excessive water, which is included as alcohol-soluble matter. If the amount of soft gambir used in a formula, is corrected for its excessive water, soft gambir may be used, in place of the friable gambir required by the U. S. P. The point to be considered is the maximum amount of water which gambir may contain and retain its friable condition.

In order to determine this point, a flat cake of soft gambir was alternately heated at 100° C. for fifteen minutes, and then cooled, and the condition of the gambir ascertained when cool. Under these conditions, the gambir became friable when it contained 5.3% of water. This figure, however, was not consistent with the moisture-content of spontaneously-dried, commercial, friable samples, which contained as much as 12% moisture. It is evident, therefore, that the maximum content of water consistent with a friable condition, is variable according to the method of drying. The commercial method of drying gambir, is the spontaneous one, so that the determination of the maximum content of water consistent with a friable condition, should be based on spontaneously-dried commercial samples. The maximum moisture in the samples of friable gambir, which we have examined up to the present, is 12%. The minimum moisture in the samples of soft gambir which we have examined up to the present, is 21%. The proper maximum-content of water in gambir, consistent with a friable condition, to adopt as a standard, should be that which we have found in practice and which is 12%. In valuing soft gambir, the moisture, alcohol-solubility, and ash should be determined and only 12% of the moisture should be calculated as alcohol-soluble matter.

As an illustration, we will consider a soft gambir which assays 25.4% moisture and 74.2% alcohol-soluble matter. The moisture in excess of the 12%, consistent with a friable condition, is 13.4% which should be subtracted from 74.2% alcohol-soluble matter, leaving 60.8% alcohol-soluble matter, exclusive of excessive water for the gambir, instead of the 70% which the U. S. P. requires, thus indicating that 116 parts are equivalent to 100 parts of U. S. P. gambir.

Gambir labeled as catechu, is always friable and for catechu and friable gambir, this method of calculating is not called for. These should assay not less than 70% alcohol-soluble matter and not more than 5% ash. There may be some slight objection to the use of soft gambir on the score of its diluting the menstruum and therefore changing the character of the extractive a trifle. But this

is not likely, as the chief medicinal ingredient is tannic acid and tannic acid is quite soluble in both water and alcohol.

An Improved Form of Steam Bath:—A circular steam bath containing the usual steam coil, constant water-level, openings with accommodating-rings for various-sized apparatus, etc., and with the additional arrangement of having an upright condenser placed in the center of the bath, has many advantages over the usual rectangular-shaped steam-bath without condenser.

The circular steam-bath requires no special explanation, but the upright condenser may be described as follows:

The condenser consists of two cylinders, one within the other, with glass tubes for condensing purposes placed in the space between the two cylinders. These cylinders contain the water used for condensing purposes,—the water entering the inner cylinder at the top, passing through holes in the bottom of the cylinder in to space between the two cylinders,

where it comes in contact with the condensing tubes, and then, passing up through the outer cylinder to the overflow near the top. The inner cylinder is designed for use with ice, when weather conditions require its use.

Flasks containing light solvents, are connected, for the process of distillation, with small spray traps, by means of corks which have been extracted with the kind of solvent undergoing distillation. The spray traps, in turn, are connected with the condensing tubes by means of short pieces of rubber tubing. To prevent loss of substances due to sudden boiling, it is desirable that the inner bottoms of the flasks be scratched with a diamond, taking care not to cut deeply into the glass.

This type of steam-bath has the advantages that it is always ready for the recovery of small quantities of volatile solvents, without the necessity for setting up distillation-apparatus; cold condensing can be conveniently carried out; the apparatus is compact; breakage, such as is common with glass condensers of the ordinary unprotected type, is prevented; the recovery of light solvents, which can be repeatedly employed for the same class of work is encouraged; and finally it may be used as an ordinary steam-bath, when the condensing arrangements are not required.

Cuts of the apparatus accompany this description.

Yuletide.

NOW comes the season of rejoicing. The Day of all Days, when, one and all, the entire Christian people of the earth, join in praise of the Lord of Lords, the King of Kings. The day when every one seems to try to make another glad of life, and the day from which we learn the veritable truth of the saying, "It is more blessed to give than to receive," and find more joy and peace in being kind, true and loving than in being unkind, false and insincere. Would there were more such days. Would that every day, the world's people thought of how they could lift the burden from some fellow-mortal and relieve their wants and their sorrows. How strange that with the joys and memories of one such day to abide with us, there cannot be seen how much better this world would be, if all days were like this one, full of joy and helpfulness to others.

What a different world this Cosmos would be if all, should from to-day, make their best endeavor to free themselves from meanness, from deceit, from wrong and cruel ways. Burns sings to us,—

*"Man's inhumanity to Man
Makes countless thousands mourn."*

when just simply Man's kindness to his fellow-men would make the world a place so joyous, that it would be a foretaste of the Heaven to which we all aspire. A MERRY CHRISTMAS! WHY? Why not a year of Merry Christmases? Why should we make but one, the sum and total of all our aspirations for a kinder and more generous life; then like the dog of Peter II, 22, turn to that by which we are degraded and defiled? "*Love ye one another,*" taught the Great Teacher, whose birth and life we celebrate this day. Not this for one day, but for every day.

We pharmacists follow Galen, "*The Paradoxopaus,*" (The Wonder-worker). Let us be wonder-workers in the world, and do our simple part to make it happier and better. In Italy the beggars greet you with "*Fate ben per voi*" (Be good to yourselves) in asking alms. Let us then seek our own good by doing good to others, and thus maintain the humanity, the worth of our high profession, devoted to the alleviation of the miseries of mankind; not alone the physical, but the mental and the spiritual as well. Thus will we honor our calling and make the name and the profession of Pharmacy revered and honored in the land.

The Journal wishes to every member A Most Merry Christmas!!

E. C. M.

A PLAIN DUTY.

WHAT Professor Kauffman called attention to at the last meeting of the Columbus Branch,—the use of the sodium salts in place of those of potassium,—is one of particular importance to every person, especially to pharmacists.

The supply of sodium in this country is practically inexhaustible, while we are almost entirely dependent upon Germany for potassium, and this fact accounts for the sharp advance in the prices of potassium salts, which will probably be accentuated if the war continues.

Salts of potassium and sodium, are presumed to derive their medicinal value from their combination with their radicals, not from their bases. The iodides and bromides of sodium and potassium have like medicinal uses, and are usually administered because of the iodine they contain, and the slight difference between them in this regard is in favor of the sodium salts. The latter are even preferred by many practitioners.

Merck's Report says:—

"Medicinally, in fact, the sodium salts are even believed to be superior to the potassium salts, because the consensus of opinion accredits the potassium ion with a depressing action on the central nervous system and heart, while the sodium ion is perfectly inert or indifferent. This view is so widely held that many physicians, particularly abroad, prefer the sodium salts (bromide, iodide, etc.,) to the potassium salts, and invariably prescribe them. This fact has not, however, been impressed upon the greater number of physicians, who largely follow traditions in prescribing, and who perhaps are not fully familiar with the sodium salts and their doses."

If physicians were informed on these points by pharmacists, there would doubtless result a greater use of the sodium salts and a lessened one for those of potassium. The doses of the most commonly used salts of these bases are practically identical,—of the iodides and bromides exactly the same. It would seem, therefore, as though it were the performance of a plain duty to the public and to themselves, for druggists to recommend to physicians the use of the salts of sodium instead of those of potassium. At the same time, they would be assisting to render the country independent of any interference with its medicinal supplies, such as has been caused by the existing war in Europe.

E. C. M.

RETAILERS IN THE AMERICAN PHARMACEUTICAL ASSOCIATION.

THOUGH not unfriendly in tone, an editorial in the November number of the Western Druggist entitled "Retailers in the American Pharmaceutical Association," is based upon a false assumption and therefore leads to a wrong conclusion.

An assertion, admittedly made "during a somewhat acrimonious debate" at the last N. A. R. D. convention, affords very slender support for such a sweeping premise as that "a majority of the members of the A. Ph. A. consist of pharmaceutical teachers, pharmaceutical editors, representatives of various departments of wholesale and manufacturing houses and the retired lists of these various interests."

An inspection of the roster of the A. Ph. A. members, quickly disproves this assertion. An actual count of the members in Massachusetts shows that 130 out

of 151 members of that state are engaged in the retail drug-business as proprietors or clerks.

The Chicago Branch, which includes in its membership representatives of the faculties of four schools of pharmacy, as well as a liberal number of chemists, manufacturers, wholesalers and journalists, shows, nevertheless, a decided preponderance of practicing pharmacists among its members. In the smaller cities and throughout the country the percentage of retail pharmacists is of course much greater than in the large centers of industry.

True, many of the most active members of the A. Ph. A. are not engaged in the retail drug business, but more than a few of these are qualified pharmacists notwithstanding. Further, it is to be expected that teachers, journalists, chemists, wholesalers and manufacturers *should* take an active part in the work of the A. Ph. A. More commonly than the retailer, they have the ambition, the time and the training which leadership requires. The strength of the A. Ph. A. lies in no small degree in its ability and opportunity to avail itself of the talents of such men.

The inference, that the Journal of the A. Ph. A. has been a failure is likewise refuted by facts. The Journal has been and is a success—a success not to be measured in the dollars of advertising receipts—especially as the cautious and conservative policy of the Association, does not permit of the acceptance of much of the advertising ordinarily carried in most of the trade journals.

That the Journal has materially helped to increase the membership of the Association may be determined by a comparison of the rate of growth for the nine years before and since the establishment of the monthly. In 1896, the total membership was 1558. Nine years later it was 1776, an increase of 14 percent. The Bulletin, as the Journal was first known, was inaugurated in 1905. During the following nine years—to 1914, the membership increased nearly 50 percent., passing the 2600 mark at the last convention.

W. B. DAY.

OLIVE CROP OF TUSCANY.

The olive crop of 1914-15 for all of Tuscany is estimated to average, with a tendency to increase, the 1913-14 crop, which, according to last statistics, produced 1,064,000 quintals (106,400 tons) of olives, producing 197,000 hectoliters (5,204,159 gallons) of oil.

The cold winter and dry summer, though having somewhat reduced the very promising crop as to quantity, have much prevented the development and spreading of the olive fly (*Dacus olearia*) and other parasites, and the quality of oil is expected to be superior to that of 1913 as a result.

Very little oil of the 1913-14 crop is still on the market—estimated as not exceeding 5 to 6 percent. of the total production.

The oil from the 1914-15 crop will not be on sale until December or January next, and prices (purchases from the producer) are expected to be about as the last quotations, viz., per 100 kilos (220.46 pounds), 200 lire (\$38.60), for first quality; 180 lire (\$34.74), second quality; 150 lire (\$28.95), third quality; and 105 to 115 lire (\$20.26 to \$22.19), for industrial purposes.—Consul Benjamin F. Chase, Leghorn, Oct. 13.

Section on Education and Legislation

Papers Presented at the Sixty-Second Annual Convention

A FORM OF LAW PROPOSED FOR THE REGULATION OF THE ITINERANT VENDING OF DRUGS, MEDICINES AND POISONS.*

J. H. BEAL, SC. D.

The regulation of the distribution of drugs, medicines and poisons by unqualified itinerant vendors is a subject of perennial interest.

Pharmacists and physicians are naturally indignant at the discrimination of the law which imposes many burdensome conditions upon the conduct of their respective callings, but permits itinerant vendors to sell without let or hindrance, not only the so-called domestic or household drugs but also any other combination of drugs, provided their vendors are adroit enough to clothe them with some fanciful title not found in the United States Pharmacopœia or National Formulary.

This discrimination bears with especial hardship upon the pharmacist located in the small town or village. The law requires him to be especially educated for his business, and to be registered by examination. His goods are subject to both Federal and State inspection, and he is liable to severe penalties if they are deficient in quality. He is specially taxed for the enforcement of the laws regulating the practice of pharmacy, in addition to the tax which he pays for the maintenance of the government of the local community. It is small wonder, therefore, that he raises a protest when he sees his business taken away from him by itinerant vendors who contribute nothing to the support of the community in which they do business, who are not qualified by education to judge of the character of the products which they offer for sale, and which products are frequently dangerous to life and health, and still more frequently are of inferior quality.

Numerous efforts have been made to enact legislation restraining or regulating such itinerant vending, and occasionally acts for that purpose have been placed upon the statute books, but have generally been declared void by the court of last resort when attempts have been made to enforce them.

The fault of such attempted legislation has been that it has almost invariably tried to accomplish too much. Under the guise of regulation, it has imposed conditions that practically would have amounted to extermination: and under the pretense of protecting the public health has really attempted to legislate against the business of the man whose store was upon wheels in favor of the business of the man whose store occupied a permanent location. To make such legislation

* Read before the Section on Education and Legislation, at the 61st Annual Convention, Nashville, Tenn., 1913.

valid there must be a logical connection between the requirements which it imposes, and the general public good, and not merely the particular good of the retailer who has a fixed place of business. If this connection with the public welfare be plainly shown, then such legislation will stand a good chance of being sustained by the courts, even if it shall amount to practical prohibition of the itinerant vending of drugs and medicines.

In other words, the only warrant for the imposing of special requirements upon the itinerant vendor of drugs and medicines is the necessity of protecting the public against the sale of fraudulent or dangerous preparations or the collection of necessary taxes; and this necessity must be real and in line with the requirements imposed upon the non-itinerant vendors of the same class of articles, and must not be designed merely to interfere with the business of those who travel from place to place in favor of the interests of those who do business in one place.

The following is proposed as a form of law which the writer believes meets most of the constitutional objections which have been offered to such legislation in the past, and at the same time provides the means of bringing under proper control and subjecting to proper regulations, a variety of itinerant traffic, which without proper regulation, is likely to be dangerous to public health besides being unfair to the qualified and registered pharmacist and physician.

The form given below would, of course, need modification to fit it to local conditions in the states when it was proposed for enactment, as for example, by substituting the name of the state official charged with the enforcement of the food and drug laws, where these are not enforced by the state board of pharmacy, etc.

A BILL

To regulate the itinerant vending of medicines, and nostrums, and of compounds and mixtures containing dangerous or habit-forming drugs, and to provide for the licensing of vendors of the same.

Be it enacted by the General Assembly of the State of

Section 1. Any person, firm or corporation desiring to engage, either as principal or as agent, in the business of selling, or vending by peddling, or by canvassing from house to house, or by vending from valise, pack, bundle, wagon or other vehicle, or by public out-cry, or upon the street or public highway, any drug or medicine, or any combination or mixture of drugs and medicines recommended for the cure, treatment or mitigation of disease, injury or deformity, either of man or other animals, shall apply to the state [board of pharmacy] for a license, or for a certified copy thereof, as provided in section two of this act, authorizing such peddling, canvassing, selling or vending.

Every application shall be in the form prescribed by the state [board of pharmacy] and shall particularly set forth the drugs, medicines, or combinations or mixtures thereof desired to be vended or sold, and shall be accompanied by samples of such drugs, medicines, combinations or mixtures, sufficient in quantity for analysis, the quantity to be such as may be determined by the state [board of pharmacy] and by a true statement of the quantity or proportion of any alcohol, opium, morphine, codeine, heroin, or cocaine, or of any salt, alkaloid, derivative, preparation or compound of any such drugs contained therein, and by copies of the circulars, labels or other printed matter by which such articles are to be accompanied or advertised.

If the state [board of pharmacy] is satisfied that such application is in the proper form and that the drugs, medicines, combinations or mixtures proposed

to be sold or vended do not contain poisonous or habit-forming drugs in greater proportion than is permitted by law, or alcohol in greater proportion than is necessary to preserve or hold the essential ingredients of such drugs, medicines, combinations or mixtures in solution, and that such preparations cannot be used as alcoholic beverages nor to create or satisfy a drug habit, and that they are not dangerous to life, or health, nor intended for unlawful or immoral purposes, and that the circulars, labels or other printed matter by which such articles are to be accompanied or advertised do not contain any statements that are false and fraudulent, [the State Board of Pharmacy] shall upon receipt of the fees hereinafter described, cause to be issued to such applicant a license authorizing the selling, peddling or vending of such drugs, medicines, combinations or mixtures thereof.

Such license shall particularly describe the drug, medicine, combination or mixture authorized to be sold thereunder, the name of the person, firm or corporation to which the license is issued, the date when such license expires, and shall be signed by the [Secretary of the state board of pharmacy].

Nothing in this or in any other section of this act shall be construed to affect the operation of any provision of law regulating the practice of pharmacy, medicine, dentistry or veterinary medicine, or regulating the sale of alcoholic liquors, habit-forming drugs, or of food and drugs, nor shall it be construed to suspend or avoid the operation of any legal ordinance of any municipality regulating the itinerant vending or peddling of drugs, medicines or other articles.

Section 2. The state [board of pharmacy] shall be authorized to charge and collect the sum of ten dollars (\$10.00) for each such license, and if the sale of more than one drug, medicine, compound or mixture is authorized thereunder, they shall be authorized to charge and collect the sum of one dollar (\$1.00) for each additional drug, medicine, compound or mixture. No person, firm or corporation shall be required to procure more than one license for the sale of any preparation, but each agent shall be required to carry with him the license obtained by his principal, or a certified copy thereof, and to produce the same for inspection when requested to do so by any officer of the law, or by any inspector of the state [board of pharmacy] and when more than one agent or canvasser is employed by any person, firm or corporation, the state [board of pharmacy] shall furnish certified copies of such license for each of such agents or canvassers and shall be authorized to charge the sum of one dollar (\$1.00) for each copy thereof. No license shall be issued for a longer period than one year.

The state [board of pharmacy] shall cause a record to be kept of the licenses issued under this act, to whom issued and of the dates of expiration thereof, which licenses shall be consecutively numbered, and all drugs, medicines, combinations or mixtures thereof, authorized to be sold or vended thereunder shall bear a label upon which is printed in plain and easily read letters the words, "Sale authorized by [name of state] License No. ———," accompanied by the serial number of such license and the date when such license will expire.

Section 3. Any person, firm or corporation, who, either as principal or agent, shall sell or offer for sale, by peddling, or by canvassing from house to house, or by vending from valise, pack, bundle, wagon or other vehicle, or by public outcry, or upon the street or public highway, any drug or medicine, or any combination or mixture of drugs or medicines recommended for the cure, treatment or mitigation of any disease, injury or deformity, either of man or other animals, without first having obtained a license from the state [board of pharmacy] as hereinbefore provided, or any one who in any application for license under this act shall state falsely the composition of any drug, medicine, combination or mixture, or when vending by public outcry shall make or utter any statement regarding the articles offered for sale which shall be false or misleading, shall be deemed guilty of a misdemeanor, and upon conviction shall be fined not less than fifty

dollars (\$50.00) nor more than two hundred dollars (\$200.00) for the first offense, and on any subsequent conviction for the same offense shall be fined not less than two hundred dollars (\$200.00) nor more than five hundred dollars (\$500.00).

All licenses and other fees and all fines collected under this act shall be paid to the state [board of pharmacy] and by [them] shall be paid into the state treasury, where they shall be disposed of according to law.

Section 4. It shall be the duty of the state [board of pharmacy] to administer the provisions of this act, to investigate charges of violation of any of the provisions, to prosecute or cause to be prosecuted any person, firm or corporation guilty of such violation and to make such proper and lawful regulations as may be necessary to carry the provisions of this act into effect.

In case it is desired to regulate also the itinerant practice of medicine, the writer suggests the insertion between Sections 2 and 3, of another Section something like the following:

Section 3. Any physician or person having or claiming authority to practice medicine under the laws of this state, and who, not being a legal resident, shall desire to begin or continue the itinerant practice of medicine in this state, shall first obtain authority so to do from the state board of health which (or who) upon proper application in writing may issue a permit for such practice covering a period of one year from date upon the payment of a fee of dollars and the filing of a bond for with good and sufficient sureties residing in this state, to insure against the improper performance of medical service.

Any physician having or claiming authority to practice medicine under the laws of this state, and who being a legal resident of this state, may desire to begin or continue the itinerant practice of medicine may obtain a permit in the same manner as prescribed for a non-resident, but shall not be required to file the bond described in this section.

The state board of health shall upon a proper showing of authority of the applicant to practice medicine in this state, and upon the performance of the other acts named herein, issue the permit for an itinerant physician, provided no permit shall be issued to such physicians as offer to treat diseases of a venereal nature, nor to any physician of known immoral character or intemperate habits.

The state board of health shall at once revoke the permit of any itinerant physician who shall be proven to be of immoral character or intemperate habits, or who shall offer to treat diseases named herein, and in the event of such revocation no portion of the fee paid shall be refunded.

The words "itinerant physician" within the meaning of this act shall be deemed to mean any physician who being a non-resident of the state shall practice medicine from place to place within the state and who shall offer his services in the various localities through public advertising of any nature, or by word of mouth in any street or public place, or who being a resident of this state shall so practice or advertise outside of the county of his legal residence.

The provisions of this section shall apply to any physician so practicing or advertising whether acting as principal, agent or employee.

Each itinerant physician shall carry with him his permit for the current year and shall produce the same for the inspection of any officer of the law or any agent of the issuing authority.

DISCUSSION.

Mr. F. H. Freericks, of Cincinnati, said he desired to express his pleasure at having been present at the meeting a year or two ago of the Academy of Medicine and Ohio Valley Druggists Association of Cincinnati, where Mr. Beal had discussed this question of the itinerant vendor. It became apparent at that time that the physicians were equally interested with the pharmacists of the country in this question, and, subsequent to that meeting, he had met

some fifteen or twenty of the prominent physicians of Cincinnati, who had been present at the meeting, who assured him—and possibly through him the Association—that any effort of this kind would have their very hearty approval. A bill had been introduced at the last session of the Ohio Legislature which, to a great extent, embodied the views here expressed by Mr. Beal. He agreed with Mr. Beal that any effort in this direction must be based primarily on the public good and welfare; it could not be a question of what was best for the druggist, but must always be a question of whether it served the public welfare. He expressed the hope that some method might be found by the author of this bill under which it would be possible to make it applicable to the unqualified vendor, who had a fixed place of business, as well as to the unqualified vendor who traveled around, because there was some doubt as to whether a distinction made as to the itinerant vendor that was not applicable to the vendor at a fixed place, would be constitutional.

Mr. Nixon thought one of the strongest assets the itinerant vendor had was in that clause of the Pure Food & Drugs Act allowing a multiple standard. In his section of the country they had found that these vendors were selling tincture of iodine containing three per cent., which the law allowed. He had a customer to whom he had sold tincture of iodine to bring it back because it stained (!) his hand. It was easy to see where he had been buying the article. He had had physicians tell him the same thing, that they were able to obtain tincture of iodine which would not stain the skin, and that their patients preferred it. Another instance was peppermint. He thought the percentage of essence of peppermint, which was 10, was too high. A lady had brought him back a bottle not a great while ago, saying she had given her child a teaspoonful of this essence of peppermint, and it had nearly strangled the child. She had been buying of an itinerant vendor, and he requested her to bring him the bottle, which she did, and he found it contained only 2½ percent. of oil. Personally, he expressed himself as being strongly in favor of the single standard for Pharmacopoeial preparations.

Mr. Cassaday said that, in Indiana, they had had quite an experience at Indianapolis, at the last session of the Legislature, in getting their narcotic law passed. When it began to be apparent that the bill was to be enacted into law, the question arose as to where the authority to enforce its provisions should lie. Some contended that the Board of Pharmacy was the proper authority, others that it was the Board of Health. The Press took the side of the Board of Pharmacy, as it had control of the sale of medicines, and argued that it was rather out of the sphere of the Board of Health. As had been suggested here, these itinerant vendors were becoming "drug-stores on wheels." The question was, who was going to look after the enforcement of the law as to the sales of medicine and the licensing of those who should sell medicines in the State? Was this authority to be turned over to the Board of Health? It was generally conceded that these boards had enough to do already, and he was ready to enter his protest against any supervision of the sales of medicines in any way by the Board of Health. Druggists were the people best qualified to do this. He thought this could be properly regarded as a matter pertaining to the public health, which should properly be administered through the Board of Pharmacy. If not, druggists might as well turn the matter over to some other association that knew less or nothing about it. He thought the people themselves should make it their business to study and know about these things.

GOVERNMENT AID TO FRENCH CHEMICAL INDUSTRIES.

The French Government, by presidential decree, created a special bureau in the Department of Commerce, for the duration of the war, charged with matters touching the production and supply in France of chemical and pharmaceutical products.

The decree (see *Journal Officiel* for Oct. 19, p. 8355) provides that the duties of the office shall be to determine the amount of existing stocks of chemical and pharmaceutical products, to estimate the present volume of production, and to secure production and distribution for the future. "It is equally its duty," the decree continues, "to develop in France a more intensified production of these same products and to encourage the manufacture of new products." Mr. Behal, professor in the *Ecole Supérieure de Pharmacie* and member of the Academy of Medicine, is named director.—Consul General A. M. Thackara, Paris, Oct. 22.

Section on Historical Pharmacy

Papers Presented at the Sixty-Second Annual Convention

ADDRESS OF THE CHAIRMAN OF THE HISTORICAL SECTION.

DR. W. C. ALPERS.

Chairman Alpers prefaced the reading of his address with the following remarks:—

Before reading my address I will state that during the last year a number of letters, papers, clippings, etc., were sent me from various sources, to be incorporated in the archives of the Association, the most important ones being the following:

Correspondence of the Council during the year 1913, sent by the Secretary of the Council, Mr. England, to General Secretary Beal.

From H. M. Whelpley the following Ebert miscellany was received:—

The license of Albert E. Ebert as a physician; the inventory of Mr. Ebert's store at the corner of Polk and State Streets, Chicago, and his appointment as a member of the Board of Pharmacy of Illinois.

From Francis B. Hayes, former editor of the Druggists Circular, was received the following historical miscellany:—

Press clippings relating to the meetings of the Association held at New York in 1907, and at Richmond in 1900 and 1910 and of the meeting of the U. S. Pharmacopœial Convention held at Washington, D. C., in 1910.

Originals of letters from distinguished pharmacists anent the life and death of Professor C. S. N. Hallberg, originally published in the Druggists Circular. Other clippings on the same subject collected from other journals.

Letter from Prof. J. M. Maisch anent the dispensing of poisons.

Formal announcement, in French, with heavy mourning border, of the death of J. L. A. Creuse.

Engraved card of Monsieur Creuse with his Brooklyn and Paris addresses added,—presumably in his own handwriting.

Photograph of Microscope, with original diagram and description, signed by Hans M. Wilder, of his "gauge for the proper polarizing angle of the block glass."

Manuscript of Hans M. Wilder entitled, "Examinations of Colors, Yarns and Fabrics for Arsenic and Tin," translated from the Rundschau.

ADDRESS.

During the last year the remark has been made by some of our members, and also, in the correspondence of the council, that the Historical Section did not arouse any interest, and might just as well be abolished, in order to shorten or facilitate the work of the Association. I consider it proper and timely, to refute these arguments and point out that the Historical Section is not only useful but necessary for the further development and standing of the American Pharmaceutical Association.

There can be no doubt that there are some among our 3000 members—in fact it would be remarkable if there were not—who take no interest in historical matters at all, whether pharmaceutical, industrial or political, and to whom history in general is a useless science; men who only live in the present, who cannot, and will not, learn from the successes and failures of former generations; men who in the dullness of their own intellect or inflated conception of their own importance, know nothing in this world but themselves, and believe that their own narrow views are sufficient and broad enough for everybody else. We need not listen to the views of such men. If we did we would have to abolish, not only the Historical Section, but all sections; for there are others who hold these same narrow views about the Scientific Section, others about the Commercial Section, and so on. The strength of the American Pharmaceutical Association, however, lies in the fact that it has always embraced all branches of pharmacy, and has devoted equal time, labor and energy to each and every one, thus expounding, promoting and encouraging knowledge, instruction and industrial development, and its true members understand and appreciate this broad scope.

Then the claim is made, that the attendance, at the meetings of the Historical Section is generally small, on account of lack of interest. This charge of small attendance has been true, I regret to say, during the last few years; but the reason for it is not lack of interest, but rather errors of arrangement and management. The programs of the meetings of the last few years, show that the sessions of the Historical Section were put at the end of the meetings, mostly on Saturday. This was probably done without any particular intent, but simply because ours was, until recently, the youngest of all the sections. However, this arrangement necessarily curtailed its attendance, as many members leave for home on Saturday. Another cause of absence, has been the unreasonable extension and adjournment of other sections. If the business of other sections, is not finished in their allotted time, they generally adjourn to Saturday, without paying any regard to those that will meet at the same time. At the Nashville meeting three adjourned-sections met, in this way, on Saturday, that had had ample time before, but either through the leniency of their chairman, or the loquacity of some talkative members, who must be heard on every question, at every section and time, for fear the Association might go to pieces without their garrulousness, they did not finish their business and encroached on the prerogatives of the later sections. No wonder that there is a small attendance, if three adjourned-sections meet at the time allotted to this section.

The importance and necessity of a Historical Section, in an association like ours must be apparent to every thinking member. There is no other association of national character, whether scientific, commercial or political, that does not devote a good deal of its time to this work. Indeed, so important are the records of events considered, that we have numerous associations devoted solely to history; nearly every state possesses one, many counties and cities embrace it in their official work, and, besides these, there is the great National Historical Association. The truth of the word of the great historian, Ranke, that, "History is the court of the world that renders only just verdicts," has long been recognized, and neither efforts nor money are spared to read these verdicts to the people, and to let them learn and profit by them. The study of history is a safe and reliable guide in the progress of all human endeavor, no matter on what field it is employed or to what purpose it is directed.

Among the professions, pharmacy needs this guide more than any other. The aims and purposes of most professions are well defined and clearly laid out; their disciples march, like a closed phalanx, on the straight road that their leaders have pointed out. They may differ as to methods, as to time, as to means, in smaller matters. But they are united and unanimous in their fundamental

principles, and wherever obstacles appear or enemies arise, they offer a firm front and always come out victorious. Not so with pharmacy. Pharmacy is not a science by itself, like Medicine, Theology, Jurisprudence, Mathematics, and others. It is composed of parts of many sciences. It takes from botany, chemistry, medicine, microscopy, and others. It borrows from commercial pursuits and demands high skill and handicraft from its disciples. All these parts it joins together and builds a new structure from them. Such a complex organism cannot endure, unless each part is strong in itself and well balanced in its proportions and importance. No wonder that difficulties and dissensions arise, no wonder that many minds will differ as to the importance of some one part. It is thus that pharmacy easily deviates from her straight and safe course and loses herself in a maze of conflicting advice and efforts. Here History will point out the right way. We can learn from her that these controversies, these aberrations from the straight course, are the natural consequence of its complex character, that they have existed from the very beginning and will forever continue to exist. We will learn that, at every emergency, strong and faithful leaders have arisen, undisturbed by the clamor of the mass, with clear views and courage of conviction. We will learn that many times these leaders have been derided and ridiculed, but that their views finally prevailed. We will learn that pharmacy, like every other science that aspires to truth and justice, cannot succumb to outer influences of a base nature, no matter how strong they may appear. And when we turn to the lives and deeds of the noble men in our profession that shaped its course in the past, we will gain strength, to uphold the high aims of our vocation, and confidence in the final outcome.

Let us place the lives of our best men before the young, and teach them that success in life does not mean wealth alone. Let us create in them, by the examples of those whom we honor, a high conception of their duties and strong impulse to do their very best in their positions, however humble they may be. All can learn from these examples, and in the records of pharmaceutical history, that there are lessons for every member of our profession. By simply reading the proceedings of the American Pharmaceutical Association of past years, we find many instances of every type of pharmacist from the highest scientific man to the strictly commercial drug dealer, each worthy to be emulated, each aspiring to and reaching the aim that he put before himself, each accomplishing success as he understood it.

The manufacturer will find hundreds of hints serviceable to his purpose, in the employment of various methods or the use of tools and machinery; he will learn the wishes and needs of his customers, profit by suggestions and benefit by the inventive minds of former generations.

The source of wealth that lies in the study of pharmaceutical history for the scientific man, is really inexhaustible. There is no subject of the wide domain of pharmacy, that has not been approached in former years; no theory that has not been discussed; no problem, the solution of which has not been attempted. It is true, many of these papers appear crude or unfinished in the light of our present understanding, others that were once hailed as pioneers on new fields, may have turned out wrong since then—but in spite of this, there are lessons in them; they may be regarded as warning signals for the searcher of truth and show which roads to avoid, which thicket to circumvent.

The young man with literary ambition, by reading pharmaceutical history, will not precipitately rush into print, whenever a new idea or problem,—new to him and therefore as he argues to every one,—agitates his mind. He will learn that probably nine-tenths of what he supposes to be new, has been treated by others before him; but, by reading and studying these problems as they appeared to others under other conditions, he will improve his knowledge, correct his judgment and clarify his views.

The greatest gain in studying the history of pharmacy will accrue to the men who compose the bulk of our profession, the practical pharmacists. Whether they look at their vocation as a profession or business they will learn that pharmacy is not a science or occupation the conduction of which can be put down in so many rules or laws; that it is rather a continuous development, that its work and purpose are progressive and constantly changing. Rules of business and industry are always based on surrounding conditions, on the quality of customers, on international trade, on new inventions, new methods of manufacture, new uses and applications of apparatus, and many other conditions, over which neither the individual, nor the united craft, nor even a whole nation, have any influence. History shows us that all these conditions undergo a constant change, and that our rules and methods must likewise change. Stubborn adherence to certain methods, that were good and profitable in past years, is a fight against the inevitable, and neither close combination, nor boycott, nor promises, will check the onward march of such commercial evolutions. History will show us that we must pay attention to these evolutions and adapt ourselves to them. We will thus learn that the most successful men are those who with keen eyes foresaw such changes and prepared their methods, their purchases, their whole business for them. Adaptability should be the leading quality of every successful pharmacist, not stubborn conservatism or reactionary revolution. This is true for the large dealer as well as the smallest apothecary, for the strictly commercial man, as well as the professional pharmacist. And more, we learn that these various men of different type, no matter how divergent their views and aims, might have worked harmoniously together and in combination, each one working faithfully in his sphere, to erect the great structure of pharmacy.

The broad and general knowledge, that History, like a good friend and teacher, thus imparts to every disciple is, however, not the only gain that we derive from its study. We also learn that system and order are of immense importance in another direction, and are thus shown the way to new and necessary work in the interest of our profession. Many times in reading the records of past pharmaceutical history, we are disappointed about the lack of information and dearth of dates concerning some great man or important event. In some instances we do not even know the date and place of birth of some of the pharmacists, who shaped the destinies of our profession; sometimes, also, conflicting views are expressed, and it seems impossible to sift truth from supposition and error. To overcome this difficulty a historical record of every member of our profession should be kept, or if this demand is too broad,—of every member of our Association. Cards should be devised and written giving his birth, education and industrial and scientific development. Dates of membership in this Association and others should be provided, offices that he held, committees to which he belonged, reports that he wrote, addresses that he made, papers and books that he compiled, lectures that he delivered, degrees conferred upon him and other honors that he achieved. The Austrian Pharmaceutical Association entertains what they call a *Gremium*, a combination of a scientific school and business office, where they keep a record of every pharmacist in the large domain of the Austrian empire. True, there are not as many members as there are in the United States, as the number of pharmacists of that country is restricted to a fixed percentage of population. But by systematic and persistent work we, too, might have such valuable records, particularly if the state associations would also take up this work, and thereby divide it in many parts. It seems to me that the Historical Section should undertake this work for the members of the Association, and every new candidate should in future be requested to fill out a question sheet devised for this purpose. It would not take long to obtain this information from the living members, and after that the history of those deceased should be treated in the same way. Such a record, if once completed, would

not only furnish dates and names, but also serves to disclose the inner thoughts, the underlying motive power, that actuated leading men in their doings, which to discover and analyze is the highest and most difficult aim of history.

Together with such records, should go a historical museum. The first historian of this section, Dr. E. Kremers, has contributed valuable papers on the usefulness of such an institution which to repeat does not seem necessary. But as but little has been done, so far in this direction, I again urge the Association to provide some means for this most useful and necessary institution, and to create the position of a custodian, whose duty it should be to collect objects of interest, classify and arrange them and enter into correspondence with all who might be able and willing to contribute to such a collection. The importance of such a museum, and the interest evinced in it, is best shown by the zeal with which traveling pharmacists visit the Germanic Museum in Nuremberg where three different pharmacies representing the 13th, the 15th and the 17th centuries, are exhibited. The articles shown there were contributed from all parts of Germany and every German pharmacist is proud of the collection. Other similar collections may be seen in Berlin, Vienna and Berne, each representing the history of pharmacy of its country. Our country should not be backward, and defer the establishment of a pharmaceutical museum until it will be difficult, or even impossible to collect articles of interest of past years. If the proposition to erect a home for the American Pharmaceutical Association ever becomes a reality, such a house would be the proper place for the museum and historical records. But a beginning should be made now, and a custodian should be appointed, who has time, ability and inclination to perform this work and who can give it a temporary abode.

I therefore recommend that such a custodian be appointed by the council or the work of the historian be extended and sufficient funds be appropriated to carry out the work in a dignified and proper way.

Before closing my address I consider it my duty to express my sincere thanks to our Secretary, Mr. F. T. Gordon, who has filled this important office for a number of years with most praiseworthy zeal and remarkable ability. It is owing to his energy that the sessions of the Historical Section have been crowned with success in past years. I also thank our Historian and all members who have contributed in such able manner to the archives of this section and to the members of the Association in general for their faithful attendance and interest.

REPORT OF THE SECRETARY.

The work of the secretary for the past year has chiefly been the soliciting of contributions from members on topics of historical interest to pharmacy and the collection of historical material. The suggestion made at the Nashville Meeting, that the collection of pharmaceutical journals and daily newspapers containing reports of the meetings of this Association, has proven successful, and I have received copies of all the leading pharmaceutical journals of that period, which will be extremely valuable in future years, through the photographs and personal items concerning members and their activities. I wish to express my thanks, and that of the Association, to those editors who have so willingly complied with the request for copies of their journals. We are so accustomed to throw aside newspapers and other printed matter that we often overlook the importance it will have to future students of the history of pharmacy. There is no doubt as to the value of such material, but WHERE ARE WE GOING TO KEEP IT? If we, of the present day, really wish to add material to the building of the temple of pharmacy we must have a place to put it, and not let it be scattered in all parts

of the country. For the preservation of historical material alone, we are absolutely obligated to establish some permanent home or place where the vast collection of personal and scientific data may be available to the student and historian.

This brings me to the greatest difficulty I have met in obtaining material of historical value. Plenty of such material is offered but who will take care of it, who will arrange it so that it will be available? It is not fair and it is, certainly, not creditable to the American Pharmaceutical Association that it should solicit contributions of historical material and then leave their safekeeping to volunteer members in all parts of the country. How does the man who sends us rare photographs, priceless documents and mementos of friends dear to him know what will be done with them? I confess, myself, that I prefer to keep my own collection of historical material where it can be seen and utilized, instead of consigning it to the oblivion of a packing case, located—WHERE? This question of providing a home, headquarters or whatever it may be called, is now the vital one before this Association and the sooner it is attended to the better. We claim to be the guardians of American pharmacy, its past, present and future guides, but, if this claim is to continue, we must assuredly provide a home for the guardian and not let him depend upon the chance hospitality of a stranger. *Ipse facit?* Not if history is true.

The following recommendations as to continuance of the work of this Section are made, based on my experience of the past two years: 1. That state pharmaceutical associations be requested by the secretary of this Section, through their proper officers, to furnish a copy of the printed proceedings of their annual meetings for inclusion in the Historical Collection of this Association. Such material should be obtained by the secretary and transferred to the care of the Historian as convenient. But once again, where will it be kept?

2. That the secretary request copies of the American Pharmaceutical journals containing reports of the annual meetings of the American Pharmaceutical Association, the National Association of Retail Druggists and other national associations connected with pharmacy, in all its branches, and that these shall be sent to the Historian as part of the Historical Collection. Again, where?

3. That such foreign and American publications devoted to pharmacy, as may be received in exchange by the Editor of the Journal of the Association, be ultimately forwarded to the Historian for inclusion in the Historical Collection.

Our chairman has outlined plans for collection and preservation of other historical material in his address, therefore I will close my report by recalling the fact that history is being made now, that will profoundly affect the world, and that our members have an opportunity for laying the foundations of a mighty temple of truth in the history of pharmacy. Until such time as the Association shall provide a suitable place for safe keeping and exhibition of the historical material contributed, I will gladly take care of any sent me and will try to preserve it for future installation in our "Home."

The expenses of this Section have been chiefly for postage and printing, the total amounting to something less than \$10.00. All bills have been paid and vouchers are in the files of the General Treasurer.

Respectfully submitted,

F. T. GORDON.

HISTORIAN'S REPORT.

CASWELL A. MAYO.

I beg leave to present the following photographs:

1. House of William Procter, Jr., Mount Holly, N. J.
2. A. Ph. A. members at Mammoth Cave, on the return from Nashville meeting, 1913.
3. E. H. Lowe and Dr. W. C. Anderson.
4. Members of Detroit Executive Committee for the A. Ph. A. meeting, 1914.
5. Members of the N. Y. State Ph. A. at Catskill Mountain House, June, 1913.
6. Thanksgiving Day, 1913. N. W. D. A. Convention at Miami, Fla.
7. Microscopic Laboratory of the New York College of Pharmacy.
8. Members of the Nashville Committee for the A. Ph. A. meeting, 1913.
9. Two Photographs of the College of Pharmacy of the University of Minnesota. (Crude Drug Drying Closet and Section of Pharmacognosy Class Collecting Digitalis Leaves.)
10. At the grave of William Procter, Jr., Mount Holly, N. J., on the 97th anniversary of his birth.
11. Two Presidents at Niagara Falls—John G. Godding, H. B. Guilford.
12. W. S. Richardson, wife and two daughters, both of whom have the title of Doctor of Pharmacy.
12. Members at the Niagara Falls meeting of N. A. R. D., 1911.
13. Officers of the Illinois Ph. Association.
14. Officers of the Chicago Retail Druggists' Association—B. A. C. Hoelzer, Isham M. Light, and James B. Crowley.
15. At Plymouth Rock, American Pharmaceutical Association meeting, Boston, 1911.
16. Mrs. Brunstrom, of Moline, Ill., and other ladies, at N. A. R. D. meeting.
17. John W. Lowe, S. N. Jones, W. C. Anderson—three members who have attended every meeting of the N. A. R. D.
18. The Chicago Delegation, with the Niagara Falls for background.
19. Mr. and Mrs. Matthew White.
20. Mrs. Phil. Forbirsh, of Tampa, Cuba, and her sister.
21. Officers of the Illinois Pharmaceutical Association—Ralph Doehrland, Duncan, Charles Aschelpohl and Jim Wells.
22. Delegates from Illinois?
23. Otto Hottinger and Charles Huhn with little nephews at Detroit depot on way to Niagara Falls.

59. Dr. Reid Hunt and Dr. J. J. Abel, Prof. of Pharmacology, Johns Hopkins University, Baltimore, at the E. I. C. of A. C.
60. Dr. Carl Duisberg, Dr. John H. Findley and Herman A. Metz at the E. I. C. of A. C.
61. Dr. Charles Baskerville, Dr. S. A. Tucker, Dr. A. S. Cushman and Dr. E. Coggeshell at the E. I. C. of A. C.
62. President Nichols and Sir William Ramsay on the Steamer Excursion at the convention of the E. I. C. of A. C.
63. Four U. S. Government chemists—Dr. W. D. Bigelow, A. Seidell, E. W. Boughton and F. C. Cook, at the convention of E. I. C. of A. C.
64. Three American chemists—Prof. J. P. Remington, Dr. S. P. Sadtler and Dr. W. E. Hillebrand at the convention of the E. I. C. of A. C.
65. U. S. Military Academy at West Point as seen from the steamer.
66. Portrait of Sir William Ramsay.
67. Newspaper print of Dr. R. Prescott, first dean of the School of Pharmacy of the University of Michigan, with history of the school.
68. Correspondence of the Council during 1913, contributed by J. H. Beal, Scio, Ohio.

I also beg leave to present the following items of interest :

Labels used by Professor Hallberg.

Circular sent to the pharmacists of Maine in connection with the A. Ph. A. meeting at Montreal.

Annual "Round-Up" issued by students of Baylor University. College of Pharmacy, Dallas, Texas.

Story of Philo Carpenter, Pioneer Druggist of Illinois.

Souvenirs of the Milwaukee meeting of the N. A. R. D.

Views of the University of Minnesota.

ATTAR OF ROSES FROM BULGARIA.

American purchases of attar of roses increased from \$580,783 in 1912 to \$791,370 in 1913. Much of this comes from Bulgaria. Consul General C. C. Campbell, Jr., of Bucharest, Roumania, sends a list of the principal Bulgarian exporters of attar of roses, which may be had from the Bureau of Foreign and Domestic Commerce, at Washington, or its branches. The list was prepared by A. C. Kermekhtchieff, American consular agent at Sofia, Bulgaria. In transmitting it he calls attention to the advantage which would accrue to the American importers of this article if an agency were established in Bulgaria to purchase the essence direct from the producers instead of from the exporters.

PHARMACEUTICAL HAPPENINGS A CENTURY AGO.*

OTTO RAUBENHEIMER, PHAR. D.

In accordance with my promise, as former Chairman of the Historical Section, the writer presents the following historical paper on Pharmaceutical History, which he trusts will prove of interest to all pharmacists.

The year 1814 practically ended the career of the Emperor Napoleon I, to whom pharmacy must be always grateful for the establishment of military and hospital pharmacists in his *Grande Armee*. Many, a great many, of the pharmacists, most celebrated in France, began their career as such, in the armies with which Napoleon waged his conflicts.

In this paper the author has divided the subject into three parts:

1. Pharmaceutical Happenings in 1814.
2. Men, especially pharmacists, born in 1814.
3. Those who died in 1814 and whose names should be remembered by pharmacists.

HAPPENINGS IN 1814.

WOLLASTON.

W. H. Wollaston the English physicist and chemist, regarded Dalton's *atoms* as "Equivalents" only.

FRAUNHOFER.

Joseph Fraunhofer, Ph. D., published his memorable work on the solar spectrum, in the Denkschrift of the Muenchener Academie, Band V. 1814-1815. He was the son of a glazier and was born March 6, 1785, at Straubing. He served as apprentice with Weichselburger, the celebrated mirror-maker of Munich. In 1806, he became optician in the mathematical institute of Reichenbach and, in 1809, he became a partner in the establishment. It was here that the work on the solar spectrum was done and that the fixed lines of the spectrum were first determined and were used to measure refraction. Fraunhofer died on June 7, 1826, at Munich.

SATTTLER.

In this year the German Chemist, Sattler discovered at Schweinfurt, Bavaria, the celebrated green mineral color named after that place. Chemically, it is a double salt of copper acetate and copper metarsenate, $\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2 + 3\text{Cu}(\text{AsO}_2)_2$.

Besides its original name, *Schweinfurt Gruen*, it is also called *Kaiser*, *Wiener* or *Pariser Gruen*. It was used extensively as a color, but has since gone out of use, being very poisonous due to its arsenic content. The original process of manufacture was kept a factory-secret, until Liebig, and later Braconnot, published the formula and process of manufacture.

In 1814 Louis Nicolas Vauquelin, the celebrated French pharmacist accomplished the separation of the metals of the platinum group.

In the same year Gay-Lussac discovered Chloric Acid, HClO_3 , that great oxi-

* Read by title before the Historical Section at the Detroit meeting.

dizing agent. It is well to remember that Potassium Chlorate KClO_3 was previously discovered by Higgins in 1786.

BORN IN 1814.

FRÉMY.

Edmond Frémy (1814-1894) is a descendant of a family of celebrated French Apothecaries. His grandfather was a pharmacist in Auxerre, who died in 1804 and his father was the celebrated Edmond François Frémy, who together with Courtois, the discoverer of iodine, and Thenard, the discoverer of hydrogen peroxide, worked under the celebrated French pharmacist and chemist Fourcroy.

Edmond Frémy was noted for his investigations on Alpha and Meta Stannous Acid and also the Ferrates. He was the first to prepare Potassium Metantimoniate KSbO_3 or Kali Stibicum, also known under the name of Antimonium Diaphoreticum, prepared by fusing together Antimony and Potassium Nitrate. In 1854 he originated the method of Fluorination, and, in 1869, he first prepared pure anhydrous Hydrofluoric Acid.

Like his father he also became Professor of Chemistry in Paris.

MAYER.

Julius Robert Mayer was born November 25, 1814, in Heilbronn, Germany. In his "wanderlust," he made a voyage to Java on a Dutch ship. Later on he became city physician in his native town.

His numerous works on physics were published in Liebig's *Annalen* from 1842 to 1851, which also printed his celebrated "Dynamic of the Heaven" in 1848. His most important work, however, was on the "*Mechanical Equivalents of Heat*," published in the same journal in 1851. Julius Robert Mayer's greatest credit however, is in the establishment of the "Law of the Conservation of Energy," and his name will continue to live forever in the science of physics.

Like many other of the illustrious brain workers, Julius Robert Mayer died in an insane asylum in 1858.

SCHACHT.

George Frederick Schacht (1814-1896) was the descendant of a celebrated German family of apothecaries and became one of the best known and most intelligent German Apothecaries in England.

About 1840, he became the owner of a pharmacy in Bristol and later a member of the firm of Giles, Schacht & Co. He was elected Vice-President of the Pharmaceutical Society of Great Britain, and during 25 years served as a member of the Pharmaceutical Council. Schacht was very active in professional and scientific pharmacy and also in other literary work.

In 1858 he originated "Plasma," which he brought forth as a substitute for ointments, possessing emollient and demulcent properties without having the disadvantage of being greasy. He published this formula in the *Pharmaceutical Journal*, 1866, page 210, as follows:

Powdered starch . . . 70 grains.

Glycerin . . . 1 fluid ounce.

Heat to 240 degrees F. with constant stirring until union is affected.

This preparation was adopted into the British Pharmacopœia as *Glycerinum*

Amyli, into the U. S. P. as *Glyceritum Amyli* and into the German and other Pharmacopœias as *Unguentum Glycerini*.

About 1865 he originated *Liquor Bismuthi*, which was adopted by the British Pharmacopœia in 1867. It has frequently been stated that the official preparation differed from the proprietary article in taste and action, because it was not entirely free from Nitric Acid. In 1885 this solution was then prepared from Bismuth Citrate and Ammonia Water and was made official as *Liquor Bismuthi et Ammonii Citras*.

George Frederick Schacht died in 1896, and with his passing away England, as well as the entire pharmaceutical world, lost one of its most scientific men.

TRAPP.

Julius von Trapp, one of the most, if not the most, celebrated men in Russian pharmacy, was born in 1814 in Mariampol, Poland, as the son of an apothecary who immigrated from Prussia. He was educated at the German gymnasium in Tilsit, Prussia, where he entered Maurach's Apotheke and passed his examination as apprentice in 1836. He studied in St. Petersburg and passed his examination as "Provisor," in 1842. In the following year, he became assistant to the Professor of Pharmacy and Chemistry at the Imperial Academy. In 1848 he obtained the degree of *Magister Pharmaciæ* and passed his State Board Examination. He remained in the service of the government all his life, and was very highly honored, obtaining the following titles: *Hofrat*, in 1852, *Staatsrat and Excellence*, in 1863, and *Geheimrat*, in 1870.

It is said that the starting point of Trapp's political-pharmaceutical career, was the serving of a glass of water to a lady of nobility, on a railroad train, who through this incident became his patroness.

Between the years of 1858 and 1877, he was Professor of Pharmacy, Pharmaceutical Chemistry, Pharmacognosy and Toxicology at the Medical-Chirurgical Academy of St. Petersburg. He became President of the Pharmaceutical Association of St. Petersburg and was a State Board Examiner for a great many years. It was said that Dr. Trapp in the latter capacity was very fond of "trapping" the candidates.

The University of Königsberg bestowed upon him the Honorary Degree of Doctor, and about 30 scientific societies made him an honorary member.

February 12, 1893, marked the fiftieth anniversary of Trapp's career as an educator. This fiftieth jubilee was celebrated in a very elaborate manner and numerous presents were received from all parts of Russia as well as foreign countries. At the same time, Trapp received a beautiful diploma making him an honorary member of the Russian Academy.

Julius von Trapp was very active in a literary way. He wrote numerous papers and books which are standard works to-day, especially in Russian pharmacy. A great many of his works have also been translated into German. The following is a list of the most important: *Hospital Pharmacopœia*, 1860; *Pharmacopœia Militaris*, 1866; *Pharmacognosy*, 1858 and 1868; *Flotten-Pharmacopœia*, 1869; *Pharmacopœia of the Imperial Court Apotheke*, 1871; *Toxicology*, 1876; *Prescription Dispensing*, 1877 and 1880.

Besides this, he has been an active member on the Revision Committee of the Pharmacopœia Rossica of 1867, 1870, 1880 and 1891.

The name of Trapp will live forever in pharmacy of Russia, as well as throughout the entire world.

ANKUM.

Christian Hendrik van AnKum (1814-1888) was one of the most celebrated pharmacists in Holland. He was born October 16, 1814, in Dalfsen. In 1828, at the early age of 14 years, he entered the apotheke of Van Giffen in Steenwyk. Here he began his pharmaceutical career and learned the fundamental principles of applied chemistry, in which he later became a true master.

He studied at the University of Groningen, under the celebrated Professors Hall and Stratingh. In 1835, he passed the State Board Examination and became assistant in the laboratory of the University. It was here he accomplished his work on the Iodine content of Cod Liver Oil. He married in 1842 and became the owner of a pharmacy.

He was active in scientific pharmacy and was an honorary member of different pharmaceutical and scientific societies. He was also a member of the Revision Committee of the Pharmacopœia Nederlandica II and III. From 1865 until 1884, he was a member of the Board of Pharmacy in Groningen. AnKum was very modest and even went so far as to decline the chair as Professor of Chemistry at the University. In 1878 he celebrated his golden jubilee or his semi-centennial as pharmacist. On this occasion the King of Netherlands made him "Ritter of the Loewenorden." At the same time the pharmacists throughout Netherlands sent him a substantial silver present, which was delivered by a special delegation.

The name of AnKum together with Haaxman and Opwijrda will forever designate the *coryphees* of pharmacy in the Netherlands.

DIED IN 1814.

THOMPSON.

Sir Benjamin Thompson, Count Rumford, was born on March 26, 1753, at Rumford, N. H., which place has been re-named Concord. In 1772, he became a school teacher at Bradford, Mass., and then at Rumford, N. H. It is not to the credit of this American that he enlisted in the British army and fought against the Patriots. In 1783 he went to England and there was made a "Sir." In 1785, he went into the service of Karl Theodor, by whom he was made a Count. In 1798 he began his memorable work on "Heat by Mechanical Means," and in 1799 he returned to England. Rumford certainly had the "wanderlust" as in 1802 he went to Paris and, in 1805, married the widow of Lavoisier, that great chemist and founder of the new chemistry. In 1809, he became separated from Madame Lavoisier and then continued again his scientific work.

Count Rumford should also be known to pharmacists, because as early as 1813 he used a method resembling our present percolation for preparing coffee. This is fully described in his Eighteenth Essay in the Repertory of Arts for April and May, 1813.

Count Rumford deserves special credit for being the first to ascertain that liquids

can be boiled by means of steam. He was a very prolific writer and his works are published as "Essays, Political, Economical and Philosophical," in three volumes, London, 1796-1803. His works are also published in French and in German.

In 1796 he endowed the Royal Society of London and the American Academy of Arts and Sciences with a considerable sum for a prize medal for practical and utile inventions.

In 1810 he founded the London Royal Institution.

Sir Benjamin Thompson died August 21, 1814, at Auteuil near Paris. Rumford Hall, the lecture room in the Chemists' Club in New York City, is named after this scientist and is adorned with his bust.

A BRIEF HISTORY OF THE HOMŒOPATHIC PHARMACOPŒIA AND SOME COMMENTS THEREON.

FREDERICK T. GORDON, B. SC.

It will doubtless surprise many of our members to be told that the homœopathic school of medicine has a pharmacopœia which is just as carefully revised and edited, as is the United States Pharmacopœia under the direction of a permanent body, the American Institute of Homœopathy, an association corresponding to the American Medical Association, in its relation to physicians and surgeons of the homœopathic school.

I have had the opportunity lately of observing the homœopathic practice of pharmacy and its study has been so interesting and full of valuable information, that I am sure it will interest others and that a brief history of its origin and development will be appropriate for inclusion in the contributions to Historical Pharmacy from this Section. We know very little of homœopathic pharmacy, as practitioners of allopathic pharmacy, but such knowledge should be a part of our equipment: "*Pharmacistus sum et nil pharmacopœiae mihi alienum est*" should be our motto. I hope that some member will contribute a history of Eclectic Pharmacy at our next meeting, to round out our archives.

Most of us trained in the allopathic school look somewhat derisively upon the homœopathic materia medica, as nothing but little sugar pellets, or infinitely diluted tinctures or triturations of drugs, but this is a very mistaken idea; the homœopathic pharmacist must be acquainted with many drugs, their constitution and methods of preparing them for medicinal use and the proper form in which they should be prepared. The essence of homœopathic medication being simplicity, the administration of a single drug at one time, the homœopathic pharmacopœia does not contain mixtures such as are given in our pharmacopœia.

All preparations are made from a single drug as tinctures or triturations and then diluted or exhibited as powders, globules, etc., etc. In fact, the homœopathic pharmacopœia is more the materia medica of homœopathic practice than a pharmacopœia such as the U. S. P.; the drugs are described singly, directions are given as to the quantities to be used for making the mother tincture or first trituration

and the dilutions or attenuations to be made from these. General methods are described and directions are given for preparing each class, which apply to all the drugs included in the official list, so that the pharmacist is never in doubt as to the proper method of preparing remedies from crude drugs. This simplicity and the rigid rules laid down as to methods of preparing tinctures, triturations, etc., makes uniformity in strength and appearance possible, much more easily than does the manufacture of compound preparations containing several drugs. The only drawback to absolute uniformity is the lack of assay methods in the homœopathic pharmacopœia. Tests for many chemicals are given, but no assay methods for vegetable drugs, which constitute the larger part of homœopathic materia medica nor for inorganic salts. Serums are not mentioned, although used freely by homœopathic practitioners. Many animal products are official, also preparations derived from insects (*apis mell*), and snakes (*lachesis*).

If the digression will be pardoned, I would like to say that I am beginning to believe that Hahnemann was a prophet in his theories as to the principles of drug action, his theories, considered in the light of latter day scientific discoveries, are startlingly near to what modern science has partially proven. For instance the famous text, "*Simila similibus curantur*," (like cures like), is the basis of modern serum therapy. We give antitoxins prepared from the very germ that causes the disease. Is not that like curing like? Hahnemann's theory was that a drug that would cause certain effects in the healthy body, would counteract the same conditions if caused by disease. Where is the difference? Again, his theory of attenuation, is but the ionic theory of dissociation applied to drugs. Homœopathy does not teach that the more diluted a drug is, the stronger it is, as is believed by many, but it does claim that a drug is rendered more potent by minute sub-division than if administered in masses. This is the ionic theory, that the activity of a salt is proportionate to the dissociation of its molecules or atoms into electrons or ions, the homœopathic theory is, that the more minutely the particles of a drug are divided the more points of active contact, or absorption, it will have. This theory is the basis of homœopathic pharmacy,—division of the drug into the most effective number of minute particles, each of which is free to exert its action without being hampered by inclusion in a comparatively large mass with few free particles. Contrary to another erroneous belief, homœopathic pharmacists do not claim infinite divisibility of a drug, they recognize that it is impossible to subdivide a drug into particles of infinitesimal or molecular size and that each drug has a limit as to sub-division and size of particles in tincture or in trituration. It is not for me to express an opinion as to the truth or error of the two schools of medicine, these comments are made in hope of correcting misapprehension as to the practice of homœopathic pharmacy.

History.—The first publication that may be called a homœopathic pharmacopœia was Hahnemann's "*Fragmenta de viribus medicamentorum positivis sive in sano corpore humane observatis*," published in 1805. This was followed by his "*Materia Medica*" and "*Chronic Diseases*," published in parts, between the years 1811 and 1832. In 1832, was published his "*Archiv*" which contained much material from the preceding works. In all of these, directions were given for the preparation of remedies. The first homœopathic dispensatory was written by Caspari and published at Leipsic in 1825, German being the language used. A

revision of this work was published in 1828. The year 1829 was a period of great activity among homœopathic writers, the first distinctive homœopathic pharmacopœia being compiled and published by Hartmann, at Leipzig, in German, a revision of the Homœopathic Dispensatory by Caspari, (German) and homœopathic pharmacopœias prepared by Belluomini and La Raja, the two latter being printed in Italian. The first Latin pharmacopœia was published in 1834, being a translation of Caspari's revised dispensatory. The first pharmacopœia written in French was compiled by L. Noirot and Ph. Mouzin and was published in Paris and Dijon in 1835. The first homœopathic pharmacopœia written in English, was a translation by Dr. James Kitchen, of Philadelphia, from the *Nouvelle Pharmacopée et Posologie Homœopathique* (French) of Jahr, Paris, 1841, published in Philadelphia in 1842, pp. 306. Numerous revisions of older works and several new works were published in various languages between 1833 and 1842, German, French, Italian and English being the languages employed. Jahr's pharmacopœia was published as a Spanish translation, edited to date, in 1847 (Madrid) and as a French edition in 1853. In 1845, Gruner issued a very complete work on homœopathic pharmacy and materia medica (German) which served as a standard with the works of Jahr for several years. Later, 1850, Jahr and Gruner collaborated in the compilation of a new homœopathic pharmacopœia which was the most complete work of its kind at that date and which, translated into many languages, served as a text book for many years. The first American edition was a translation by Dr. Charles J. Hempel, published in New York in 1850, under the title, "New Homœopathic Pharmacopœia and Posology." This gave detailed instructions as to the preparation of homœopathic remedies and their dosage. From 1850 to 1865, numerous works on pharmacy were written and published and many revisions of the works of Caspari, Gruner and Jahr were issued by various collaborators. Most of these were written in French and German, Spanish being second, Latin third, Italian fourth, English fifth, as to languages employed. A complete bibliography of the works on homœopathic pharmacy and materia medica published between 1805 and 1865 may be found, by those wishing to go into further details, in the third edition of the *Homœopathic Pharmacopœia of the United States*, revised edition, 1914, and the mere recital of titles would be of little interest here.

Previous to 1870, all the various pharmacopœias and dispensaries were unofficial, that is they were the work of one or more men of high standing in homœopathic medicine, and they were accepted as text books and standards, because of the eminence of the authors and their collaborators, and of the editors of revisions of the original work. They might be compared, in a way, to our Dispensatories. The first homœopathic pharmacy to be issued officially, under the auspices and sanction of a recognized homœopathic association, was the *British Homœopathic Pharmacopœia*, published by the British Homœopathic Society, London in 1870, pages 336. This was revised and a second edition issued in 1876, many new drugs being added to its materia medica. The first American *Pharmacopœia* was published in the same year, 1876, by Duncan Brothers, Chicago, under the title, "The United States Homœopathic Pharmacopœia." This was an adaptation of the *British Pharmacopœia* and contained a section devoted

to pharmaceutical processes, and methods and directions as to the nature and strength of its preparations. The next important date is 1880, when a "*Pharmacopœia Homœopathica Polyglotta*" was compiled and published by Schwabe. This work was written in German in the original, and this text was translated into English, French, Italian, Spanish and Dutch, the entire work being issued in several volumes. This was a very ambitious work and chapters were added by each collaborator covering materia medica and pharmaceutical practice in the various countries in whose languages the volume was written.

Homœopathy, at first bitterly opposed in this country and in England, was confined chiefly up to 1860, to continental Europe but after that year it steadily increased in popularity in both countries and hence we find greater activity in the publication of works on homœopathic medicine and pharmacy. The third edition of the British Homœopathic Pharmacopœia was issued in 1882 and a "Companion" or dispensatory in the same year. The first edition of the American Homœopathic Pharmacopœia was published, also in 1882, by Boericke and Tafel, New York and Philadelphia, compiled and edited by Dr. Joseph T. O'Connor. Subsequent revisions were made and published in 1883, 1885 and 1890 and succeeding years. The last revision, the ninth, having been issued recently. The publication of this work caused some confusion and much controversy, in early years, as there were now two homœopathic pharmacopœias for the United States, differing to some extent in the materia medica included, and as to systems of dosage, dilutions, etc. As the pharmacopœia issued by the American Institute of Homœopathy had not been revised since its first appearance, 1876, naturally the later work was given preference by the majority of physicians and pharmacists of this school; and it continued to be the practical pharmacopœial authority until 1897, when the Homœopathic Institute issued a second revised edition of its original pharmacopœia. A dispensatory was published in 1884 by Dr. Theodore Williams, Chicago, under the title the "American Homœopathic Dispensatory," which was similar to our dispensaries in that it gave much medical information as to the materia medica as well as to its pharmacy. In 1897 the efforts of the American Institute of Homœopathy to compile and publish a pharmacopœia that would be the official standard for homœopathic practice and a text book in such schools was crowned with success and the "Pharmacopœia of the American Institute of Homœopathy" was completed and published. This book represented the work of years by a special committee appointed by the Institute, and was most complete both as to its chapters on pharmacy, pharmaceutical practice and materia medica. This was accepted as the official homœopathic pharmacopœia by most practitioners and colleges. France and Germany followed the example of the United States in issuing an official pharmacopœia sanctioned by the national association of homœopathic physicians and surgeons, the French Pharmacopœia being published in 1898 and the German in 1901. Both works represent the most advanced pharmaceutical practice of the two countries and were prepared much as our own pharmacopœia is, by committees of revision appointed by the associations representing homœopathic practice. The British Pharmacopœia has also been revised several times and has a similar official status.

This brings us up to the date of the last revision of the pharmacopœia in this country, the "Homœopathic Pharmacopœia of the United States," published as

the third revision of this work, in 1914, under the sanction of the American Institute of Homœopathy. Previous editions were published in 1897 and 1901 under the same title. The present work is divided into three sections: Part I—General Pharmacy; Part II—Materia Medica; Part III—Tables of Reference, Index, etc. It is a most comprehensive work on homœopathic pharmacy and compares very favorably with the United States Pharmacopœia in its particular field, its section on materia medica being especially well written and complete as to description, history and other data. This pharmacopœia is now recognized as occupying the same official standard for homœopathic practice as is the U. S. P. in its sphere, and is the official text book of homœopathic colleges where pharmacy is taught as part of the curriculum. Every homœopathic physician is supposed to know how to prepare his own remedies if necessary, hence a thorough course in its special pharmacy is a necessary part of his education. It is desired by many homœopathic physicians that this pharmacopœia be given the same legal standing as an official standard for drugs used in their practice as is given the U. S. P. and doubtless this will be done in the near future as at present there is no legal recognition of this work as presenting the standard requirements of drugs used by homœopaths.

The greatest obstacle to sanctioning the homœopathic pharmacopœia as a legal standard for homœopathic drugs is its lack of definite standards and assay methods. As the greater part of its materia medica is composed of vegetable drugs, for which no method of analysis or standardization has yet been worked out, the only test possible for these would be botanical identification, but definite assay methods for many potent drugs, such as aconite, belladonna, hyoscyamus, etc., are available and doubtless will be adopted in future revisions. There are no assay methods or rubrics of purity and strength for mineral or vegetable drugs, the tests given being chiefly identity-tests and for the detection of the usual impurities. The strength of liquid and solid preparations is, however, rigidly stated and each drug is treated separately in prescribing the menstruum for extraction, the quantity of fresh or dried drug to be used for tinctures or triturations and the dilutions or attenuations given. One feature is worthy of inclusion in allopathic practice, that of basing the quantity of menstruum used, for the extraction of plant principles, upon the amount of water contained in the green or dried drug. When the plant is used in the fresh state, a portion is taken, carefully weighed, dried and the amount of plant moisture estimated by the loss in weight. This plant moisture, is considered as part of the menstruum and allowances are made accordingly. For example, the mother tincture of aconite is made by the following formula: Aconitum, moist magma containing solids 100 gm., plant moisture 350 cc.; strong alcohol (95%) 683 cc.: to make 1000 cc. of mother tincture. Dilutions: 2 X to contain 1 part of tincture, 2 parts distilled water and 7 parts alcohol; 3 X to be made with one part of 2 X dilution and nine parts of dispensing alcohol (88% alcohol by volume). Triturations are made with milk sugar solely, although cane sugar globules are used for making dry pellets from liquid preparations. These are prepared by adding the required quantity of tincture to a given number of globules to saturation, then evaporating the excess of menstruum by drying.

Homœopathic pharmacy recognizes but four menstua for use in preparing

crude drugs for administration, these are alcohol, glycerin and water for fluid preparations and sugar of milk for triturations. The fluid menstrua differ in the proportions of alcohol, water and glycerin used, combinations best adapted to exhaust the plant-drugs being carefully worked out and specified for each drug. Milk sugar is used for making triturations and attenuations from both solids and tinctures because of its hardness and inertness, the gritty crystals of milk sugar aiding materially in breaking up the drug into minute particles. It is surprising to what minuteness such refractory substances as silica and the metals, can be subdivided by repeated dilutions and trituration with milk sugar; the particles are almost microscopic. A good magnifying glass is part of the equipment of the homœopathic pharmacist, for he must subject his triturations to scrutiny with a magnifying lens to determine if he has reduced the drug to the requisite fineness.

While not mentioned in the homœopathic pharmacopœia, except as addenda, homœopathic pharmacy also includes the preparation of ointments, cerates and plasters, tablet triturations, globules and pellets of medicated cane sugar, antiseptic solutions, etc. The cerate is the most popular form of external medication; these are made by adding 1 part of the mother tincture of the drug to 9 parts of cerate and heating at a low temperature until the menstruum has been evaporated, then final thorough incorporation of the drug extract. Plasters are similar to those used by allopathic physicians, except that they are made in definite strength according to the usual decimal system. Lead plaster and rubber plaster are chiefly used as bases. Nowadays the homœopathic physician makes use of many drugs not mentioned in the homœopathic pharmacopœia, such as ether and chloroform for surgical anesthesia, ethyl chloride for local anesthesia, etc., etc. Indeed it seems that the two schools are coming into closer agreement every year as to the materia medica used to combat disease, the chief difference being their preparation and methods of administration.

Nomenclature—Weights and Measures.—The nomenclature of the homœopathic pharmacopœia, is different from that of the U. S. Pharmacopœia in many respects. Plant drugs are given the botanical title in Latin, with sub-headings giving the natural order, part used, common name and usually the name in French, German and Italian or Spanish. The plant is fully described, its habitat given, its history and the date and author of its "proving" as suitable for use as a homœopathic remedy. Mineral drugs are described, tests are given as to identity and purity and their physical properties are briefly noted. No directions are given as to the manufacture of any chemical salt or for preparation of the elements employed in a pure form. It is in the nomenclature of metallic salts that the greatest difference between the H. P. and the U. S. P. is noted, the H. P. following closely the old German nomenclature in Latin terms. For example, copper sulphate is *Cuprum Sulphuricum*, copper carbonate is *Cuprum Carbonicum*, calcium chloride is *Calcarea Muriatica*, calcium oxalate is *Calcarea Oxalica*, ferric chloride is *Fer-rum Muriaticum*, mercury nitrate is *Mercurius Nitricus* and calomel is *Mercurius Dulcis*. This system of nomenclature seems unsystematic to us, as there are several different terminations used for metals, as shown above, there is no use of the genitive in the Latin titles, all being in the nominative. The nomenclature does not distinguish by termination or formation between alkaloids, glucosides or

other organic salts. Morphine is *Morphinum*, santonin is *Santoninum*, naphthalin is *Naphthalinum*, etc. Acids all have the same termination, as *Acidum Aceticum*, *Acidum Muriaticum*, *Acid Phosphoricum*, etc. Most of the metals and metallic salts are given the usual chemical names but the old Germanicized titles as *Kalium*, *Natrum*, *Calcareum*, etc., are used for potassium, sodium and calcium, *Plumbum* for lead, etc. The definitive has always the same declension terminative as the subject, as *Calcareum Bromatum*, *Ferrum Iodidum*, *Mercurius Nitricus*, etc. Few alkaloidal salts are mentioned, preference being given to the plant itself.

As the homœopathic system of dilutions is based on the decimal system, naturally the metric system of weights and measures was adopted in the later revisions of its pharmacopœias and text books. Formerly the old style apothecary's system of weights and measures was used, most of Hahnemann's original works and those immediately following, using it in connection with the centesimal system of dilution. For instance it was directed that a 1 C. dilution of a mother tincture be made by adding 1 drop of tincture to 99 drops of menstruum, triturations were to be made similarly with milk sugar. The adoption of decimal dilutions as the standard, makes it easy in fact to use any system of weights and measures. Numerous tables are given in the Homœopathic Pharmacopœia for converting weights and measures from one system to another, also tables of alcoholic strength, specific gravities, etc., etc.

There is still some confusion as to dilutions and attenuations, because of the two systems of dilution used, the old style, that of Hahnemann, being centesimal dilution and the modern style introduced by Dr. Constantine Hering, of Philadelphia, being decimal dilution. In the centesimal system one part of the mother tincture or first trituration is diluted with ninety-nine parts of alcohol or sugar of milk, to form the first dilution (1 C.), the second dilution (2 C.) is made by adding 1 part of the first dilution to 99 parts of the menstruum, and so on. The highest dilution commonly used under this system is 3 C., which represents 1 part of drug in 1,000,000. It was early seen that the jump from one to a hundred was too great, both as lacking a dilution of intermediate potency and because of inaccuracy due to manipulation. The decimal system of dilution was therefore generally adopted and is now the one official in the homœopathic pharmacopœia and in prescription writing. This system is distinguished by the letter x prefixed by a number denoting the dilution, thus 1 X means a tincture or trituration containing 1 part of drug in 10 parts of menstruum called the mother tincture or first trituration, 2 X, 1 part in 100, 3 X, 1 part in 1000 and so on. These preparations are made by taking 1 part of the higher dilution, as 2 X, and attenuating it by addition of 9 parts of menstruum, so that each succeeding dilution is one tenth the strength of the preceding one in the scale. Dilutions and attenuations are invariably progressive, that is each succeeding dilution must be made from the next preceding dilution. For example a 3 X dilution must not be made by mixing 1 part of drug with 999 parts of menstruum, it must be made progressively, first the 1 X, or mother tincture, is taken and diluted to 2 X, 1 part in 100, and then 1 part of the 2 X is taken and diluted to 3 X, 1 part in 1000. The object of this successive dilution is to insure the greatest possible sub-division of

the drug, triturations made by this method, especially, showing very minute division. 6 X, 1 part of drug in 1,000,000 parts, is the highest in the decimal scale; it corresponds with the 3 C dilution of the Hahnemann scale. Hahnemann at first used even higher dilutions but such dilutions are seldom used and only for very potent drugs, 2 X and 3 X being the dilutions usually prescribed. The medicated sugar globules of the homœopathic physicians are made of the desired dilution by saturating them with a tincture of the desired strength and carefully drying them. These globules are made of standard weights so that a definite amount of tincture or dilution will be absorbed. Tablet triturations are made directly from the attenuated triturations. Of late years certain combinations of drugs in tablet or triturate form have become popular with physicians and patients of the homœopathic school, although not in strict accord with its teachings. Most of these are simple cathartics, laxatives and tonics and are made from homœopathic tinctures or triturations. (Hypodermic tablets are also used.) The use of the Eclectic concentrated plant principles, such as hydrastin, irisin, podophyllin, etc., is also becoming popular with many physicians as they are highly concentrated plant extracts and well adapted to dilution by trituration. Pills, such as we are accustomed to, are seldom or never employed by the strict homœopathist, although some of the younger men occasionally use them.

In concluding this very incomplete reference to homœopathic pharmacy, there is one of its cardinal doctrines that I would like to emphasize as an admirable one for every pharmacist to adopt, that is the doctrine of absolute cleanliness. The basis of homœopathy being the administration of a single drug in as pure a state as possible, great emphasis is given to the importance of cleanliness of utensils, apparatus and materials. Hahnemann, indeed, laid down the rule, that a separate mortar and pestle be provided for each drug and used for that drug only, the same as to percolators, dilution flasks, etc. As it is practically impossible to provide separate apparatus for all the drugs now official, because of expense and inconvenience, it is customary to have a set of apparatus for a group of drugs that resemble each other in general therapeutic properties, even this, requiring an equipment that would daze the average druggist. Great stress is laid on the cleaning of mortars and pestles and general directions are given for their care, use and cleaning. It is easily seen that the slightest adherence of one drug to the sides of a mortar, would affect the properties of a very dilute attenuation of another drug. The mortars and pestles are further directed to be made of the hardest and most impervious ware, glass apparatus and containers to be made of hard glass containing the minimum of water-soluble constituents. All drugs, fresh or dried, are ordered to be kept in air-tight, dust-proof containers, separated by a small space to prevent accidental contamination, and stored in a cool, dark place. Vegetable drugs must be frequently renewed. Macerating-jars, much used for making mother tinctures, are ordered to be made of hard glass or glazed porcelain. Tincture-presses, etc., must be lined with pure block-tin, if of metal, glazed earthenware is recommended for many drugs. Special attention is given to corks, it being recognized that their porosity is a serious disadvantage, so new corks, thoroughly cleansed by boiling in distilled water, are directed to be used for every container or in preparing dilutions.

If simplicity in medication is the gospel of homœopathy, cleanliness in all things

may be called its commandments. It is indeed a pleasing sight that greets one when visiting the laboratory of the homœopathic pharmacist, it is so clean and orderly. Comparisons are odious, so I will not compare it with the average drug store apology, for laboratory and apparatus, either as to completeness of outfit or general order and cleanliness. There are very few homœopathic pharmacists, however, outside the large cities and hospitals, the bulk of the medicines used, either being prepared by the physician himself, or are manufactured on a large scale by firms making a specialty of homœopathic materia medica. As with us the large manufacturer has come to stay and the majority of physicians purchase their supplies from one firm or another. Probably this is for the best as it makes possible the manufacture and standardization of drugs of high quality, at less cost and labor, than could be done by the individual pharmacist himself. There are many more interesting topics that I might add to this paper, but I have tried to include those of general interest, and hope that I have succeeded in giving a fair idea of homœopathic pharmacy to my associates of the other school. I might add that I hope some member will contribute a historical paper of similar nature to this on eclectic pharmacy at our next annual meeting.

CAMPHOR PRODUCTION IN INDIA.

The Indian Trade Journal states that the camphor tree (*Cinnamomum camphora*), so well known in Japan, Formosa, and China, has been successfully planted in Burma, Ceylon, and the Federated Malay States.

In Burma there are plantations in the upper Chindwin, Myitkyina, Bhamo, and southern Shan States. In the Peninsula of India there are experimental plantations in the Nilgiri Hills and in certain isolated patches of Bombay and Madras. In Ceylon, which lies south of the latitude of its habitat, the tree grows only in the more elevated parts; there is a plantation at Hakgala. Great difficulty has always been experienced in getting good seed imported direct from Japan, and there is often wholesale failure to germinate. Seeds can be obtained from the Yokohama Nursery Co., but the seeds sown for the Burma plantations were obtained from Hongkong. In Ceylon it has been found economical to grow the trees in hedges about 6 to 9 feet high, running in the direction of the prevailing winds. As soon as the plants have reached a fair size and formed woody stems they can be clipped—in three years' time in suitable situations. The simplest method is to use hedge shears. Only the leaves and twigs are required, as the use of the wood and roots only leads to wanton destruction of the plants.—Consul Henry D. Baker, Bombay.

DREAMING AND DOING.

JOSEPH W. ENGLAND, PH. G.

Professor Charles H. Rogers, Dean of the Department of Pharmacy of the West Virginia University, of Morgantown, W. Va., has very kindly asked me to send you a word of greeting to be read at the organization-meeting of your branch on November 19th inst., and I do so with pleasure.

I have no special message "to send to Garcia"—only a few cursory thoughts—but I do want to congratulate you upon the splendid forward step you are taking in forming your branch, and I do want to wish you God-speed in your future work. You are building wiser than you know!

The older I grow the prouder I become of my membership in the American Pharmaceutical Association, because this organization stands for the highest ideals of American Pharmacy, and because membership in it is a privilege and an inspiration.

Its objects are to advance the science and art of pharmacy and to improve the conditions of pharmaceutical practice—by stimulating original research work, by diffusing scientific knowledge, by fostering sound education, by promoting rational and well-balanced legislation—and we badly need it, both national and state—by teaching the history of Pharmacy and tilling the soil for the making of future history, and in a hundred different ways striving to better American Pharmacy and help American pharmacists.

The American Pharmaceutical Association represents, in its membership, not only the rank and file of pharmacists, but also, the captains of industry, the teachers of pharmacy, chemistry, botany, materia medica and related subjects, the editors, publishers and writers of pharmaceutical literature, the food and drug officials, the chemists, biologists and bacteriologists. The comprehensive character of the American Pharmaceutical Association is shown by the fact that, at the recent annual meeting, one hundred different organizations in pharmacy and related interests were represented by delegates to the House of Delegates of the Association.

The American Pharmaceutical Association was born in 1852 of a dream or ideal, but a dream backed by action. Sixty-two years ago, there were no legal standards for the identity, purity and strength of drugs, adulteration, substitution and misbranding were exceedingly common, the examinations of imported drugs at ports of entry were most superficial—in fact the first Federal Drug and Medicines Act to control the quality of imported drugs had been enacted but

Address to the members of the West Virginia Branch of the American Pharmaceutical Association, November 19, 1914.

four years before—and such a thing as the regulation of the use of habit-forming drugs was not thought of.

But a few far-sighted men in American Pharmacy dreamed dreams—had visions of what American Pharmacy should be and should stand for, and they founded the American Pharmaceutical Association, decided on the principles of action that should govern their professional and business conduct, and then they toiled and toiled and toiled in the upbuilding of the structure of their organization, and their *work*, and that of their successors, led by those master-minds of American Pharmacy—Procter, Parrish, Maisch, Squibb, Prescott, Curtman, Ebert, Hallberg, Oldberg, Searby, and many others—some of the old “war horses” are still with us, and long may they live—made for the wonderful progress in the science and art of pharmacy that has taken place during the past sixty-two years. The history of the work of the American Pharmaceutical Association, as exemplified by its publications, is the history of American Pharmacy! These fathers of our calling have left us a priceless heritage of deeds well done, which we will do well to emulate. They dreamed dreams, but they actualized their dreams into deeds; and it is up to us to carry on the work of dreaming and doing so well begun.

In an address at Freemason’s Hall, London, over half a century ago, Charles Dickens said:—

“The most delightful paper, the most charming essay, which the tender imagination of Charles Lamb conceived, represents him as sitting by his fireside on a winter night telling stories to his own dear children, and delighting in their society, until he suddenly comes to his old, solitary bachelor self, and finds that they were but *dream-children*, who might have been, but never were. ‘We are nothing,’ they say to him, ‘less than nothing, and dreams. We are only what might have been, and we must wait on the tedious shore of Lethe, millions of years, before we have existence and a name.’ And immediately awakening, he says, ‘I found myself in my armchair.’ The dream-children whom I would not raise, if I could, before every one of you, according to your various circumstance, should be the dear child you love, the dearer child you have lost, the child you might have had, the child you certainly have been.”

And so it is with the dream-children of our brains in our work for Pharmacy. We dream, we idealize, perchance we act, and the act brings forth fruit, but how often, oh! how often, we lack decision, we fail to act when dream-opportunity knocks at our door—and our dream children die. For to dream only is to die, so far as results are concerned, but to dream and to do, is to live and grow and develop all the latent possibilities within us.

We love Pharmacy and our daily work. We see every now and then something that could be improved, changes that would be helpful and make for genuine progress. We know that if the children of *our* brains were developed, they would grow into lusty fledglings and then into sturdy manhood and would do a whole world of good. But we falter. We hesitate. We demur about training our dream-children. It means work. It means new duties and responsibilities. We don’t want to wear the yoke of service. We know it means self-sacrifice. And so we remain mute, inglorious and lazy. We “job along” in

the same old way, in the direction of least resistance or rather in the direction of least endeavor, and we let "George do it." And George does it and he don't do it right. We *know* he don't. His work is all full of flaws. We see a dozen different places where we could have done it—oh! so much better and more effectively. But we didn't and we don't. We fear to plunge into the seething maelstrom of work and self-sacrifice. We are afraid that we may be criticized. We are afraid that we may not be appreciated. *We are afraid to do a man's work for the sake of men and not for the sake of self!* And so we drift, and drift, and drift, just like Charles Lamb did in his dreams, until we awaken from our dreams to find that the shadows of life are deepening and the evening of eternity is drawing near, and then we realize how little we have done despite the insistent calls of our dream-children, during the years that have passed and gone; how little we are doing for ourselves and our fellowmen!

Just a word more and my preachment will be done. Be strong and loyal members of the grand old American Pharmaceutical Association. Do all in your power to advance the objects it stands for. Develop yourself and your latent possibilities. There is more in you than you give yourselves credit for. Don't be afraid of work for the benefit of the other fellow. It will benefit you in the end, as much so or more, than it will him. Dream, dream, dream all you can of what you can do to help yourself and your fellow pharmacists, but be sure—very sure—that your dreams are not idle figments of the imagination, but real pictures, beautiful pictures, *and* that they are backed by action! action! action!

Paraphrasing Froude, it can be said that "the dreams that men use are the only real dreams, the only ones that have life and growth and convert themselves in practical power. All the rest hang like dust about the brain or dry like rain-drops off the stones."

COLLEGE EXAMINATIONS—A DEFENSE.

PROF. ZADA M. COOPER.

Examinations have been called a "useless antiquity" but, however antiquated they may be, there seems to be no modern substitute that at all accomplishes the desired result. However, among the arguments presented are some that are not without merit and deserve some consideration in any discussion of the question.

It is said that, if they are given to compel review, they are quite unnecessary, that it is possible to review without the test at the end. In theory, that may be true but it has little basis in fact. Experience has shown that such review will be half-hearted with some students. Other individuals will not even do their regular work consistently, to say nothing of review work, unless the fear or dread of an examination hangs over them. Nothing less will induce them to work. There is a possibility here, which has probably been tried more or less successfully by every teacher. It is to set a certain standard, the attainment of which, will excuse from the examination; requiring students to do the review work, not knowing that they shall not be obliged to take the examination, until

the hour for the examination arrives. The method offers considerable inducement, putting a premium on effort and, though it cannot be applied in all cases, for some courses, it brings excellent results.

We are told that examinations do not, as is claimed for them, teach self-control, and we must admit the truth of that statement in some isolated cases. The unreasoning dread of the test, may cause nervous excitable individuals to lose the little hold that they have upon themselves, and consequently come far short of doing their best. It is impossible to get any statistics bearing upon this point, but observation of many classes, leads to the conclusion that it more often cultivates self-control than lack of it. Though not an unmixed good, the good outweighs the bad.

We shall have to grant that drill in expressing themselves well in a limited time, could be better accomplished in some other way, that is, we must grant it, as an abstract fact, but, is it true in a College of Pharmacy? But for written examinations, would they have any such practice at all? English composition can find no place in the *curriculum* of a College of Pharmacy. However much we may theorize about the advantage to be derived from instruction of that sort, and the necessity for every pharmacist to know how to express himself well, we know no such work can have a place on the schedule. Nor is it the duty of any instructor in a College of Pharmacy to teach the use of the English language, but if examinations were to be eliminated entirely, actual practice would be reduced to a minimum. They give exercise to faculties otherwise somewhat dormant during college years. "Theoretically, when the undergraduate has assembled his thoughts, he is ready and competent to write them, but, practically, he is neither entirely ready nor usually entirely competent." It is not enough to think well, we all need practice in expressing our thoughts. Good authorities believe that an individual "must be able to say what he knows and *write* what he knows or he does not know it." Consider again written examinations. A man will learn, to some extent at least, to say what he knows, in clean clear-cut sentences, without superfluous language. This will be true especially, if the instructor urges the necessity of writing briefly but to the point, leaving nothing to be taken for granted and if he gives little credit for rambling, meaningless generalizations, in lieu of real knowledge of the subject. "The student must express his intellectual gains even as he absorbs them, or the crystallization of knowledge into personal thought will be checked in the beginning."

Probably the objection to examinations which is really of greatest force, is, that it is a poor way to determine what a student knows; that his actual standing is better determined in some other way. It is quite probable that if this were the only reason for giving examinations, there would be almost none. Few teachers make an examination, the only test of a man's knowledge of the subject; there are so many factors to be considered. If there were no other way to decide that question than an instructor's personal estimate, decided from daily work, the judgment of any conscientious teacher would come nearer the truth, but estimating a student's knowledge is a minor point, when considering the advisability of giving examinations.

Another objection that cannot be ignored, is that examinations give rise to a wrong spirit. We find in every class a small number who work for marks alone,

forgetting that mastery of the subject should be their aim. Not only is the real purpose forgotten, but all pleasure in the actual work is destroyed. Examinations are responsible for "cramming" in its worst form, a practice which may give some temporary knowledge but no power. Then, too, they give opportunity for cheating, a despicable habit which demoralizes the individual who resorts to it and the sight of which dishonesty, breeds disgust and contempt and discouragement in the hearts of honest individuals. An instructor may overcome, to some extent these bad effects, by emphasizing the fact that marks do not depend alone upon examinations and by bringing swift punishment upon the offender, when detected.

In this twentieth century, more and more emphasis is laid upon deeds. Men and women are judged by deeds; their efficiency by what they can do in their own particular line. Nowhere, perhaps, is this more true than in Pharmacy. A druggist judges his clerk by his ability to fill prescriptions, to sell goods, to get on with people. Are we not all saying, "What can he do? Can he deliver the goods?" Even in college, we put much stress on laboratory work and upon actual dispensing ability; we give courses in salesmanship; we are constantly teaching students to *do*; emphasizing the ability to *do* and telling them that their success, their very bread and butter depends on what they can *do*. This is all quite proper. Not for a moment, should we belittle this side of the question. On the other hand, are we not getting a one-sided estimate, when we judge men and women *only* by what they can do? Judging only by deeds, is not enough, because there are instances in life where that sort of test cannot be made or where it is inadequate. Take, for instance, the student fresh from college. He may not be able to do everything required of him and yet be potentially powerful. It may be in him to do the very best things, but some other test is needed. Among other elements of judgment what he says verbally, or in writing, must be considered. During his college career, recitations help to train him to speak, as does work in a literary society; examinations play their part in the training to write.

It is only too true that the tongue is used to deceive, and that language is perverted to create all sorts of false impressions, but, still, language is an important medium of expression and an "index of character and ideals." To a certain extent, the use of good language is a matter of gift, but it is also a talent that admits of cultivation. Every man whether gifted or not, ought to be able to talk and write intelligently about his own work. The idea is not that men are expected to produce literature, but that they should be able to tell what they know, to put in concrete form their own ideas, so that others can understand them. Some one has said that "speech and writing, if you get them in fair samples, indicate the extent and the value of a college education better than a degree." The way an individual talks and writes, is, in some measure, an indication of his learning and general fitness, as well as his native capacity.

Graduates, probably, often leave college with a sense of relief in the thought that examinations are over, but they are mistaken. They are only leaving behind one sort, to encounter another sort. In school, examination-questions have asked what they know. Life asks, not only what we know but what we can do

and what we are. "Life accepts no excuses," and this examination never ends but is renewed each day. The student does not always realize that scholarship is not an end in itself, but a means to an end, and that end, is life in its broadest sense, ability for service in his chosen calling and ability to enjoy every minute of that service. If our lives measure up to such standards we are passing life's examinations, perhaps, not as well as we wish we might, for our ideals are always above and beyond our realization, but creditably, nevertheless.

REVIEW OF CURRENT PHARMACEUTICAL LITERATURE.

FRANKLIN M. APPLE, PHAR. D.

PHARMACEUTICAL ERA.

An explanation of the Narcotic Law of New York City is made by Commissioner Goldwater, on pp. 459 and 460.

"*A Colorless Ointment of Iodid of Potassium*" (p. 463) is an interesting and valuable article.

"*The origin and practices of old-time Pharmacy*" are the subject of an interesting paper by Mrs. H. Ray Kenaston, on pp. 614 *et seq.*

"*The Manufacture of Biological Products*," on pp. 453 and 454 is the title of an article, to be continued, by Dr. F. E. Stewart.

"*A Corrosive Sublimate Antidote*," on pp. 455 and 456, demonstrates the workings of a close-reasoning, ingenious mind and should lead to practical results.

"*Colloidal Sulphur*" is described on p. 463.

"*Glycerine, as a Sterilizing Bath*," is on p. 464.

"*Proprietaries in Great Britain*," (p. 457) is an interesting and timely article and contains the conclusions and recommendations of a Committee which considered the subject of these preparations.

DRUGGISTS CIRCULAR.

"*The Validity of Druggists Trade-Marks*," (pp. 605 *et seq.*) discusses a "live topic."

"*Making Finger Prints Visible*," (p. 619) is an interesting article on the subject of identifying criminals.

"*Camphor and its Preparations*," are entertainingly treated by Prof. Leon Lascoff, (pp. 613-614.)

A formula for a Liquid Disinfectant for the disinfection of rooms, is given on p. 622, and the use of Coumarin and Balsam Peru is suggested on p. 623, to cover the odor of tar.

"*Petroleum Confections*," are the subject of a paper on p. 629.

"*Digitalis and its Pharmacology*," a paper by Dr. R. A. Hatcher, concludes in this issue, (pp. 607-610.)

Salicyl-Chlorid is suggested as a possible substitute for Aspirin. (p. 618.)

The use of *Lactic Acid Ferments* as remedial agents, is discussed on p. 620.

A method for testing *Papain* is given on p. 620.

A note on the "*Detection of Lead in Bismuth*," appears on p. 621.

"*Honesty in Advertising*," is commented upon, on p. 629.

A good window-display is described under the title "*A Clever Corn Window*," on p. 645.

"*A New Medical Game*," describes the despicable methods of a Brooklyn Physician in building his practise, which methods were seriously detrimental to the pharmacists of his locality, (p. 628).

The dangers besetting the careless use of *Sulfonal*, are set forth on p. 621.

The possibility of poisoning by *Pineapples*, (p. 621).

"*Blindness following the use of Atoxyl*," (p. 621) is interesting, as this drug has not been generally suspected of any such unfavorable effects.

An able summary of the labors of the National Association of Boards of Pharmacopœia appears on p. 602.

Material of much interest to graduates of the P. C. P. is printed on pp. 509-601, which appeals for careful reading and deep thought.

PRACTICAL DRUGGIST.

"The Chemistry of the Radio-Elements," by Harry F. Keller, (pp. 452-453) is informative and timely.

"How to Treat the Man on the Other Side of the Counter," by E. St. Elmo Lewis, on p. 452, is worthy of careful perusal.

The Sale of Insecticides and Fungicides by Druggists, (pp. 434 *et seq.*) points out the trade-value of intimate knowledge of these substances.

THE APOTHECARY.

"Starting in Business and Making Good," by W. S. Denton, on p. 26, contains most admirable advice.

OUR NEW OFFICERS.

WILLIAM CHARLES ALPERS, Sc. D.

THE PRESIDENT ELECT.

William Charles Alpers, Sc. D., the President-elect of the Association, was born at Hanover, Germany, July 7th, 1851. He attended the High School (Gymnasium) in Hanover, then the School of Technology, and later the University of Gottingen where he took courses in Natural Sciences and Mathematics. His studies were interrupted in 1870 by the Franco-German War, in which he took part. After the war, he came to America and was engaged in teaching for nearly ten years in the St. Matthew's Academy, New York. He entered the New York College of Pharmacy and later took a post-graduate course in chemistry at the University of New York, receiving the degree of Sc. D. in Chemistry. In 1881, he opened a pharmacy in Bayonne, N. J., where he remained until 1898.

After leaving Bayonne, N. J., Dr. Alpers was, for a number of years, manager of The Merck Pharmacy, New York, and afterwards conducted The Alpers Pharmacy on Broadway and 31st Streets. He withdrew from active business in 1905.

He became a member of the New Jersey State Pharmaceutical Society, and was elected its President in 1896. He was a member of the State Board of Pharmacy from 1893 to 1898. In 1890 he was elected a member of the American Pharmaceutical Association, and was Chairman of the Scientific Section in 1896, Chairman of Section on Pharmacy and Dispensing in 1906, and Chairman of the Historical Section in 1913. In 1903 was elected First Vice-President.

He is a member of the Executive Committee of the Revision of the Pharmacopœia and is Chairman of the Sub-Committee on Syrups and Elixirs. Was trustee of the New York College of Pharmacy for three terms until his removal to Cleveland.

He has contributed for many years to Pharmaceutical and Chemical literature and is now editor of the *Apotheker-Zeitung*, New York. He is the author of many pamphlets and of two books, *"The Medicinal Plants of Staten Island,"* and *"The Pharmacists at Work."* (Lippincott, 1896.)

Among Dr. Alpers most notable contributions to pharmaceutical literature is

CHAS. H. LAWALL
1st V. P. Elect

LINWOOD A. BROWN
3d V. P. Elect

F. A. RUDDIMANN
2d V. P. Elect

DR. W. C. ALPERS
President-elect

H. V. ARNY
Council

F. M. APPLE
Council

CASWELL A. MAYO
Council

THE OFFICERS ELECTED AT THE RECENT ELECTION OF THE ASSOCIATION.

his History of the American Pharmaceutical Association, the first decade of which was published in the Journal of 1912, and of which the first portion of the second decade appears in this issue.

He was appointed Professor of Pharmacy and Dean of The Cleveland School of Pharmacy in 1914.

Dr. Alpers has been married twice, first to Miss Bertha Guden, by whom he had six children. His oldest son, William H., is a pharmacist in Los Angeles, Cal., and his youngest son, Otto, is a pharmacist in City Island, N. Y. Both attended the New York College of Pharmacy. In 1913 Dr. Alpers espoused the present Madam Alpers, *nee* Miss Mathilda VanDamm.

CHARLES H. LAWALL, PH. M.

Professor Lawall was born in Allentown, Pa., in 1871, his father being a druggist of that city. He was educated in the public schools, and in the State Normal School of Bloomsburg, Penn., to which city his family had removed when Charles was five years old. At the age of seventeen he entered the employ of Moyer Brothers, of Bloomsburg, with whom he remained for a period of about four years, leaving them to go to Philadelphia, to enter the College of Pharmacy of that city. He graduated from that institution in 1893, and in 1901 he was appointed Instructor in the Theory and Practice of Pharmacy in his Alma Mater, and Associate Professor of the same department in 1905. From 1891 to 1904 he was in the employ of Smith Kline and French Co., being engaged principally in their manufacturing and analytical departments. In 1903 he became associated with Dr. Henry Leffmann, a prominent chemist of Philadelphia, and, a few years later, he succeeded to the business, which he has conducted ever since. In August, 1904, he was appointed Chemist to the Dairy and Food Department of Pennsylvania and for several years he was Food Inspection Chemist for the National Government at the Port of Philadelphia. In 1909, he was appointed Lecturer in Applied Organic Chemistry in the Wagner Free Institute of Science.

At the Pharmacopœial Convention of 1910 he was elected a member of the Revision Committee and is Chairman of the sub-committee on Inorganic Chemicals.

He is a voluminous contributor to pharmaceutical literature and has published one book on Chemistry, in connection with Dr. Leffmann.

He was married in 1907 and his spouse, who was educated as a pharmacist, acts as his secretary in his work.

His summer-home is at Longport, N. J., where he enjoys fishing and manual labor, in which he finds rest from his mental pursuits.

EDSEL ALEXANDER RUDDIMAN, M. D., PH. M.

Professor Ruddiman was born at Dearborn, Michigan, December 27, 1864. He is a graduate of the Detroit High School, and received the degree of Pharmaceutical Chemist from the University of Michigan, and that of Ph. M. in 1887 from that institution. He graduated from the Vanderbilt University of Nashville, Tennessee, in 1893, with the degree of M. D.

He was appointed chemist of the Tennessee Board of Pharmacy in 1897 and Food and Drug Chemist of the state in 1907. He is Professor of Pharmacy and Materia Medica in Vanderbilt University. He is the author of "Incompatibilities in Prescriptions," "Whys in Pharmacy," and also of a "Manual of Materia Medica."

He married Miss Jennie Evelyn Perry, of Detroit, Michigan.

LINWOOD A. BROWN, PH. C.

Professor Brown was born September 21, 1881, in Hancock County, Kentucky, and received his early education in the public schools of Lewisport of that state. In 1897 he began the study of Pharmacy, having for his preceptor Mr. G. Orville Patterson, of Hawesville, Ky. He graduated from the Louisville College of Pharmacy in 1903, being honor-man and valedictorian of the Junior Class and he received the gold medal for highest general average for both junior and senior years. He received the degree of Ph. C. from the University of Michigan in 1904 and was appointed assistant to Dr. E. D.

Campbell, in the course of Quantitative Analysis, where he remained one year, specializing in analytical work. He was employed for a time with the Canadian Copper Co. at Copper Cliff, Canada, leaving there to enter the employ of Merck & Co. as analytical chemist. In 1906 he became Assistant Professor of Pharmacy in the North Dakota Agricultural College and was Drug Analyst of the State. He became Professor of Pharmacy in the college in 1908. In 1909 he was appointed Drug Chemist of the Agricultural Experiment Station of the State University of Kentucky, which position he now occupies. Professor Brown is a member of the following societies:

American Association for the Advancement of Science.

American Pharmaceutical Association, of which he is the Second Vice-Chairman of the Scientific Section.

American Chemical Society, being Vice-Chairman of its Pharmaceutical Section.

Kentucky Pharmaceutical Association.

He is also a Royal Arch Mason.

In June 1907 he espoused Miss Vera Johnstone, of Owosso, Michigan.

HARRY V. ARNY, PH. D.

Prof. Arny was born in Philadelphia, Pa., in 1868 and began his study of Pharmacy in New Orleans under the instruction of our esteemed fellow-member Fabius C. Godbold. He entered the Philadelphia College of Pharmacy in 1887 and graduated therefrom in 1889. He studied at the University of Berlin and Göttingen from 1892-1896, making the degree of Doctor of Philosophy in the latter year at Göttingen. He was Professor of Pharmacy at the Cleveland School of Pharmacy from 1897, until called to the chair of Chemistry and Physics in the Columbia University, College of Pharmacy. He be-

came editor of the Druggists Circular in January, 1914.

His association activities have been many and various, and at the present time, he is chairman of the New York Branch of the American Pharmaceutical Association and Vice-President of the American Conference of Pharmaceutical Faculties, and a member of the Revision Committee of the National Formulary and the U. S. Pharmacopœia.

FRANKLIN M. APPLE, PH. D.

Dr. Apple was born at Stone Church, Pa., February 14, 1870. The son of a clergyman, he passed his early days in an educational environment and graduated as valedictorian of the Bangor, Pa. High School in 1885. He entered the profession of Pharmacy at Bangor the same year, and after preliminary education, he came to the Philadelphia College of Pharmacy from which he graduated in 1890, receiving honorable mention. He was then appointed assistant to Prof. S. P. Sadtler. He began business on his own account shortly after, and has remained in touch with the retail business until the first day of this month when he retired from the retail drug business. His activities in the different organizations of the drug business have been so many and various that it would be almost impossible to recount them, and in every position he has occupied, he has been of material service to the trade.

His literary contributions on pharmacal matters would fill a book, and it is needless to recall to the minds of the members the great service which he rendered the membership committee by his paper on "Indispensable Insurance for Pharmacists" which brought in many members to our ranks. He was the originator of the coffin-shape for Bi-chloride of Mercury Tablets. He is now a lecturer on Prescription Compounding at the Medico-Chirurgical College of Philadelphia.

CASWELL A. MAYO, PH. G.

A complete life sketch of President Mayo was published in the September issue. before the scientific section were not of tran-

DR. WILLIAM SAUNDERS.

William Saunders, of international fame as a scientist, was born in Devonshire, England, on June 16, 1836, and died at his home in London, Ontario, on September 13, 1914, after an illness of many months. His early educational advantages were meagre, but he succeeded in obtaining a technical training in pharmacy and chemistry and then entered the retail drug business in London, Ontario. His geniality, honesty and untiring industry brought him a fair measure of success. His love of nature led him to the collection of wild plants and insects and he became an ardent botanist and entomologist. Finding many medicinal plants readily obtainable, he began the manufacture of fluid-extracts, which were so efficient that they attracted the general attention of the medical profession and led to the establishment of an extensive and lucrative business, both wholesale and retail. Years later, when he became Director of the Experimental Farms of the Dominion, he transferred the wholesale business to his eldest son, W. E. Saunders, and the retail department to two of his younger sons.

In addition to his business life, Dr. Saunders took an active part in many other lines of work. Besides his scientific work in botany and entomology, he established a farm for fruit growing, and became a zealous member of the Ontario Fruit Growers Association, of which he was a director for many years and President from 1882-1885. He was appointed Professor of *Materia Medica* in the Western University, London, Ontario, in 1882; was Public Analyst for Western Ontario, President of the Ontario College of Pharmacy (1879-1881), and one of its founders, and a Fellow of the American Association for the Advancement of Science. For over half a century, he was a zealous member of the American Pharmaceutical Association, having been First Vice-President in 1873 and President in 1877.

He contributed a number of exceedingly able papers to the annual meetings of the American Pharmaceutical Association upon "Insect Enemies of Drugs," "Germination of Seeds of Medicinal Plants," "Medicinal Plants of Canada," "Pharmacy in Canada," "Cantharides," "Extract of *Cannabis Indica*," "Mexican Honey Ant," "Oil of *Stillingia*," "Rubber from Milk Weed," "Podophyllum Peltatum," "Preparations of Decoctions and Infusions," "Perfumes," "Sachets," and other subjects.

In 1862 he helped to found the Entomological Society of Ontario, of which he was President for the period of 1883-6, and in 1868, with C. J. S. Bethune, he began the publication of the "Canadian Entomologist."

In 1883, Mr. Saunders published his notable book, "Insects Injurious to Fruits," which is justly regarded as a classic by economic entomologists. In 1881, he was appointed by the Governor General of Canada, the Marquis of Lorn, one of the original Fellows of the Royal Society of Canada, and in 1906, was elected its President, the highest position of honor for scientific work in the Dominion of Canada. He contributed largely to the *Transactions of the Royal Society*. It has been said of him, by an American writer, that "By painstaking study and observation, he has risen to the topmost pinnacle of fame as an entomologist, horticulturist and experimental agriculturist."

In 1885, he was commissioned by the Canadian Government to visit various Experimental Stations in the United States and to report upon agricultural and experimental work in America and Europe. In the following year, he was appointed Director of the Experimental Farms of the Dominion of Canada. Here were carried on, under his direction, a great variety of experiments in breeding and feeding live stock, testing soils and water, growing fruit and ornamental trees of all kinds, selecting hardy varieties, improving the size and quality of fruits adapted to the climate of the Western Provinces, bee-keeping, studies in economic entomology, plant pathology and various other matters pertaining to the welfare of the farming community." The *Canadian Entomologist* (and from an admirable sketch of Dr. Saunders in this journal, October, 1914, 333, written by his very dear friend and co-worker, C. J. S. Bethune, is taken most of the data of this article), states that "Especially noteworthy was his work in crossing varieties of grain and producing new and improved kinds. One alone of these, the Marquis Wheat, is believed to have added millions of dollars to the value of the wheat products of the prairie country. All information thus acquired has been freely afforded to the farmers by distributions of seeds, and bulletins and reports on all manners of subject."

The ability and work of Dr. Saunders has been recognized in many ways. In 1896, he was given the honorary degree of L. L. D. from the Queen's University at Kingston, Ont., and in 1904, the same degree from the University of Toronto. In the same year, his work was commended by the British Association, and in the following year, he received the distinction of Companion of the Order of St. Michael and St. George, C. M. G., conferred by His Majesty, the late King Edward; and the Mantua gold medal for distinction in scientific knowledge. He was a Fellow of the Entomological Society of London, of the Linnean Society, of the Chemical Society and of the Royal Microscopical Society, an honorary member of the Pharmaceutical Society of Great Britain, and an active member of a large number of scientific societies in Canada and the United States.

A SYMPOSIUM ON THE PHARMACEUTICAL SYLLABUS.

PURDUE UNIVERSITY,
LAFAYETTE, INDIANA.

It is impossible for a Pharmaceutical Syllabus to exactly fit the needs of any school of pharmacy or to express the views of any one individual pharmacist or pharmaceutical educator and still be broad enough to act as a guide for all. Therefore, there is probably no one but has some adverse criticism to offer.

However, we must not lose sight of the fact that what we may consider detrimental to the book, some one else may consider excellent, and what we may deem should be included, may be considered useless by others. With this in mind, I am well satisfied with the book and feel that the committee has done an excellent piece of work, and I wish to thank them for it.

C. B. JORDAN, PH. C.

NEW YORK.

I read with great interest the criticism which appeared in the November issue of the Journal (which I received only yesterday) in the report of the minutes of the last General Session of the Association.

I do not agree with our friend Mr. Hilton in his statement in criticism of the book. But *I do agree* with Mr. Mason in his statement that:

"No one ever would be satisfied with any Syllabus that was gotten out by any one individual because a Syllabus like a law, is a result of a compromise."

It must be understood that a curriculum, Syllabus or outline of studies must represent the ideal of education required and conditional amount of latitude must be allowed; and that the work of the Syllabus Committee represented the work of some of the best minds in the pharmaceutical profession.

It is assumed that a head of such a department is capable of outlining an ideal course which meets the requirements of the educational and practical side of pharmacy.

It remains of course for its intelligent examiners to carefully differentiate between the essential and less essential, and to formulate the examination accordingly.

J. LEON LASCOFF, PHAR. D.

PHILADELPHIA, PA.

In reply to your communication asking for an expression of my opinion of the Pharmaceutical Syllabus, 2nd Edition, I would say that I believe it to be defective in several important particulars. In the first place it attempts to crowd too much into the space of time allotted to the instruction in the recognized and approved course. This might be thought to be an error on the safe side, but as the book is intended as a guide for both State Board Examiners and Educators the condition will constantly arise when the selective action of the Educator will cause the elimination from the course of sections upon which the Examiner will later ask questions.

In the "Quantitative Chemistry" particularly the overcrowding is especially noticeable. Only a small fraction of the work outlined can possibly be accomplished in the 40 hours of laboratory work and 10 lectures given for general quantitative chemistry, (page 114); and in Drug Assaying the 50 hours, similarly divided (page 116) is ridiculously inadequate.

If the sections, with the work of which I am familiar, are so poorly planned, I think I am fair in assuming that many other sections with whose details I am not sufficiently conversant to enable me to criticize, are equally faulty.

The reference works show evidence of hasty or careless compilation. The reference on page 162 to the National Dispensatory, Stille & Maisch, and the United States Dispensatory, Wood & Bache, raises a question in the mind whether many others of less familiar works referred to are similarly obsolete.

The book will serve a good purpose however as a guide or a stepping stone to a more practical work which will probably come at some later time.

CHARLES H. LAWALL, PH. M.

PHILADELPHIA, PA.

I am sending the following, concerning my views about the Pharmaceutical Syllabus. The book was designed to be a guide to the faculties of pharmaceutical colleges, by outlining the courses of study which it was thought desirable to teach in such institutions, and possibly this was its principal value.

Secondly, to inform members of boards of pharmacy of the nature of such courses, so as to indicate the scope of the questions permissible to be asked in board examinations.

Thirdly, it might give to a prospective student of pharmacy, (if he should ever see it) a bird's eye view of the studies he would be compelled to take up, although it is quite possible that after perusing it, he might come to the conclusion of the preacher in the Book of Ecclesiastics, "much study is a weariness of the flesh." The first edition, which was necessarily the work of a few, was published at the expense of the New York Board of Pharmacy.

It met with considerable criticism, some of it of an unfavorable nature. This edition being exhausted, and there being some demand for the book, it was necessary to prepare a new edition. It was thought that the book would be more representative in character if prepared by a larger committee, one representing the three great pharmaceutical organizations of our country, viz, the American Pharmaceutical Association, the Conference of Pharmaceutical Faculties and the National Association of Boards of Pharmacy.

In pursuance of a request to this effect, a committee consisting of seven representatives from each of these organizations was elected. After the organization of the committee, it was divided into three groups to consider the three main subjects of materia medica, pharmacy and chemistry. In the work of the committee much correspondence ensued which necessarily limited progress, as in a work of this kind there were at times somewhat discordant views. It was not until the Pittsburg meeting of the committee in December, 1912, that the book approached completion. At that time by the close application of some of the members, who worked from 10 A. M. of one day, until 3 A. M. of the next morning much progress was made.

There was considerable divergence of opinion as to the nature, and amount of matter which should be included in the book, those institutions having longer courses of study, pleaded for fuller courses of instruction than was desired by those institutions giving shorter courses, and we were continually reminded that we were preparing a syllabus for a two years course of instruction only.

In some cases a compromise was affected by putting some of the new matter in brackets, thereby indicating that its teaching was a matter of choice. Some of the matter considered by some of us essential, was left out entirely. In the course on Physiology, the Special Senses, (page 38), received so brief mention as hardly to give an intelligent idea of the subject.

The Sub-Committee on Materia Medica decided that the different subjects of that branch should be classified according to their action on the human body, but notwithstanding the vote, it was not done, the former classification being retained.

The general committee also by vote, ordered that the American Pharmaceutical Association be asked to take charge of the publishing and sale of the book, as the majority felt that the facilities of the association for this work, would give it a wider distribution, and greater prominence. Why this explicit command of the general committee was not carried out by the executive committee, I have never been able to learn.

It has been urged that the Syllabus is too technical for members of boards of pharmacy. While this objection may hold good in some cases (as politics at times influences appointments), it by no means holds good in all. A criticism might be made regarding the speed with which the Syllabus was adopted by the different boards of pharmacy. This, while complimentary to the book, hardly implies a careful examination of it, but would lead one to infer that action was contagious. It may be urged against the Syllabus that the different subjects are not taken up in the best manner, some other arrangement would have been better, but it is expressly stated on page 16, "It is not designed, however, to interfere with such flexibility in courses of study and freedom in methods of instruction as ought to exist in pharmacy schools." Special attention is called to Chapter VI, on Reference Works, this I consider a most valuable compendium of the literature pertaining to pharmacy.

Let me say in conclusion that no one of the committee considers the Syllabus a perfect book, but it is undoubtedly a step in the direction of the unification of courses of instruction in colleges of pharmacy.

CLEMENT B. LOWE.

DETROIT, MICHIGAN.

The Pharmaceutical Syllabus has been criticized here and there by some individual because it did not seem to *him* what it ought to be. To me this is in a certain sense a certificate of character. The Syllabus ought not to represent the ideas of *any one man*. When it does that it is vicious: it is lop-sided: it is eccentric: it is unbalanced.

The Syllabus, as it stands to-day, is the result of the wisdom of twenty-one men, who for the most part have worked honestly and earnestly in an effort to get out something that would be a credit and benefit to American pharmacy. But when twenty-one men, or a majority among them, agree on any proposition, it is only as the result of compromise. You see this sort of compromise everywhere. President Wilson may have his idea of what a tariff or a revenue law should be, but when a house of representatives and a senate bring their wisdom to bear on the problem, changes and modifications are inevitable. The final result is not completely satisfactory to any one man—and it ought not to be.

The Syllabus may possibly be open to some valid criticism. For the most part, however, it represents all that is humanly possible at this time. The next edition will be better, and every future edition will register a distinct improvement. Fundamentally the whole Syllabus movement is one of vital importance to American pharmacy. Upon it will largely be based the educational growth, development, and unification of the future.

More than that, the Pharmaceutical Syllabus brings together for the first time examining boards on the one hand and colleges on the other. Through the medium of the Syllabus

these two groups of men are now working together in an earnest effort toward harmony and mutual understanding. This means a great deal in itself, wholly irrespective of what book or books may result as a consequence.

HARRY B. MASON.

BOONVILLE, MO.

The Pharmaceutical Syllabus, is not perfect; nor will it ever be. Criticisms on its contents will be made just as are being made on the pharmacopœia. This is perfectly natural, and it is well that such is the case. Otherwise there would be no improvements made. Progress and improvements come only after criticisms. The strength of the movement is in the fact that the Syllabus is being promulgated by three coördinating bodies, the American Pharmaceutical Association, the American Conference of Pharmaceutical Faculties and the National Association of Boards of Pharmacy, and we should recognize that fact. The American Pharmaceutical Association is represented on the committee by only a certain part, and can therefore control the Syllabus to that extent only. 'Tis true that our beloved association represents the best there is in pharmacy, professionally and morally, and must, therefore, take the lead in every movement that pertains to the betterment of pharmacy. If, however, the Syllabus is to become a standard for all, other bodies must have a right to take part in its development. And that is just the condition at this time. The Syllabus is being promoted by delegate bodies, and in that way becomes a standard for all. I don't believe that a Syllabus, controlled entirely by the American Pharmaceutical Association, can ever obtain a legal recognition. The National Formulary, if it shall continue to hold its legal status, must, in the end, emanate from a different source than it now does. It must be revised by a delegate convention, as is the pharmacopœia. Had President Beringer's suggestion been, that the Council take careful consideration of the revision of *the* Syllabus, instead of *a* Syllabus, no objections would have been raised against his criticism. The Syllabus already exists, and we are only interested in its revision and perfection.

Let us then, encourage the committee having in charge the revision of the Syllabus, and in a proper spirit bring about further improvements in the work; and not destroy what has been done. The Syllabus has been approved and accepted by the pharmacists generally, and several schools and boards are adjusting their work to conform to it. The present revisions of the Pharmacopœia and the National Formulary will not be free of errors; and yet, as loyal Americans, the pharmacists will accept them as their guide. And I believe the Syllabus will be accepted in the same spirit. The American Pharmaceutical Association did well in not overthrowing the work of the old committee, and I believe when another revision is made more harmony and satisfaction will prevail, and the pioneer work of our New York brothers be better understood and appreciated. I, too, find objectionable features in the Syllabus and would eliminate some things and change others, if I alone were interested; but I realize that the field is large, and that others have a right to their views. The mere fact that this movement has brought out a spirited discussion, means that it is of value; otherwise the Syllabus would have died of inanition. My greatest objection to the course outlined in the Syllabus, is the inclusion of the subject of physiology. This subject should be covered by the student while he is attending the common or public school, and his time used in the college of pharmacy, mastering a business course as applied to the practice of pharmacy, as now conducted. Let us therefore accept the work of the Syllabus committee, and encourage and aid it, in perfecting the work, so that in time the desired uniformity in our college courses and board examinations will be realized.

WM. MITTELBACH.

SEATTLE, WASHINGTON.

Regarding an expression on the recently published Pharmaceutical Syllabus will say that it is my opinion that we should use it, and give it a chance. I am inclined to think that much good can be done by carefully following the lines laid down in the Syllabus, and until the time is ripe for further improvement, I would consider it unwise to change it in any way. I believe that the committee in charge of the work has spent much time and has looked into this matter carefully, and I believe it is due the committee to test the present Syllabus as it is published.

C. OSSEWARD.

PHILADELPHIA, PENN.

In reply to your letter of November 2nd asking for my views of the recently published Pharmaceutical Syllabus, I would state that although I cannot agree to many of the things as set forth in the present Syllabus, I am heartily in accord with the objects and *personnel* of the Syllabus Committee. I am of the opinion that if we are ever to have uniform instruction in pharmacy and coöperation between pharmaceutical instructors and state examiners, it can only be accomplished through a medium such as the Syllabus.

I am also of the opinion that a Syllabus prepared independently by any one of the three coördinate bodies now in charge of this work, without the help and suggestions of the other two, would prove a failure and, therefore, feel that the present plan of placing this task in

the hands of a committee, composed of members of the American Pharmaceutical Association, the American Conference of Pharmaceutical Faculties and the National Association of Boards of Pharmacy, cannot be improved upon.

I heartily approve of the system adopted by the Syllabus Committee of classifying all knowledge relating to *Materia Medica*, under the general head "Pharmacology" and have, therefore, in my text-book on "Biochemic Drug Assay Methods" given, *verbatim*, the definitions of the Syllabus for Pharmacology, Pharmacognosy, Pharmacodynamics and Therapynamics. I find, on practical application of this plan, that my students at the Medico-Chirurgical College are better able to coördinate the knowledge of *Materia Medica* than was possible to acquire, under the old system in which the importance of Pharmacodynamics was lost sight of.

PAUL S. PITTENGER.

PHILADELPHIA, PENN.

A National Syllabus which aims to provide an outline of subjects which should be taught in colleges and departments of pharmacy is an actual need. The American Pharmaceutical Association represents the professional and scientific element better than any other pharmaceutical organization in America and is qualified to frame a proper syllabus.

The book which has been prepared is entirely too voluminous and detailed and, in my opinion, cannot be used successfully because too much has been squeezed into it to adequately teach all of its subjects to even very bright students in the time allotted. It would be far better to establish a minimum basis which the colleges, large and small, can conscientiously follow in a two-year course than to try to cover the greatly enlarged field of modern pharmacy in the way demanded by the present Syllabus.

We are advised that the book is not intended to be followed in all of its details; then why send it forth at all? Why not remedy its defects at once and secure universal acceptance?

JOSEPH P. REMINGTON, PH. M.

NASHVILLE, TENNESSEE.

The Pharmaceutical Syllabus is not a perfect guide for the educator or the examiner. There is work outlined in it which may seem to be necessary in one college but not in another. Latin, for example, may be necessary in some colleges which require comparatively little preparatory work, while it may not be necessary in some colleges which require high school graduation. Why, the future pharmacist needs a course in business more than the future grocer or other commercial man, is not entirely clear. The introduction of doses into the Syllabus, does not seem necessary.

And so we might go on and find other points on which we disagree. Nevertheless, the Syllabus should have the support of every pharmacist. It is work in the right direction. The *curricula* of the colleges and the examinations of the boards, are getting more uniform and closer together. No organization of any kind could be better fitted to accomplish this end than representatives from the American Pharmaceutical Association, the National Associations of Boards of Pharmacy, and the American Conference of Pharmaceutical Faculties, and if they fail, there is but little hope for any other body of men to succeed.

Statements made in the preface and in the introductory notes of the Syllabus, make it plain what it is. It is intended to be taken as a guide, not followed literally, and as such I am a strong supporter of it and am convinced that much good to pharmacy will result from it.

EDSEL A. RUDDIMAN.

THE UNIVERSITY OF KANSAS, LAWRENCE.

"The book accomplishes what it aims to do, in giving a concise statement of a scheme of instruction. It furnishes, not only to instructors but to many others seeking such knowledge, a systematic arrangement which is helpful to the instructor. It indicates the general scope and character of instruction which might be given by the teacher and the work to be accomplished by the student and this partakes of a national rather than of a local character which is decidedly advantageous. A conscientious instructor realizes the necessity of getting out of his local environment and getting hold of a broader and more comprehensive view than his environment is apt to give him.

"I understand the work as one that is not designed to interfere with the flexibility of courses of study. Nor does it in any way suggest the possibility of detracting from the value of the personality of the instructor.

"To my mind the work is in advance of the present time in reference to the basis of examination questions for use by boards of pharmacy and possibly many of our teachers. That is to say, boards of pharmacy and instructors alike may justly feel at times that details of the course presented in the Syllabus cannot be met by present conditions, or rather the present conditions do not demand such details. To do the amount of work that is required in the Syllabus without degrading it into a quiz-compend course would require considerable skill on the part of the instructors. This is, however, a material point which every instructor is to work out for himself."

L. E. SAYRE, Dean.

THE STATE UNIVERSITY OF IOWA.

"A famous preacher once remarked that he had found a lot of human nature in this world" and this statement I believe applies to some of the criticism of the Syllabus.

The Syllabus is not perfect. No one expected it to be perfect and some of the criticism is, no doubt, just, especially the typographical errors, which are inexcusable.

The Syllabus, if adopted as a tentative outline of a minimum course of study, will help to unify the courses of instruction in our colleges and if used as a basis of state board examinations will correlate the work of the two.

The future editions of the Syllabus can be improved and criticism, if of a *constructive nature* is to be desired.

The committee representing the American Pharmaceutical Association, The American Conference of Pharmaceutical Faculties and the National Association of Boards of Pharmacy is thoroughly representative of American pharmacy and they should have the coöperation of all in their honest effort in preparing a work which marks one of the great epochs in American Pharmacy.

WILBER J. TEETERS, Dean.

STATE BOARD OF PHARMACY OF INDIANA.

"I have found the old Syllabus a great help in the preparation of Board Questions, and I think the new Syllabus is a great improvement over the first one. No board member should fail to use the Syllabus if he wants to grow and improve in his board work."

WM. H. RUDDER,

DETROIT, MICHIGAN.

"As to the practicability and fitness of the Syllabus there will always be differences of opinion among individuals, and undoubtedly each school teacher or examiner will use such portions as seem to him best and reject the rest. This is the best criterion of its usefulness."

WILBUR L. SCOVILLE, PH. D.

DETROIT, MICH.

"In examining the Pharmaceutical Syllabus which came to me sometime ago, I have been very favorably impressed with the work of the committee which has had this matter in hand. The committee has been very fortunate in the members comprising it as well as in the method of its selection, constituting as it does, the most comprehensive representation of all the various workers in pharmacy.

"While it is impossible in a work of this kind to meet in detail the approval of any one man or body of men (and I presume this includes the committee itself) yet it is this very fact—that of being a compromise—a compromise of ideas of men studying the needs of pharmacy from every angle—that gives it its especial value. In just the degree in which it might fail to be a compromise, or the degree in which it might fail to reflect accurately the composite idea of the committee representing pharmacy as a whole—in just that degree would it fail of its mission.

"The writer believes that a future edition will doubtlessly be an improvement on this one, certain defects may be discovered, some inconsistencies ironed out but that this reflects no discredit on the work of the present committee which work will, he is sure, be of great assistance to members of examining boards from whose view point more especially he considers the work."

LEONARD A. SELTZER, PH. C.

PHILADELPHIA, PENN.

"Responding to your letter desiring information concerning my opinion of the recently issued Pharmaceutical Syllabus, I would say that the classification of the science that treats of drugs and medicines, their nature, preparation, administration and effect, under the general head 'pharmacology' meets my hearty approval. This is of course an old classification and the Syllabus has been criticized for going back to it, but no less authority than Hermann Professor of Physiology in the University of Zurich, and one of the leading authorities in experimental vivisection, in the introduction to his 'Experimental Pharmacology,' a hand book of methods for studying the physiologic action of drugs, said, 'Pharmacology, in its widest scope, embraces the study of drugs from all points of view, and the information thereby acquired may be useful under the most diverse conditions; to the physician, to enable the recognition and proper treatment of cases of poisoning, or to permit of the use of drugs for therapeutic purposes; to the public, to permit the avoidance of noxious substances; to the physiologist and pathologist, to enable the application of information derived from the study of the action of poisons to the advancement of their sciences. The study of pharmacology may therefore be limited according as one or more of these points of view occupy the first place in the mind of the investigator.'

"The definition of 'pharmacology' given by the Pharmaceutical Syllabus includes pharmacognosy, pharmacy, pharmacodynamics and therapy-dynamics. This is in harmony with the definition published in the Standard Dictionary which defines 'pharmacology' as 'the science

of medicines, their nature, preparation, administration and effects; including pharmacy, pharmacodynamics and pharmacognosy.' The definition is likewise in harmony with Webster's Dictionary and with the Century Dictionary.

"The advantage of this classification to pharmacy and the pharmacist becomes at once apparent in the work of classifying the newer vegetable drugs, as anyone can testify who has had experience in doing this work.

"In the next place, this classification associates in proper relationship knowledge of all the branches of materia medica science, and brings out very clearly the fact that pharmacy, as a branch of pharmacology, is the science and art of preparing, preserving, compounding and dispensing medicine, and that it is related to pharmacognosy, which 'treats of the identification and selection of vegetable and animal drugs;' that it is also related to pharmacodynamics, which 'treats of the action of medicines on healthy organs;' and is also related to therapy-dynamics, which 'treats of the action of medicines on diseased organs.'

"All of these branches of pharmacologic science are correlated and mutually dependent. Consequently, no person can become proficient in the knowledge of that science without acquiring an education in the science of the materia medica as a whole. Proper knowledge of the method of applying medicine to the treatment of the sick requires some acquaintance with pharmacognosy, pharmacy, pharmacodynamics and therapy-dynamics, and special knowledge of the action of drugs on healthy and diseased organs. The medical curriculum should therefore embrace the study of pharmacology. To select, prepare, preserve, compound and dispense medicines requires knowledge of pharmacodynamics and therapy-dynamics, as well as knowledge of pharmacognosy and pharmacy. Therefore, the pharmaceutical curriculum should include the study of pharmacology as a whole, with special attention given to the selection, preservation, preparation, compounding and dispensing of drugs.

"Proper education in pharmacologic science on the part of both physician and pharmacist would bring the medical and pharmaceutical professions together in the study of the common science and elevate the practice of pharmacy to a profession in fact as well as in name.

"In a monograph entitled 'An old system and a new science' published in 1882, I advocated a return to the classification in which knowledge relating to the materia medica is embraced under the general head 'pharmacology;' in my address as Chairman of the Section on Materia Medica, Pharmacy and Therapeutics, delivered at the Forty-seventh Annual Meeting (1896) of the American Medical Association, I again suggested a return to this classification. In numerous papers on the subject since contributed to medical and pharmaceutical societies and press, I have repeated the same plea again and again.

"It was therefore gratifying to me when the National Committee representing the boards and schools of pharmacy of the United States adopted this classification. It was also gratifying when the classification was incorporated into the New York State Pharmacy Law, and adopted by the Board of Regents of the State of New York, for the guidance of teachers of pharmacy in that state.

"While I am fully in harmony with the objects and plans of the Syllabus Committee, I am not as fully in harmony with the Syllabus itself. I am aware that the Syllabus as it now stands represents a large amount of work by experts who have had much more experience than has fallen to my lot as an educator, and I therefore hesitate about criticising the Syllabus. In conducting my Chair on Materia Medica in the Department of Pharmacy and Chemistry of the Medico-Chirurgical College, I have associated with me a specialist in pharmacognosy, also a specialist in pharmacodynamics, in so far as the so-called physiologic testing of materia medica products is concerned. We are using the Syllabus as a basis of our work, and modifying the plan to meet conditions pertaining thereto. As I understand the object of the Committee, it is to place in the hands of the teaching faculties a general plan for teaching pharmacologic science, the same to be modified by each institution to meet its own requirements, hoping thereby to promote and facilitate the development of the plan of the Syllabus, and make it practical. The plan of the Syllabus is therefore in the state of evolution, and does not pretend to be completed.

"I am well aware that leading educators in pharmacy are entirely opposed to the plan of the Syllabus Committee. Some of these educators are my seniors and have had far more experience in teaching than I have. In this respect, therefore, they have an advantage over me. On the other hand, I feel that I have an advantage over them in the fact that I am a physician as well as pharmacist, having graduated from the P. C. P., and the Jefferson Medical College, and practiced both professions for some years, although not in conjunction. I have also had the peculiar advantage resulting from a lifetime study of the problems pertaining to the relations which I believe should exist between the medical and pharmaceutical professions. I believe that pharmacy and medicine are branches of the same science and practice; that they are closely related and mutually dependent; that the only justification for the existence of either is the prevention and cure of disease; that the application of drugs for prevention and cure requires a medical education; that the selection, preservation, preparation, compounding and dispensing of medicines requires a pharmaceutical education; that the practice of the physician and pharmacist should each be limited to its own sphere, except at the point where both from necessity overlap, and that in this middle ground of domestic medicine, both should consider the interests of the public as paramount to selfish interest, and

coöperate with each other in protecting the public from the results of ignorance and greed on the part of those who would dishonestly exploit the sick-room for gain.

"To the extent that the adoption of the Syllabus for the teaching of pharmacologic science in both medical and pharmaceutical schools can be made subservient to these objects, I am entirely in harmony with the National Syllabus Committee."

F. E. STEWART, M. D.

PITTSBURG, PENN.

In reply to your request will say that the Pennsylvania Pharmacy Board at a recent meeting approved and adopted the second edition of the Pharmaceutical Syllabus, excepting however, the matter pertaining to physiology and to commercial pharmacy, the latter plays no part in the proper preparation of medicines, and an imperfect knowledge of the former subject, may only serve as a suggestion to counter prescribing.

It appears to be high time that more or less uniform methods are adopted by schools of pharmacy, in instructing their students, and by pharmacy boards, in the examination of those who aim to hold themselves up to the public as being proficient in the art of preparing medicines. The Syllabus may be regarded as a primary step; many steps may be needed before perfection is reached, but after the first step is taken there is encouragement for further progress.

Personally, I take little interest in entrance-requirement methods of teaching *et cet.* My interest centers on the finished product, and I have a private opinion—which may not look quite polite if put in cold type—of the system which turns out as finished pharmacists, students whose conceptions of an element are as follows:

"Anything having a chemical formula, or can exist alone, marble is an element." "Any substance which is found existing naturally in the earth." "One of the constituents of the atmosphere." "Anything which exists and is essential to life." "Any substance which may be obtained from the ground." "An element is what bodies are made of."

The above replies were given by graduates in pharmacy, at the recent board examination, whose college record shows that they were graduated on a record of "sufficient," and they are here given to show that a *perfect* pharmaceutical syllabus will not cure all of our ills.

LOUIS EMANUEL, President.

BUFFALO, N. Y.

Those concerned in the production of this volume have felt that they were engaged in constructive work. The authors of this work have been traveling mostly over an uncharted sea. The Committee itself had many discussions before reaching a substantial agreement upon many questions of detail. Under these circumstances it is not at all singular that earnest workers in the cause of pharmacy outside of the Committee, find things to criticise in the volume.

Sharp differences of opinion have often been found in New York State where the Syllabus idea has been carefully fostered. Yet, after ample discussion unanimous agreement was reached. Thinking the experience of New York State may be of service to all interested in the Syllabus, pro and con, the following records are submitted: As a word of explanation it might be stated that the "Pharmacy Council" in the State of New York consists of the deans of its five colleges of Pharmacy and of the Assistant Commissioner in charge of Higher Education.

EXTRACT FROM THE MINUTES OF THE PHARMACY COUNCIL.

To the Pharmacy Council of the State of New York:

The Syllabus Committee of this state takes pleasure in reporting that after several years' labor the second edition of the *National Pharmaceutical Syllabus* has been completed and published. The new volume follows the general plan of the first edition. The principal change made is in the addition of 100 hours each to the subjects of Pharmacy and Materia Medica, so that a minimum course of 1200 hours is outlined instead of 1000 hours.

Probably no member of the Syllabus Committee of twenty-one, representing the colleges, the boards and practical pharmacists, would claim that the work is perfect. It represents a compromise between many conflicting opinions. The influence of the schools giving courses of two years approximating 1200 hours of instruction tended to reduce the material contained in the volume, while the interests of schools giving three year courses or covering 1800 hours or more, tended to increase the subject matter of the book. It is recognized by all those who have carefully examined this edition that its contents cannot be properly taught in 1200 hours.

This raises the question as to whether an injustice will be done the schools with 1200 hour courses when the Syllabus is adopted by boards of pharmacy as a guide of their examinations. In this state this difficulty is happily avoided by our system of selection questions by which an examiner is permitted to answer ten questions out of a total of fifteen. It is not believed that this theoretical difficulty will prove to be an actual one in any state.

The first edition was prepared for a syllabus period of five years. The second edition, however, has no specific time for operation. It was thought wise by the committee that as the book is more or less experimental it would be better to preserve the opportunity of revising

it if found unsatisfactory in two or three years, or if found acceptable to those interested, to use it for an indefinite period.

The question arises as to what may be involved by its adoption either by schools of pharmacy or by boards of pharmacy. To give light upon this subject a number of quotations from the book itself are given.

Page 8, line 9, "But a syllabus like a living language is necessarily in process of constant change." It must not be used to dam the flow of increasing knowledge either of fact or practice."

Page 16, line 1, "Definition. The Pharmaceutical Syllabus is prepared to indicate the general scope and character of the instruction to be given by the teacher and the work to be done by the student."

Page 16, line 10. "It is not designed, however, to interfere with such flexibility in courses of study and freedom in methods of instruction as ought to exist in pharmacy schools."

Page 17, line 23. "The Syllabus is intended to allow the individual teacher or school the widest possible liberty as to order and grouping of these topics and method of presentation. Its object is to specify what topics are to be taught by the schools and expected by the boards without concerning itself with the manner in which this result is reached by any school, teacher or book."

Page 141, line 1. "The selection of the particular line of experiments to accompany a course of lectures upon pharmaceutical *technique* must necessarily be left largely to the judgment of the instructor, the choice of the latter naturally depending upon his opinion of the portions of the subject which need the emphasis of laboratory work."

Page 146, line 10. "Prepare the following official preparations and such additional U. S. P. or N. F. preparations as the time will permit as far as possible selecting such additional preparations from those which especially require skill and careful manipulation."

Page 149, line 4. "The time allotted for dispensing pharmacy should be arranged to give a liberal number of hours for actual work in the compounding of prescriptions."

With this indication of the purpose and spirit of the work it is not believed that it will be found to be a harness that will gall the user, nor a rigid mould that will prevent initiative or kill enthusiasm in either teacher or examiner. We, therefore, recommend that it be adopted by this Council and recommended to the schools of pharmacy in this state and to our Board of Pharmacy for adoption by each of such organizations.

Respectfully submitted,

(Signed) WILLIS G. GREGORY,
AUGUSTUS S. DOWNING,
HENRY H. RUSBY,
State Syllabus Committee.

A. Voted unanimously that we recommend to the pharmacy schools of the state the adoption of the second edition of the *National Pharmaceutical Syllabus* as a general guide for courses of instruction to take effect July 31st, 1914.

B. Voted unanimously that we recommend to the State Board of Pharmacy the adoption of the second edition of the *National Pharmaceutical Syllabus* as a general guide for examination of candidates for pharmacists' licenses to take effect July 31st, 1916.

At the first meeting of the Board of Pharmacy of the State of New York, following this action by the Pharmacy Council and after considerable discussion of the whole Syllabus proposition the Board voted unanimously to adopt the second edition of the *National Pharmaceutical Syllabus* as a general guide for the examination of candidates for pharmacists' licenses, to take effect July 31st, 1916.

It might be stated in passing that under this action of the Board of Pharmacy was the belief that whatever inconsistencies or defects there might be in the Syllabus they would not be at all commensurate with the evils of an entire lack of standardization in the teaching of the Colleges and the examinations of the Boards.

WILLIS G. GREGORY.

Dr. Alpers, Mesdames Tschirch and Alpers, Dr. Tschirch, at the Tschirch Villa, Berne.

PROF. GUSTAV BACHMAN

Minneapolis.

July 2nd, 1914, our party, of about 130 pharmacists representing nearly every state in the Union, sailed on the S. S. Barbarossa for Europe, under the auspices of the German Apothecaries Society of New York City.

On July 13th we arrived in Bremen.

Our visit in Berlin of only three days will always be remembered with great interest and pleasure. We were here the guests of the German Apothecaries' Society, an organization composed of pharmacists from throughout Germany. It owns a large manufacturing establishment and wholesale house. In connection with the factory, is a colossal club-house in which reception-rooms, banquet-halls and rest-rooms are arranged.

Our party was invited to meet at the Club House soon after arriving in Berlin. After listening to an address of welcome by the president of the association, we were divided into a number of groups for the inspection of the establishment, the several groups being distinguished by different flowers, such as white rose, red rose, carnation, etc. Competent guides were assigned to each group, who explained the points of interest both in German and in English. Contrary to our expectations, we saw few patent medicines and proprietary articles in stock. Most of the floor-space was occupied with large pharmaceutical and analytical laboratories, where we saw official preparations in process of manufacture in large quantities. One room in the factory was used exclusively for filling ampoules with potent liquids. In another spacious laboratory we saw the spreading of plasters on linen by machines, gauze bandages made into long rolls and cut into pieces of different widths. After partaking of a banquet fit for the gods, we visited the Institute of Pharmacy of the University of Berlin. Dr. Thoms, the head of this department, gave us an interesting and instructive lecture which was illustrated with spectacular experiments. The most interesting experiments were made with liquid air. After this we inspected the pharmaceutical laboratories. This Institute was recently built and is therefore well planned, lighted, ventilated and equipped with the latest scientific apparatus. All museum cases containing chemicals that are affected by light, have amber colored glass doors.

Our next visit was to the Botanical Gardens of the "U" of Berlin. The gardens are

under the direction of Dr. Gilg and are the most complete of their kind. Trees, shrubs, flowers and medicinal plants, indigenous to every country in the world, are to be found in the gardens where they grow under conditions similar to those prevailing in their native country. Here we saw the wonderful vegetation of Japan, then suddenly found ourselves in Africa, then in Cuba, etc. When we came to the United States gardens I could imagine myself in Minneapolis. In Berlin our attention was called to the two kinds of stores; namely, the Apotheke meaning a pharmacy and a Drogerie meaning a drug store. Upon inquiry, we learned the differences between these two stores. An Apotheke is a pharmacy which can only be managed by a registered pharmacist who confines his activity to selling drugs and the filling of prescriptions, while a Drogerie or drug store can be managed by anybody. Such a store carries druggists' sundries, patent medicines and sick room supplies. No prescriptions are allowed to be dispensed in a Drogerie. The government designates where an Apotheke is to be located and the number to be established. Only one Pharmacy is allowed in a community of 10,000 people. The prices charged for a prescription are also regulated by law. The price is based on the cost of ingredients, the time required to fill the prescriptions and the cost of the container. Prescriptions are not numbered nor placed on file, but are always returned to the patient. All prescriptions containing liquids are dispensed by weight. No graduates are, as a rule, to be found in the store. Poisons are kept in closets and can be reached only by unlocking three doors. Phosphorus must be kept in the basement, where a specially built-in closet is constructed in the foundation of the building.

Arriving in Vienna we were the guests of the local pharmacist's association. A splendid

BERLIN. COLLEGE OF PHARMACY, UNIVERSITY OF BERLIN.

BERLIN. AMERICANS ENTERING GERMAN APOTHECARIES ASSOCIATION.

program was planned for us. The first day we visited the University, whose organization dates back to the year 1363. It is to-day a model institution, beautiful, spacious and well arranged. A rare opportunity was extended to our party to inspect the Pharmacy Depot of the Military Department. Considering the excitement preceding the declaration of war between Austria and Serbia, we were indeed fortunate to be given the privilege of visiting this department. Here the supplies for the entire Austrian army are made. Our guide was an officer, who was very courteous and willing to explain things in detail. We saw the preparation of gauze bandages, adhesive plasters and absorbent cotton. These packages were pressed into flat pieces in order to reduce their bulk so that they would take up less room in a soldier's knapsack. Every soldier is provided with a case containing supplies for "first aid" to the injured. In Vienna we visited the oldest Apotheke in Austria. It was established in 1551. Here they prepare everything needed in a pharmacy. They employ 30 people who are busy making pills, tablets and other preparations not, as a rule, made by pharmacists in the United States. The proprietor of this store said the physicians of Vienna prescribe many American-made preparations, because of the fact that so many American physicians, who are taking post-graduate work, introduce the proprietary articles.

The next city of special interest to me was Munich. I spent an afternoon in the German Scientific Museum. Here we were shown a large glass globe, possibly 8 feet in diameter, into which was placed a miniature Universe—the earth, the sun, the moon and the planets with their moons, and all these, one could see revolving in a correct astronomical manner. One could see just how an eclipse of the sun occurs, and at what time of the year and just what part of our earth would see it. It is the most marvelous and wonderful work of science I have ever seen. Every other instrument in that department was working upon some mathe-

matical principle. The first instrument invented in the field of electricity, was exhibited and all others down to the very latest. This was also true of printing presses, photography, musical instruments, etc. I saw the first "Condenser" invented by Liebig, and all the other varieties of condensers, invented since his time. I saw there, the first Bunsen burner made, which, of course, is now greatly improved.

A side trip to Berne was arranged by Dr. Alpers while we were in Lucerne, Switzerland. Only about fifteen out of our party embraced this rare opportunity. We were entertained at dinner by the Swiss Apothecary Society and in the afternoon were invited by Prof. Tschirch to visit the Pharmacy Institute of Berne University. Afterwards a reception in honor of our party was given at Prof. Tschirch's villa. I consider this the best treat of the entire tour; first of all to have come in personal contact with Prof. Tschirch, an authority in botany and pharmacognosy, and, secondly, to have been one of the guests at his home. It is good to be in the presence of such a great man. The Pharmacy Institute is not of the latest up-to-date kind, yet is complete in every detail. Prof. Tschirch prides himself upon having the most complete pharmaceutical library and museum in the world. The museum is a wonder; it contains many thousands of samples of original packages and containers of drugs from all parts of the world. Many of his specimens cannot be duplicated to-day. The professor has ordinarily from twenty to thirty students and hopes never to have more as he makes it a point to give each student personal attention at least once a day. Is it any wonder, therefore, that under such a teacher, Switzerland produces eminent pharmacists?

On Aug. 1st we arrived in the city of Heidelberg. This city has many old historic sights. The famous Heidelberg Castle is located here. Germany had declared war on Russia by this time and we found it rather difficult to visit places of interest. The University was no longer in session but we were able to go through several of the buildings. The guide showed us the room where the final oral examinations are held. The examinations are very hard and occasionally a candidate for a degree, failing to pass will take his life rather than to be disgraced. Students from all countries attend this famous university. Several of our party climbed a hill, of several thousand feet in height, to see the Heidelberg observatory. We were well repaid for our exhausting trip. We were shown a number of powerful telescopes and an instrument which records the vibrations of the earth. Out of curiosity we asked to be shown the chart showing the disastrous earthquake of San Francisco. This chart was produced, much to our astonishment.

Darmstadt was the next city we visited. Merck's Chemical Works are located here. Our party was invited to inspect the factories, but the day before we arrived in Darmstadt, about 5000 of the employees were called to the army, which necessitated the closing down of the factory temporarily. We were greatly disappointed at not being able to visit this noted establishment. Here the party broke up, some remained in Germany thinking it to be safer to remain than to leave, while others left for London. Only fourteen out of the party arrived in the United States on August 20th.

TRUMAN GRIFFIN

Minneapolis.

Responding to a request for a recital of my experiences on my trip abroad with the German-American Apothecary Society of New York City, I will say, I had a most interesting and instructive time and, after we arrived in the war zone, a most exciting time; certainly one hard to duplicate. The ambition of my life to make a foreign tour was fully satisfied.

I visited sixteen cities and the five countries: Germany, Austria, Switzerland, Holland and England. Aside from the educational enlightenment pertaining to pharmaceutical matters acquired, my interest was centered on the characteristics of the people as expressed in their dress, their mode of living and the architecture of their buildings. While the people as a whole do not differ in appearance essentially from those of our own country, I was impressed with the peculiar head-dress of the women of Leipsic, consisting of a very large black ribbon about eight inches wide and two feet long, worn on the back of the head; the wooden-shoe clad people of Holland, and the many colored and peculiarly styled dress, adorning the women of Bremen, were of great interest. The peculiar homes of the people, some of Flemish styles and the peculiar gabled roofs, covered with tiles and even some with sodded moss were very interesting. The architectural beauty of all their government buildings, museums, universities and cathedrals, adorned with works of art and sculpture, and filled with the finest specimens of craftsmanship, faithfully represents the work of men with ideas and imagination.

The palaces of the Imperial families were not impressive, architecturally. Their massiveness, however is pronounced. Their parks and gardens plainly show the work of the landscape artist. Standing at their entrance, you look down broad avenues and roadways, bordered with shrubs and trees, across splashing fountains and broad pools of water, over the many hued colors of their flower beds, on to vine clad walls and columns. Time will not permit me to describe, except in a very general way, the sights I saw; Bremen: Cathedral with its lead chamber of mummies, and the famous Rathskeller. Berlin: University and Pharmaceutical Institute with Botanical Gardens. Auto-ride through the city, famous street

"Unter den Linden," Palace of Kaiser Wilhelm. Entertained by Berlin Pharmaceutical Society at their club building. Suburb of Potsdam; through the Palace of Frederick the Great.

Leipzig: Visited exposition, aerodrome field and drive through the city. Dresden: Visited Grüne Vaults of Royal Palace, wherein were contained precious gems, jewels and antiques handed down by kings and queens.

The art gallery, with over 1500 works of art, contained the priceless treasure, Raphael's "Madonna di San Sisto," within a sanctuary of its own. Vienna: Was received in person by the Burgomaster in the beautiful city. Visited University of Vienna, Museum of Natural History, Vienna Hospital, "Schönbrunn," the summer home of the Emperor. At the Palace of the Emperor we visited the Royal treasury vaults, containing jewels, crowns and coronation robes of kings and queens. Here were exhibited ancient religious relics of the Romano-Germanic times: a piece of wood and a nail from the cross of Christ, a remnant of cloth taken from the table-cloth used at the "Last Supper". Nurnberg:—St. Sebaldus' Church, built between 1240-1477, Church of Our Lady, between 1355-1361, famous wall around the city preserved from olden time with its towers for protection of the city. Munich: "Nymphenburg," the Kaiser's summer palace and park; visited "Alte Pinakothek" containing paintings of old masters, Rembrandt, Van Dyke, Rubens and others; also "Glyptothek" which has a collection of classical sculpture. Lucerne: Alps and beautiful Lucerne. Strassburg—Capital of Alsace Lorraine; drive through old French part of city. Also visited large fort where our carriage was stopped by soldiers who searched us for fire-arms, my first war

BERLIN. OUR SPECIAL TRAIN.

VIENNA. HOLY GHOST DRUG STORE.

experience. Heidelberg: Aug. 1st, war declared against Russia. Reached Frankfurt Aug. 3rd, where we were held for ten days during mobilization; were under restraint all the time. Aug. 3rd, I was awakened at one o'clock, by a bombardment of over twenty minutes; soldiers were firing on a French air-ship which was attempting to drop bombs on a station from which were to depart, that night, thirty-eight train-loads of troops. I was held under suspicion as a spy, but was released on showing my passport. Secret service men were at every hand. We had no direct casualties and on Aug. 13th we folded our tents, asserted our American independence and stole away, sailing nearly two hundred miles down the Rhine into Holland; crossed the English Channel to London and then, via Liverpool, home to our native soil. This was a trip never to be forgotten.

MAX MENZEL

Minneapolis

Since returning to the United States the question has been asked me a number of times: "Are you disappointed in your trip?", referring, of course, to the disturbance and inconvenience caused travelers by the war. To all, I am ready to reply "No." Although I found it necessary to change my program a few times because of the war, I have seen enough to counterbalance any trouble, by witnessing the excitement incident to the soldiers going into the field, which will leave an everlasting impression on my mind.

Perhaps a short synopsis of my trip to Europe will best illustrate the pleasant times I had on the excursion.

July 2nd, the day of our departure across the Atlantic arrived, so we wend our way toward Hoboken, where the North German Lloyd S. S. Barbarossa is anchored, ready to take its load of human freight to the shores of our forefathers. Already most of the passengers are on the dock ready to embark. It is a motley crowd of American citizens, consisting of

about 400 souls, of which about 125 belong to the druggist's party, those who have joined the excursion fostered by the N. Y. Deutscher Apotheker Verein. All is hustle and bustle for about an hour, a farewell shake of the hands of the friends, who have come to see us off, when the band strikes up the national air, the gangways are drawn up, the anchor is raised and soon we are moving away from the dock on an eleven-day journey on the sea, leaving our cares behind. Gliding slowly down the New York harbor, we watch the unequalled line of skyscrapers and the statue of Liberty disappear in the distance, and then a feeling of loneliness creeps over us, which however is soon dispelled, for we look up our Minnesota delegation, consisting of Mr. and Mrs. Chas. Robinson, Mr. and Mrs. Truman Griffin and Prof. Gustav Bachman. Although the weather was fine and the water was smooth, the sea soon demanded its tribute, to which a number of the passengers were hastening to respond before evening. Even our Minnesota crowd did not fail to contribute their little mite.

July 4th, our national holiday, was duly observed by a march of the passengers around the decks, preceded by the band. Patriotic orations were then delivered in English and German.

In the evening a concert was given by the ship's orchestra, interspersed by readings and remarks.

A week passes. Fishing boats and steamers are getting numerous and sea-gulls are following in the wake of the ship, an indication that we are nearing land. Soon the first lighthouse comes into view and then the Scilly Islands. Although almost bare, they are welcome sight after the endless ocean of water.

Sunday, July 12th, about noon, we reached Boulogne-sur-mer, France, where the ship makes its first stop to unload 32 passengers. It seems like losing old friends, for we have become very well acquainted with some of them.

Another 24 hours and we catch the first glimpse of Germany, the mother-country, from which I parted 30 years ago, and to which, next to my adopted country, I owe so much.

After inspecting our baggage, we board a special train for Bremen, where we spend the balance of the day and the next, admiring the old buildings, so rich in history, built centuries ago. One of the most notable being the Cathedral, with its historic lead-cellar, erected in the 12th century.

Arriving in Berlin, during the afternoon of July 15th, the American druggists received a cordial reception by a delegation of Berlin druggists. Arrangements had been made to convey us to our hotels. The next day we were elaborately entertained by the German Druggists' Association. After a sight-seeing tour about the city, we were received at the Association building, where a speech of welcome was delivered by Dr. Salzman, the President of the association, which was responded to by Prof. Alpers of Cleveland, Ohio. We then inspected the manufacturing and wholesale establishment of the association, conducted along coöperative lines and an institution, the workings of which might well be copied in this country. After a sumptuous dinner, we were again taken in "autos" and driven to the Pharmaceutical Institute of the University of Berlin, where a lecture, given by Dr. Thoms, was the principal feature, and then guides took us through the large botanical gardens adjacent to the institute. To finish the day so full of instructive entertainment and enjoyment we were taken out to the beautiful lake "Wannsee". A boat ride around the lake dampened our appreciation of this somewhat, for a heavy rain came up during the trip, which drenched a number of the passengers who were on the edge of the boat. Landing at the "Swedish Pavilion," another feast awaited us, after which, to the music of a fine orchestra, some terpsichorean exercises were indulged in, lasting until the last train took us back to the city. The American druggists all agreed that the Berlin druggists are indeed royal entertainers, and the hope was expressed that an opportunity would be presented to show our appreciation by entertaining them on American soil.

After another day in Berlin, one day was spent in Leipzig and two days in Dresden. On the way from Dresden to Vienna, Austria, we passed through some of the prettiest sections of Germany, called the Switzerland of Saxony. An ever-changing panorama of natural beauty was presented to the eye and fields of various products were spread over the hill-sides and valleys like checkerboards. The harvesting of grain, principally rye, of which there seemed a good crop, was in full swing, most all of the work being done by hand, the women working like men.

We arrived in the city of Vienna on the evening of July 21st, where we were officially received by the druggists of Vienna. We assembled at the University of Vienna, for which the distinction is claimed of being the oldest university in existence. At the Rathhaus we were received by the Vice-Burgomaster, and as a token of good will and of appreciation of our visit, he presented us with an album of the city. His speech of welcome was responded to by Prof. Alpers, who translated the message of the Burgomaster to the non-German-speaking members of our party. While in Vienna, a number of us visited the Imperial Military Direction, where most of the supplies for the Austrian army are prepared. There we witnessed the packing and cutting of cotton and gauze and the filling of ampoules by the vacuum system. We found this place a very busy one, for the war cloud was then already hanging over Austria. We visited a couple of well-appointed pharmacies and found that business is conducted there about as it is here. The patent medicine evil seems to have

encroached upon the foreign market about as much as here. Found many of the old-time American nostrums on the shelves of the drug stores in Austria as well as in Germany. One thing that struck us odd was that every drug store is named after animals or other objects, the strangest one, perhaps, being the "Apotheke zum Heiligen Geiste." (Pharmacy of the Holy Ghost).

Leaving Vienna on the morning of July 24th we started for Nuremberg. One of the places pointed out to us on the way was the castle of the late crown-prince of Austria and his wife, whose untimely death is the cause of the present European war. They are interred there in a mausoleum, built under the direction of the crown-prince during his life.

No doubt, from an historic point of view, Nuremberg is the most interesting of the cities we visited. The old buildings and their quaint style, give the city an appearance so different from any place I know of. In feudal times this city was surrounded by strong city walls with moats between them. Much of these walls still remain in a fair state of preservation with many towers. Four main towers represented the four seasons of the year, twelve smaller ones to represent the twelve months of the year, 52 to represent the 52 weeks and 365 to represent each day in the year, with an additional one for the extra day in leap-year. However, I would not vouch for the correctness of this statement as the veracity of the sight-seeing guides is sometimes questionable.

Sunday, July 26th, we arrived in Munich, where great excitement prevailed on account of

MAX MENZEL, MINNESOTA.
"A Soldier of the Legion."

BERN. AT THE HOME OF DR. TSCHIRCH.

the declaration of war between Austria and Servia. Thousands of people were lined up in the square adjacent to our hotel, where the night before an altercation had arisen between a Servian restaurant-keeper and his guests, because he had refused to allow patriotic songs to be played by the orchestra. His guests, mostly students, became angry at his refusal and demolished the place. All of the fine marble tables, chandeliers and furnishings and every plate glass window, of which there were many, became a prey to the fury of the mob. It took a number of foot and mounted police to keep order about the place and open the way for street cars and vehicles to pass. July 28th found us on the way to beautiful Switzerland. Feasting our eyes on the wonderful scenery during this trip, we arrived in Lucerne about supper time. Unfortunately the next day was somewhat cloudy and unsuitable to get the full benefit of the scenery for which Switzerland is so justly famous. So while the greater number of our party decided to climb the noted "Rigi," with the expectation that the clouds would be lifted, a few of us decided to accept the hospitality of the celebrated botaniker and pharmaceutical instructor, Dr. Tschirch of Bern. Dr. Tschirch, who received us in person at the depot in Bern, at once conducted us to the Pharmaceutical Institute of the University, of which he is the dean. He showed us a great many things of interest, of which might be mentioned his pharmaceutical library, the second largest in existence, also a very unique collection of containers of crude drugs, perhaps the only collection of its kind in the world. A hurried inspection of the industrial exposition of Switzerland was then made, of which I want to say that although it was small, it was the best of its kind I have ever had the pleasure to see, showing the wonderful resources of this small republic. Not content with administering to our intellectual need, Dr. Tschirch and several of his able assistants did not neglect our physical wants, but took us to a very fine restaurant of the

exposition, where previous arrangements had been made for a sumptuous banquet. A drive about the city of Bern, surrounded by majestic snow-capped mountains, to the beautiful villa of the doctor, where another luncheon awaited us and a few hours of unrestrained enjoyment in the circle of his estimable family was spent, ended our visit, which will ever stand out in our remembrance as one of the most pleasant events of our European trip.

Regretting to leave this land of natural beauty we departed for the city of Strassburg, Germany, on the morning of July 30th, arriving there after a five hour ride. The time to look over this city was very limited, for we left again the next day for the University city of Heidelberg. A guide conducted us through this famous place of learning, where the traditional student life with its duels and drinking feasts are still carried on as of yore. One of the features for the tourists to see, is the "Carcer" or prison of this institution. It seems to be the ambition of the students to bear the distinction of having been incarcerated there, and they will sometimes go to extreme lengths to realize their desire. A visit to the ruins of the old castle Heidelberg, is worthy of mention. One of the features to be seen there is a colossal wine barrel, holding 49000 gallons. During its existence it has been filled three times the last time in the 18th century.

August 2nd, the first day of the mobilization of troops for the war, finds us in Darmstadt, the home of the world renowned house of Merck. Entertainment was to have been provided there for us, with a visit to their factory of chemicals, but the war is about to begin and time is too valuable to stop for the entertainment of guests. Great excitement prevails, caused by the gathering of troops of cavalry and artillery. Big auto-trucks are busy all over the city, picking up supplies and hundreds of "autos" and trucks are gathered together on a vacant square ready to be rushed to the front. Sight-seeing is a thing of the past, for our crowd is about to break up. We are told that our special train will not take us any farther and that everybody must look out for themselves, to get to the next place on our list. The exodus of people has commenced and various trains, crowded to the utmost, land our party at Frankfurt. Informed that the railways will take passengers only two days longer, that thereafter every train is to be used for the movement of troops only, we lose about half of our crowd, who rush to various ports to get transportation to our peaceful country. The balance stayed at a very good hotel, where arrangements had been made for our care, until the excitement incident to the first days of the war and the movement of troops was over, and arrangements had been made for the return to our beloved U. S.

C. A. ROBINSON

Minneapolis.

We sailed on a German boat, the Barbarossa, leaving New York July 2, under the auspices of the German Apothecaries' Association of New York. Ten days' time was consumed in the passage from America to Germany. On the 13th of July, we arrived at the city of Bremen, a beautiful place of well-kept homes, public buildings and residences. I must certainly give the German nation credit for the great care they take and the immense amount of work they must do in keeping their cities, villages, and the entire country in a clean, wholesome and well-kept condition. Members of our party were much interested in one sort of business that I for one did not know existed in that country and that was known as a droguerie; that is, a store where supplies are sold and dispensed outside of the prescription business or what would be known as a dispensary. These stores sell patent medicines, proprietary articles, fancy and toilet goods but do no dispensing or prescription work whatever. Our method of travel was by a small special train of six cars or coaches. We were under the direction of a conductor who in turn was guided by the company in whose care we were, and from whom we purchased our steamship, hotel, railroad, transportation, "bus" and baggage tickets. The time consumed in traveling between Bremen and Berlin was far from being tiresome or uninteresting as we passed through many small cities, towns and a beautiful country. The latter resembles our western territory with the exception, of course, that it is under a high state of cultivation and well populated. There are very few large farms, nearly all being, as near as we could judge, from five to forty acres in extent. The principal crops are rye, wheat, oats, sugar-beets, poppy seed. Very seldom would we see a field of what we call Indian corn. Arriving at Berlin, we were met by the professors, instructors, and members of the college of pharmacy and conducted to our hotels. Berlin is a beautiful city and as you know the largest in Germany, with clean, well paved, wide streets, beautiful parks, and even the congested part of the city as wholesome and clean as the outlying districts. The medium and high-class hotels are a great credit to the city, everything about these places showing great care as to general cleanliness. There are no back-alleys, for tin cans, rubbish or garbage. The courts of these hotels, usually filled with unsightly objects in our country, are perhaps the cleanest and best kept parts, where white cloth-covered tables and chairs, graveled walks and overhanging trees and palms enable one to enjoy a meal in a very pleasing and satisfactory manner. The story would be too long to tell you of the many receptions and entertainments afforded our party in the city of Berlin, all carried out in a business-like manner by the members of the colleges and places of learning who received our party.

Of course, the entire trip gave us only a bird's-eye view of these cities and the country, and yet to tell you every point of interest visited and every entertainment afforded us would take

too much time. While in Berlin, our association and party was given a reception by the American Ambassador, and his wife, Mr. and Mrs. Girard. Several of our party were somewhat startled at receiving this invitation, thinking that perhaps they would be called upon to wear dress-suits, but Mr. Girard at once eased our minds, by saying that it would be strictly informal, and, when we arrived at his house, we found that this democratic gentleman had kept his word and he appeared in his business suit, not at all more showy than any member of our party. He and his wife mingled with the company, expressing themselves as pleased indeed to see friends from America.

Our next stop was at Leipzig, certainly an interesting city, where we were very much interested in seeing the general conditions existing and the manner of living in this old German town. From Leipzig we went to Dresden, another beautiful, well kept, small city where we visited numerous old churches and enjoyed trolley and automobile trips about the city and surrounding country. From Dresden we proceeded to Vienna, the capital of Austria and here we were again received by those interested in pharmacy and they seemed untiring in their efforts to see that our party of Americans were well taken care of. Interesting visits were made to the hospitals and places of learning, and to the many beautiful parks and museums. I believe our most interesting ride was from Vienna to Nuremberg, and hardly a moment passed but what exclamations of surprise were heard as we passed through the beautiful country and along the valley of the river Danube. Fruits were being gathered, the harvest was just commencing and as our train passed through the country, we saw the methods of harvesting and general farming carried out in Europe. Very little machinery was seen. Occasionally, one of the old time reapers was observed. Most of the grain is cut with what we would call a cradle, not the heavy sort used in America but a light three-pronged affair, the grain, of course being laid on the ground and bound later. Hundreds of smaller fields were cut in the manner of Bible times by grasping a handful of grain and then cutting with the old fashioned grass sickle. A great deal of this, of course, was done by women. The farmers do not have their little homes located on each separate farm or tract of land but build them in little villages from two to three miles apart. Occasionally, where there was a large population, a small church spire would be noticed. Nearly all railroad crossings are either over or under the tracks; there are very few grade crossings, but where there are an attendant is at hand and gates are raised and lowered. As far as the eye could reach, these small farms could be seen stretching away over the rolling country all in the highest state of cultivation. In passing through wooded sections, no rough territory would be seen; that is, every log, branch, or twig had been cut and preserved in the homes of the villagers, piled up and covered, so that all could be made use of in winter. A certain wild flower or weed that is troublesome in that country, is a wild poppy, a very pretty blossom and was really ornamental. At nearly all of the larger stations that we passed through our train would stop long enough for the members of our party to disembark and obtain light lunches, such as sandwiches and the liquid refreshments which Germany is so famous for; beer, Rhine and Mosel wine. Nuremberg is the center of the German toy industry. From this point we went to Munich and in describing a trip in Germany, our strictly temperance hearers must bear with us if we mention the all important industry of this city, as it is known as the beer center of Germany. Beer, however, in Germany must not be compared with the product of this country, as you all know that the amount of alcohol in beer in Germany has been considerably reduced, as we understand the Kaiser realized the vast amount consumed and that perhaps it would be better for his people that this step be taken. At this city, the first, (or at any rate the first we saw) marked indications of war presented themselves and on the morning of our arrival we saw large plate glass windows in the retail stores that had just been broken by the mobs in their endeavors to capture Russian spies. Nearly all night long, great crowds paraded the streets singing German songs and cheering for their country. We went to Lucern, Switzerland, next, a beautiful country of snow-capped mountains, fertile valleys and pretty towns.

An invitation was received at Lucern on our arrival extending an invitation for those of our party who were interested to visit the capital, Bern, about fifty miles from Lucern. Here is located the pharmacy college under the direction of Professor Tschirch. Nothing was left undone to make it very pleasant for about 15 members of our party who decided to make the trip to Bern. Strassburg, located near the French border, was our next viewpoint, equally as interesting as the other cities we had visited and noted for its beautiful churches, statuary, and interesting scenery. Heidelberg, next on our list, was interesting on account of its University and the great number of students, its old historic castle, which brings many visitors to the city. At this city we were astonished to see such strong manifestations of war, troops marching, cavalry mobilizing, cannons and horses being transported and every day appeared stronger manifestations of war. In fact at this point some of our party, who were perhaps a little too free with their cameras, were arrested, in view of the fact that war had been declared at this time, but they were quickly released when it was known that they were Americans and members of our party. On our arrival at Darmstadt where the firm of Merck & Co. is located, a reception committee from this company met us on our arrival, and informed us that if it was our intention to endeavor to proceed to France, they greatly feared that we would never reach that country and would not have an opportunity of seeing the city of Paris and I regret to say that this proved true. These representatives of Merck & Co.

informed us that over five thousand men had been taken out of their laboratory and were already in uniform prepared for war. Darmstadt is a mobilizing point, barracks being located there, and all day Sunday, the day of our visit, soldiers of all ages, from seventeen to fifty years, were parading the streets in their new uniforms. All day, trains were arriving bringing, from the surrounding country, men and boys, in their citizen's clothes, with their little parcels of personal belongings, to the barracks that they might receive their uniforms and equipments. We left Monday morning going directly to Frankfort, but were destined to be disappointed regarding the balance of our trip, for while we were enjoying our luncheon, the conductor of our party informed us that the last regular train would leave Frankfort at 3 o'clock that afternoon. After that hour, all the trains would be taken over by the war officials for moving their troops to the front. A hurried consultation was held and about thirty-five of our party decided to take this train and go hurriedly across the country to Cologne on the Rhine River, crossing that river at Coblenz, where the famous Appollinaris Springs are located. The ride along the Rhine afforded us many beautiful sights.

We arrived at Cologne about 10 o'clock at night but were not allowed to get out of our coach. We were ordered to keep all lights burning and windows closed. The railway officials informed us that while it was known that we were an American party, the German army officials did not know who might be with us, as spies who might drop messages from the windows. From this point our route was almost due west through a small part of Germany and across Holland to the town of Flushing, on the Holland coast, where we arrived the next morning at about 9 o'clock. At this point we embarked on a Holland boat to cross the English Channel.

We arrived at the town of Queensboro about 6 o'clock in the evening, after having been stopped a number of times by British cruisers who sent officers on board our boat to investigate as to what passengers were carried. Our party arrived at the city of London about 9 o'clock in the evening, and experienced some difficulty in securing hotel-quarters, owing to the general rush to London from the continent by American tourists. Our stay in London was quite pleasant for about ten days, and we were enabled to visit many interesting points in the city and surrounding country. At the end of this time our party gradually broke up, different ones leaving London on the many steamship lines, especially British and American, that would take them back to good old America.

At this writing even, Oct. 20th, not all of our party have reported as having returned, as all did not take advantage of the last train as we did in getting out of Germany, but trusted that opportunities would present themselves, to enable them to eventually leave the country safely.

The statue of Liberty certainly did look as good to the many returning tourists, we feel sure, as it did to the writer. We are now very glad that we went and are equally pleased and satisfied to get back.

MEDIEVAL EXECUTION TOWER, NUREMBERG

Proceedings of the Local Branches

CHICAGO.

The November meeting of the Chicago Branch of the American Pharmaceutical Association was held at the School of Pharmacy Building, Tuesday evening, the 17th.

President James H. Wells presided and introduced Mr. Fred A. Miller, Botanist of Eli Lilly & Co., Indianapolis, who addressed the meeting on the subject, "The Cultivation of Medicinal Plants." His address was illustrated with many lantern slides, showing the detailed processes for the practical cultivation of various drug plants, including those yielding Belladonna, Digitalis, Stramonium, Althæa, Larkspur, Cannabis and Conium.

The address was very enthusiastically received by the audience of more than one hundred who voted it not only interesting but very instructive. A number of druggists outside of Chicago were present, including Mr. J. C. Wheatcroft, of Grayville, W. C. Irwin, of Salem, P. L. Gain, of East St. Louis, and Professors G. D. Timmons and E. H. Wisner, of Valparaiso, Indiana.

CINCINNATI.

The regular monthly meeting of the Cincinnati Branch, A. Ph. A., was held at the Cincinnati College of Pharmacy on Tuesday evening, November 10th.

President E. H. Thiesing directed a short business session, during which the minutes of the previous meeting, as read by the Secretary, were approved.

The President then introduced Mr. D. E. Murphy, who presented a very efficient paper, entitled: "The Folly of Not Filling the Demand." He aimed to show that, by the antagonism manifested by the druggist toward the products of the manufacturing pharmacists, who spend large amounts of money, special thought and energy to create a market for them; that the druggist has himself to blame for the coining of such words as "Substitutor" or "Substitution," and not alone that, but he has created an impression upon the public mind, of hesitancy and suspicion, not alone against medicinal products in general, but against the druggist himself.

The paper is full of meat and it led to a discussion, in which Mr. Freericks, Mr. Greyer, and others took part, and there is no doubt, that this subject will be taken up again for discussion at future meetings. Mr. Murphy was tendered a vote of thanks, after which President Thiesing introduced Prof Chas. T. P. Fennel, who chose for his subject: "The Early History of Chemistry." The lecture was profusely illustrated with pictures showing the earliest evolution of mankind, laying particular stress upon the ever recurring presence of Fire, which always attended the first development of man, the first workings of the precious metals, the first application of distillation, and always, the sacrifices of the people's offerings to their gods. The lecturer took his audience from the earliest pre-historic times to the Phœnician, Egyptian and Arabian periods; to the recognition of Fire, Water and Air as elementary bodies; through the field of alchemy up to the more modern development of chemistry. A very pleasing feature was the exhibition of books and manuscripts, some more than 300 years old and bearing the individual writings and signatures of such men as Scheele, Priestley, Lavoissier, Gay-Lussac, and others.

Professor Fennel was given a rising-vote of thanks. The meeting was well attended by members and their friends; the student body of the Cincinnati College of Pharmacy, as well as a number of the faculty and students of the Cincinnati Eclectic Medical College being present.

All voted to have spent an enjoyable and instructive evening.

CHARLES A. APMEYER, Secretary.

NASHVILLE.

The Branch held its regular meeting at Bloomstein's Hall on Church street, Thursday evening, November 19th, with President J. O. Burge in the Chair. Dr. E. A. Ruddiman made a full report of the Detroit meeting of the A. Ph. A., stating that it was the best meeting he had ever attended.

Mr. C. S. Martin, Ex-President of the National Wholesale Druggists' Association, by invitation, addressed the Branch on the subject of "The Effect of Recent National Legislation on the Drug Business." He gave a short history of the enactment of the war stamp tax bill by Congress and congratulated

the druggists of the country on their united efforts in defeating the tax on proprietaries. The Senate, he said, were very insistent on the provision and only receded, after they had been flooded with an avalanche of protests from all over the United States.

He explained the section of the law imposing a tax on toilet articles and cosmetics. Most retail druggists, he said, are manufacturers of some toilet preparation, and he urged them to be ready to comply with the law when it becomes operative December 1st. He reminded them of the tax on cigars and tobacco stands, doing a business over \$200 a year. Also of the tax to be levied on telephone messages over 15 cents, and on telegrams, promissory notes, contracts, deeds, insurance policies, bills of lading, express receipts, etc. He urged them to study the Clayton bill, especially the provision relating to exclusive agencies.

Dr. E. A. Ruddiman and J. B. Sands were appointed as a nominating committee to select the names of candidates for the various offices of the Branch to be voted on by mail. The Branch decided to meet at Bloomstein's Hall on the third Wednesday of each month at 3 p. m. Refreshments were then served.

W. R. WHITE, Secretary.

NEW YORK.

The October Meeting of the New York Branch of the American Pharmaceutical Association was held on the evening of the 19th. Dr. H. V. Army was in the chair.

The minutes of the previous meeting were dispensed with.

Dr. Joseph Weinstein's report showed the Treasury to be in a healthy condition.

T. D. McIlhenie reported progress for Council of the parent association.

Louis Berger, Chairman of the Committee on Fraternal Relations, had no special report to make but referred to the work done during last spring and stated that matters generally were progressing satisfactorily.

R. P. Fischelis was elected to membership and at that time the Secretary called attention to the fact that 36 new members had been added to the roll in the past nine months.

Dr. G. C. Diekman reported on the Progress of Pharmacy, covering the determination of Camphor in ointments, the assays of certain volatile oils and Cinchona, Weinber-

ger's Whooping Cough Mixture, the decomposition of Linseed Oil by microorganisms, and the estimation of free Sulphuric Acid in Copper Sulphate. The report was discussed by Messrs. McIlhenie, Raubenheimer and Army.

Dr. William C. Anderson, Chairman of the Committee on Legislation, discussed the present status of the Harrison Bill, called attention to the Stevens Bill, the Stamp Tax, and also stated that Attorney-General Parsons of the State of New York had rendered an opinion that the amended section 182 of the Sanitary Code of the City of New York was in conflict with the Boylan State Law. He stated that the Boylan Law was working out satisfactorily. The report was discussed by Messrs. Murray, Raubenheimer, Fried and Weinstein.

The speakers of the evening were Messrs. Caswell A. Mayo, William C. Anderson, William Mansfield and Jeannot Hostmann. They reported on the association meetings of the past summer.

Caswell A. Mayo, President of the parent association, reported on the recent meeting of the A. Ph. A. and strongly urged all members to make it a practice to attend the yearly meetings. He pointed out that, aside from the valuable information and benefit gained by hearing the opinions of the members of the profession, friendships were made which continued throughout life. He stated that each year the meeting was conducted in a more businesslike manner. He praised the local committee whose work was efficient. Mr. Mayo stated that the papers presented before the Scientific Section were not of transcending importance this year. He has recommended to Dr. Herman Engelhardt, the newly-elected Chairman of the Scientific Section, that the work and study for this year should be concentrated on specific subjects. He recommended that all members of the association should feel that they are on the membership committee and laid stress upon the desirability of increasing the membership of the A. Ph. A.

Mr. Mayo stated that the meetings of the Section on Commercial Pharmacy were very interesting and well attended.

Dr. Weinstein's request for a report on the Diastase Club met with applause, as did also the report, which was interesting and amusing.

Dr. William C. Anderson made the report

on the Philadelphia Meeting of the N. A. R. D., calling attention to the price protection work being done. He stated that the membership had been increased and that the treasury had a good balance on hand.

Extensive reports were made by the Legislation Committee, as well as the Committees on Pharmacy Laws, Telephone, and Propaganda.

The discussions were interesting, stated the speaker, and the entertainment was characteristic of hospitable Philadelphia.

Dr. Anderson dwelt upon the importance of the vast amount of work being done by the Legislation Committee, and stated that all retail druggists should join the N. A. R. D. and support them in the good work they are doing.

Dr. William Mansfield reported that the New York Pharmaceutical Association Meeting was fairly well attended.

The real interest was the President's address in which important recommendations were made.

An unprecedented increase in membership was made during the year due to the efforts of Messrs. Riefflin and Smith.

Dr. Mansfield called attention to the scarcity of scientific papers.

Dr. Jeannot Hostmann followed with an interesting account of the New Jersey Pharmaceutical Association Meeting held at Lake Hopatcong. He indicated that about 260 were present and stated that President Holzhauer's annual report dealt largely with legislative matters. He stated that the association had a membership of about 850. Some twenty papers were read and all, with the exception of two or three, were written by retail druggists. It was the speaker's opinion that Raubenheimer's paper on "Dont's in Pharmacy," and Gallagher's paper on "Poison Laws" were of particular interest. He also stated that the entertainment given by the Commercial Travellers was unusually good. The reports were discussed and commented upon by Messrs. Raubenheimer, Diner, Army and Roemer.

The meeting then adjourned.

FRANK L. MCCARTNEY, Secretary.

PHILADELPHIA.

The regular monthly meeting of the Philadelphia Branch of the American Pharmaceutical Association was held on Tuesday even-

ing, November 10, at the Philadelphia College of Pharmacy. President E. Fullerton Cook presided. The minutes of the last meeting were read and approved.

The committee, appointed at the October meeting to audit the treasurer's accounts, reported them to be correct.

Under the heading of "new business," Prof. C. H. Lawall introduced a resolution protesting against the opinion of the Chief of the Bureau of Chemistry of the Department of Agriculture, in which he states that the word "dram" unqualified, means 1/16 of an avoirdupois ounce. The resolution was passed and copies were ordered to be sent to the Chief of the Bureau of Chemistry of the Department of Agriculture and to the various pharmaceutical journals for publication. The full text of the resolution is as follows:

"The Philadelphia Branch of the American Pharmaceutical Association do hereby

Resolve: That we emphatically disagree with the opinion of the Chief of the Bureau of Chemistry of the United States Department of Agriculture as expressed in General Information Opinion No. 66, issued July, 1914, in which he states that the word "Dram" unqualified, means 1/16 of an avoirdupois ounce.

This is contrary to all pharmaceutical teaching and usage, and as the use of the word would largely be applied to medicinal products the impression created by the use, thus authorized, of the word would be misleading and might lead to serious results. The word dram, unqualified, should be held to mean 1/8 of an apothecaries (or Troy) ounce, which is 60 grains."

Professor Lawall also introduced a resolution protesting to the editors and publishers of Pearson's Magazine, against the publication of the article "Pills and Piracy," by Sloane Gordon, in the November issue of that magazine. The resolution was passed and copies ordered sent to the editor of Pearson's Magazine and to the various pharmaceutical journals for publication. The full text of the resolution is as follows:—

"The Philadelphia Branch of the American Pharmaceutical Association do hereby

Resolve: That we protest most energetically to the Editors and Publishers of Pearson's Magazine against the publication of the article "Pills and Piracy" by Sloane Gordon, in the November issue of the Magazine and condemn it as unfair and misleading in that it takes no cognizance of the care and skill exercised and the high educational attainments required to conscientiously practice pharmacy and avoid errors in the preparation and dispensing of physicians' prescriptions. If the underlying principle upon which

the author's article is based be admitted then barbers would only charge for the soap used in a shave and authors would only be permitted to charge for their paper and ink.

We not only ask that such articles be refused in the future but that some editorial expression of error or regret at the publication of the article in question be made in one of the issues of the near future and that this resolution be sent to the Editor of Pearson's Magazine and to the various Pharmaceutical Journals for publication."

The programme of the evening was then taken up and Dr. C. E. deM. Sajous read a paper dealing with "The Use and Therapeutic Value of the Popular Animal Glands."

Dr. William Jay Schieffelin, of New York, read a paper discussing, "The Use of Standardized Radium Emanations in Medical Practice."

The papers were interestingly discussed by Messrs. W. L. Cliffe, F. E. Stewart and H. C. Wood.

Mr. Franklin M. Apple was unable to present "The Review of Current Pharmaceutical Literature," being called out of town by the illness of his father. (Mr. Apple's paper appears in this issue.)

A vote of thanks as proposed by Prof. F. P. Stroup, was given to the contributors of the programme after which the meeting adjourned.

J. ED. BREWER, Secretary.

WASHINGTON.

The November meeting of the City of Washington Branch of the American Pharmaceutical Association was held on the 18th instant, at the National College of Pharmacy.

After disposing of the routine business and the selection of Messrs. Lewis Flemer, Martin I. Wilbert, and H. C. Butler, as a nominating committee to report at the December meeting, nominations for officers, Mr. W. S. Richardson introduced Dr. Wm. J. Schieffelin, of New York, the principal speaker of the evening, who gave a most interesting and instructive lecture on the physics and chemistry of Radium. A number of instruments used in the estimation of various forces which Radium exerts, were presented and their application fully explained. Dr. Schieffelin volunteered to answer questions on the matter of Radium and was kept long in the evening answering the queries of the members and their guests.

The meeting was the best attended since the organization of the City of Washington Branch.

The program for December, in addition to the election of officers, includes two papers, "Poison Plants of Stock Ranches," by Dr. C. D. Marsh, postponed from the November meeting, and "Chenopodium, or American Wormseed," by Dr. William Salant.

HENRY B. FLOYD, Secretary.

SAINT LOUIS.

The twenty-eighth meeting was held in the Saint Louis College of Pharmacy, Friday evening, November 27, 1914. After the disposal of the routine business, President Buehler announced his appointments on the Committee on Membership—Dr. Charles E. Caspari, William F. Kahre, Victor H. Krummenacher; Committee on Program—Leo R. Suppan, Louis Lieberstein, E. A. Sennewald; Committee on Legislation—Julius C. Hoester, Francis Hemm, J.P. Schoenthaler; Memorial Committee—William Gunn, Gustav Kring, Otto N. Speckart; Honorary Members on the Advisory Board—William Mittelbach, Ambrose Mueller, Adolph Brandenberger.

The Secretary then read a letter from Prof. Charles H. Rogers, Morgantown, West Virginia, in which he complimented the Branch upon the work it has accomplished. The Chair called upon Dr. Whelpley, who detailed the work that Mr. Rogers is doing for the upbuilding of pharmacy and of his efforts in promoting the West Virginia Branch.

Mr. Buehler read a paper on "Restrictions in the Distribution of Poisons." The paper, "The Sale of Poisons," as contributed by Mr. Mittelbach, Booneville, Mo., was read. Both papers were discussed from many viewpoints by Messrs. E. H. Wolff, Charles Gietner, Dr. Rehfeld, J. P. Schoenthaler, Paul Goodale, Prof. J. M. Good, Dr. Whelpley, M. J. Noll, Dr. O. F. Claus, Frederick Wolff, C. H. Bierman, Julius C. Hoester, Dr. O. A. Wall, Sr., and J. W. Mackelden.

The Chair stated that nominations were in order for a delegate in the Council of the parent body to succeed Mr. Ilhardt, whose time had expired. Mr. Jerome A. Wilkerson was elected unanimously to represent the Branch for three years.

The Chair stated that the next meeting will be held, December 18, at 8:30 p. m.

JULIUS C. HOESTER, Secretary.

College and Society

ILLINOIS PHARMACEUTICAL ASSOCIATION.

The semi-annual meeting of the Executive Committee of the Illinois Pharmaceutical Association was held at the office of the Secretary in Chicago on Tuesday, November 17, 1914.

The morning session was called to order at 10 o'clock and it was decided to hold the next convention at Centralia, June 15, 16 and 17, 1915.

The treasurer's report was read and showed that the expenses since the annual meeting were \$537.98, the receipts \$400.00 and the balance on hand in the general fund \$1122.65 and in the permanent fund \$600.00. Appropriations for the various standing committees were granted as follows: Legislative Committee, \$600.00; Propaganda Committee, \$100.00; Trade Interest Committee, \$25.00; School of Pharmacy Committee, \$25.00.

It was voted to charge a registration fee of one dollar for each person for registration at the annual convention.

A committee consisting of Messrs. W. C. Irwin, R. E. Dorland and I. M. Light were appointed to cooperate with the Illinois Pharmaceutical Travelers' Association in making arrangements for the Centralia meeting. Upon motion, Mr. Henry Schaper, President of the Chicago Drug Club, was added to this committee.

Upon motion the Secretary was instructed to write to the Postmaster General in regard to a ruling concerning the mailing of poisons, especially when these are physicians' prescriptions.

Nominations for the voting cards were made as follows:

Board of Pharmacy—W. W. Klore, O. U. Sisson, D. P. Seibert, C. M. Friesenecker, John Chwatal, L. P. Larsen, Geo. Moyer, Henry Eckart, C. A. Storer, Frank Ahlborn, C. F. Schultz, J. T. Murray, R. H. Slade, Aug. Sundine, Geo. G. Johnson, John Harsch, Chas. Frison, F. E. Blake, E. P. Hilligoss, Byron Armstrong, R. E. Dorland, P. L. Gain, Fred Pfaff, T. D. Gregg and H. C. Schuh.

Advisory Board—O. P. Stephan, C. F. Moritz, J. T. Lueder, F. M. Mares, Chas. Foucek, A. E. Letzler, George J. Guerten, John Lambrecht, Otto Mentz, C. H. Burkett, L. C. Staudt, W. B. Hattenhauer, Chas. Gustafson, F. G. D. Walker, W. S. Clintock, W. V. Dufner, S. D. Van Deventer, H. B. Rowe, S. M. Riggs, J. W. Doyle, E. A. Sells, P. H. Paul, F. J. Nirider, Royal Davenport and F. H. Kroh.

Several letters from members of the Committee who were unable to be present were read and correspondence with several other Associations was presented by the Secretary, who likewise made a report of his efforts in behalf of the Stevens Bill. None of these matters required action. The meeting adjourned late in the afternoon after an invitation had been received from the Chicago Branch of the A. Ph. A. to attend its meeting held the same evening.

W. B. DAY, Secretary.

<>

THE COLLEGE OF PHARMACY OF THE STATE UNIVERSITY OF IOWA.

The Junior class has elected the following officers: President, R. E. Everly, Canton, Ill.; Vice President, J. C. Lick, Dubuque, Ia.; Secretary-Treasurer, Lucile S. Shirchiff, Solon, Ia.; Yell Leader, W. R. Jennings, Red Oak, Ia.

The first annual conference of the College of Pharmacy was held at the Pharmacy building Friday afternoon, October 23. The conference was opened by Dean Teeters, who extended a welcome to the visiting alumni. The first paper, "Price Cutting and Its Demoralizing Effects," was by H. H. Springer, who emphasized the point that price cutting does not inspire confidence or help to establish a reputation for business integrity. The "Medicine Wagon" was the subject of a talk by Prof. R. A. Kuever. Prof. Kuever reviewed some papers published recently in a drug journal. His discussion brought out the fact that the use of patent medicines is on the decline and that no druggist should encourage their sale, particularly by sending wagons into rural communities, when he knows that self-medication is dangerous. Such a business is unprofessional and unscientific and especially to be discouraged

when ethical pharmacy offers a field broad enough for all and remunerative as well.

Following is the program in full:

"Why Experience Counts," O. L. Moffett.
 "Price Cutting and Its Demoralizing Effects," H. H. Springer.

"Salesmanship," E. M. Wertz.

"Drug Sundries," M. B. Herrald.

"The Peddler's Wagon," Prof. R. A. Kuever.

The papers were discussed by J. M. Canty, H. E. Weld, W. E. Palmer, G. E. Mace. Arrangements were made to hold a conference each year at "Homecoming," and a committee will be appointed by the president to arrange a program. The following officers were elected: President, H. H. Springer; Vice President, H. H. Gibbs; Secretary-Treasurer, H. M. Doden.

Phi Delta Chi held the first initiation of the year at the College on the evening of October 23. The initiates were W. R. Jennings, C. A. Pates and R. S. Potter.

Mortar and Pestle began their programs for the year on the 20th of October. Professor Bohumil Shimek gave a most interesting talk about his experiences in Europe during the past summer, dwelling especially upon the conditions of life among the common people. He also told some very interesting things which show the contrast between systems of education in universities there and in America. The second meeting was held November 3. G. J. Zopf talked on "What Constitutes an Efficient Drug Clerk."

Phi Delta Chi celebrated Founder's Day, November 2, with a banquet at the Hotel Jefferson. Dr. C. S. Chase acted as Master of Ceremonies, and the following after-dinner program was carried out:

"The Pharmacy College and Phi Delta Chi,"—Dean W. J. Teeters.

"Our Grand Council"—A. B. Wagoner.

"Fraternity,"—Professor R. B. Davis.

"The History of Phi Delta Chi"—Professor R. A. Kuever.

"E. Pluribus Unum"—Dr. W. J. Karslake.

"The View Point of the Pledge"—W. R. Jennings.

"The Fraternity House"—L. K. Fenlon.

This was the thirty-first anniversary of the founding of Phi Delta Chi fraternity at the University of Michigan. The chapter at the University of Iowa, known as Nu Chapter, is in good condition and their records of scholarship are of the highest order.

Of General Interest

COMPLIMENTARY DINNER.

The Northern Ohio Branch of the American Pharmaceutical Association and the Trustees and members of the Cleveland School of Pharmacy entertained Dr. W. C. Alpers at dinner on Wednesday evening, December 2, at the Cleveland Athletic Club, the occasion being in honor of the election of Dr. Alpers as President of the American Pharmaceutical Association.

The banquet was attended by all of those prominent in the profession in Cleveland, and was a most interesting and enjoyable function, a well-bestowed honor to the next President of our Association.

"The result of the balloting for officers in the American Pharmaceutical Association is of unusual interest and especially gratifying to Clevelanders, inasmuch as Dr. Wm. C. Alpers of this city was elected President of the Association, and Dr. H. V. Army, formerly of this city, was made a member of the Council. Quite apart from any justifiable local pride we feel that the A. Ph. A. is to be congratulated in securing the services of these two men in an executive capacity. That they have commanding ability, wide experience and erudition goes without saying, no man is called to leadership in the A. Ph. A. who has not these. But beyond that both have an intimate and first-hand acquaintance with the rank and file of the drug trade, and this is fortunate. The A. Ph. A. is unquestionably the oldest and most representative pharmaceutical association in America, but there is extant a very definite and widespread though ill-founded notion that the A. Ph. A. is a "high brow" organization. That its members and leaders are pharmaceutical "blue stockings," so to speak, men who have not had the experiences of the average druggist and therefore can not be in sympathy with him. Wherever this notion has prevailed it has invariably produced a feeling of indifference, if not indeed hostility, towards the association on the part of the retail druggist and his clerks, and the election to executive positions of men like Alpers

and Army will do much to dispel it. And this, we repeat, is fortunate. The average druggist needs the A. Ph. A. and what it stands for quite as much as he needs anything; and the A. Ph. A. in turn can not afford to get too far away from him, lest it lose "the common touch" and so fall short of what it aims to be, "the clearing house of American pharmacy."—*Association News, Northern Ohio Druggists Assn.*

EXECUTIVE BOARD OF THE A. D. F. I. CO.

The third quarterly meeting of the A. D. F. I. Co. was held in Cincinnati on Friday and Saturday, November 20th and 21st. Messrs. Chas. H. Avery, L. G. Heinritz, Jas. H. Beal, Geo. B. Kauffman, Walter Rothwell, A. O. Zwick, and Frank H. Freericks were in attendance. Preliminary arrangements were made for the directors and stockholders meeting, which takes place on the 9th and 10th days of February. Many important matters found consideration on the part of the Committee, inclusive of entering some additional states for business.

The first nine months of the year have shown a splendid growth in the business of the company, and it seems now that from every viewpoint the year will end as the most successful one in its history.

During the first nine months of this year, the company saved its policyholders \$37,341.88 in premiums, this amount being retained by the policyholders, and such savings will be in excess of \$50,000.00 for the year.

For the first nine months of the year the company wrote insurance amounting to \$10,941,121.70 at a premium of \$112,025.64, which is an increase over the corresponding period of the preceding year amounting to \$1,681,886.37 at a premium of \$17,094.13. On October 1st the company had in force business amounting to \$13,919,115.70 at a premium of \$144,135.38. So far this year the fire loss has amounted to \$31,935.41. The expense of conducting business for the first nine months amounted to \$34,843.14. Business re-insured for the first nine months was at a premium of \$13,890.88. The Re-Insurance Reserve of the company was increased to \$63,632.24. The total assets on October 1st amounted to \$370,304.55, and the total liabilities, other than re-insurance reserve, amounted to \$5,823.85.

DR. F. B. POWER.

Dr. Frederick B. Power announces his retirement from his position as Director of the Chemical Research Laboratory of the Burroughs, Wellcome Company of London, Eng., and his return to this country, where his address will be 535 Warren St., Hudson, N. Y. He will be succeeded in his former position by Dr. Frank L. Pyman. Dr. Power has occupied the position he vacates for eighteen years, and during that time he has contributed many papers of great interest and benefit to the profession.

MODEL PHARMACY LAW.

The Section on Education and Legislation of the American Pharmaceutical Association is at work on a difficult and important task—that of drafting a Model Pharmacy Law. Each state pharmaceutical association and each state pharmacy examining board has been asked by the chairman of the Section to appoint one man who is particularly interested in present pharmacy laws to cooperate in this work, thus making a sub-committee of two in each state.

It will be the work of each sub-committee to go over their present pharmacy law, indicate changes which they deem necessary and make suggestions for additional provisions. These suggestions will be sent to the Chairman of the Section on Education and Legislation, and from the material thus gathered the members of the Section will make the first draft of a uniform Model Pharmacy Law.

This first rough draft will then be submitted to the members of the various sub-committees for such changes as they may deem necessary to suggest. Important differences of opinion on any one or all provisions will be submitted to the vote of the members of the various sub-committees by mail, together with arguments pro and con, and the decision of a majority is tentatively to control.

The tentative draft thus agreed upon will be submitted by the sub-committees of each respective state to its next meeting of the state pharmaceutical association, for discussion, approval or disapproval, either in whole or in part. The decision of each respective state association will then serve as a guide to their sub-committee in their final portion of the drafting.

These various sub-committees together in one body will be known as the Voluntary

Conference of the Section on Education and Legislation—each man having signified his willingness to serve and his interest in the work.

This Voluntary Conference will assemble in meeting under the auspices of the Section on Education and Legislation at the next annual meeting of the American Pharmaceutical Association where the final draft of the Model Pharmacy Law will be agreed upon.

Carrying on the work in this manner it is hoped that it will provide the best thought on the subject and the combined opinion of the best qualified pharmacists in the United States—thus making a Model Pharmacy Law which will be thoroughly representative.

RUDOLPH A. KUEVER,
The Secretary of the Section.

<>

A CORRECTION.

The motion and the remarks, on p. 1498 of the November number, in relation to the recommendation that a special committee be appointed upon the subject of standardizing pharmaceutical degrees, were erroneously attributed by the stenographer, to Mr. Henry M. Gordin. They should have been ascribed to Professor C. B. Jordan of Purdue University of Lafayette, Indiana.

PANAMA-PACIFIC EXPOSITION NOTES.

Norway broke ground for a Norwegian pavilion on the grounds of the Panama-Pacific International Exposition on October 31. Other nations have used silver and gold spades in the formal ground breaking, but Norway used two shovels of special significance, having a part in Viking romance. One is an ice shovel of the "paddle" type, made of wood from the ship *Victoria*, of the Sir John Ross Arctic expedition. The wood is held together by thongs and the blade is tipped with whalebone. Walrus tusks form a part of the handhold. The other shovel is one brought through the Golden Gate by Capt. Roald Amundsen, discoverer of the Northwest Passage and the South Pole. It was a part of the equipment of the *Gjoa*, which now rests in Golden Gate Park.

The State buildings now under construction on the grounds of the Panama-Pacific International Exposition represent a cost of \$1,200,000. The cost represented by the foreign pavilions in course of construction is \$1,000,000. These figures are exclusive of

the cost of interior fittings and furnishings, landscape gardening, installing of exhibits, and maintenance. The States most recently taking steps to construct buildings are Alabama and Nebraska. The most recent nation starting a pavilion is Switzerland.

Capt. Asher Carter Baker, U. S. Navy (retired), director of exhibits of the Panama-Pacific International Exposition, has left San Francisco for Europe, where he goes as a special commissioner of the exposition to assist European exhibitors in the final preparation of 1915 exhibits for shipment and display. No nation has changed exhibit plans because of the war.

Word has been received from Germany by officials of the Panama-Pacific International Exposition that German exhibitors are preparing exhibits for the 1915 exposition in spite of the war. With the exception of a few manufacturers near the border, there have been no withdrawals on the part of German merchants. German architects are in San Francisco at this time constructing the German sections for the nation's exhibits. Germany has established a New York office for exposition activities. One of Germany's most striking exhibits will be the Leichner Fountain, which will be shown in America for the first time. It is more than 100 feet high and appears as a great flame, yet the hand can be run through it as safely as through water.

It is announced that the Canadian Pacific Railway, which has its headquarters in Calgary, and which decided, on the breaking out of the war, to abandon an exhibit of some pretensions at the Panama-Pacific exposition, has now determined to make an exhibit along the lines originally planned.

A very large proportion of the specimens, especially the exhibits representing Alberta, have been collected. These include grains and grasses of every description that grow in the west. The north country, with its varied and wonderful animal life, will contribute its quota, while the minerals will come from British Columbia.

NECROLOGY.

James E. Cooper, aged 44 years, in Lexington, Ky., on Saturday, September 5, 1914. He became a member of the American Pharmaceutical Association in 1907.

William H. Lacey, aged 65 years, in Philadelphia, Pa., on Wednesday, September 30,

1914. He became a member of the American Pharmaceutical Association in 1907.

Gustavus Alexander Knabe, in Montgomery, Ala., on October 5, 1914. He was a life member of the American Pharmaceutical Association, joining in 1876. J. W. E.

Letters to the Editor

Mason G. Beebe, the Secretary of the Board of Pharmacy of Vermont, states that Dr. D. A. Bisbee, who sold the Wood Alcohol from the use of which, as a beverage, thirteen deaths have resulted, is not a registered pharmacist of that state and that he was not conducting a drug-store recognized as such, by the State of Vermont at the time of the sale of the poisonous liquor. Bisbee is a graduate of a medical college, but his license as a pharmacist, which he secured by registration when the Pharmacy Law was passed, had been previously revoked by the Board of Pharmacy, and at the time of the sale he was conducting a store for the sale of general merchandise, among which were a few patent medicines.

Little Rock, Ark., Nov. 24, 1914.

Editor Journal A. Ph. A., Columbus, Ohio.

I wish to congratulate you on the superb November issue of the Journal.

Every paper you admitted to the pages is a gem! I think I can see dear old chum Hynson when he read his "All Fool's Day, etc." How scientifically he punctures the conceit of some "d-d Doctors," as he meanders along! Big-hearted old fellow "his bark is worse than his bite."

But must I acknowledge it? The pictures first of all, claimed my loving attention. Just look at Remington in the front! Well is he placed. Next to his cordial smile and hand-grasp, which I had to miss at Detroit, comes the delight of looking at his masterful but still modest countenance.

Am I wrong in detecting some little "falling away" of his once luxuriant locks? It seems to me he is following the fashion set by Whelpley, my *enemy* in 1861-5, but *friend* ever since! If he was not in the Union army *bodily* he was in *Spirit*.

Then look at Army and Wulling! They both want to talk. West reminds me of Boston where I was treated so royally that I thought I was a sure enough Yankee!

I am so glad you found space for those lovely faces of some grand women! I sometimes imagine that Mrs. Godding showed me *particular* attention at the Boston meeting, but in my cooler moments I recall that she

showered smiles and kind words to every stranger she met. She was a help-mate to John G. Godding in every sense of the word. Mrs. Culley's face proves that there are good-looking women out in Salt Lake! "Howdy, Mrs. Whelpley," may you live forever.

Were I to mention the names of my dearly beloved personal friends, printed in your Journal, you would surely bar out this effusion. If you print it, however, allow me to recognize Mayo, Mason, England, Beringer, Payne, Anderson, Day, Apple, Rudiman, Wilbert, R. H. Walker, the rough diamond of Texas, Lemberger, Eberle, Diehl, Wallace of Pennsylvania, the state from which I "escaped" in 1840 when at the early age of four years!! However, I must close these reminiscences because your space is rather valuable.

John B. Bond, Sr.

FORNEY, TEXAS, Nov, 20th, 1914.

The Editor, Journal of the American Ph. Assn., Columbus, Ohio.

My Dear Sir:—On the first page of the Journal of the November issue in a biographical sketch of Prof. Joseph P. Remington, in recounting the different societies and associations of which he is an honorary member, I regret to have to be compelled to call your attention to the fact that you omitted his being an honorary life member of the Texas Pharmaceutical Association. On page 127, Proceedings of 1910, you will find "Upon motion of Secy. Eberle, Prof. Remington was unanimously elected an honorary life member of the Texas Pharmaceutical Association."

I realize that the honor Texas would do to Dr. Remington, is really an honor to Texas, rather than to the doctor. We are proud to have great men as members of our association, but when a man is both great and good we are particularly interested in his being counted as one of our number—and Dr. Remington is both great and good.

With best wishes I am,

Walter D. Adams,
President.

The Pharmacist and the Law

LICENSES—RECIPROCAL REGISTRATION—REGULATION BY BOARD OF PHARMACY.

Under Kentucky Acts 1910, c. 113, the State Board of Pharmacy is authorized to exchange certificates of registration with other states, under such rules as the board shall determine. The board adopted a rule that

applicants must have been registered in the state from which they apply at least one year before reciprocal registration is granted. In mandamus against the board to compel them to grant the petitioner a pharmacist's certificate, it appeared that his application had been denied, because he had not been registered in Georgia, the state from which he applied, for one year. He subsequently, on the elapse of the required year, made another application. Meanwhile the board had passed an additional rule, requiring that the applicant should have, for one year prior to examination, been a bona fide resident of, and been engaged in the drug business in the foreign state. As the petitioner had not been an actual resident of Georgia for one year prior to his registration in that state, his application was again denied. He claimed that the board's rules destroyed the right of reciprocal registration. The court did not concur in this. It said that, apparently, persons living in Kentucky, who were unwilling to stand the Kentucky examination, went to other states where they did not reside to get certificates, and then presented these certificates for reciprocal registration to avoid standing the Kentucky examination. But for the rule of the board, a person who had failed in the Kentucky examination might immediately go to another state, obtain a certificate, and return to Kentucky, and as a matter of right, have a certificate issued to him by the Kentucky board. The rule was held to be not arbitrary, but reasonable. The petitioner's constitutional rights had not been violated. The rule did not discriminate against the citizens of another state. It was neither harsh nor unwarranted. The petitioner was a citizen of Kentucky. The purpose of the rule was to prevent citizens of Kentucky from evading the statute of that state requiring them to pass an examination, in order to obtain a certificate as a pharmacist. Mandamus was refused.

King v. Kentucky Board of Pharmacy, Kentucky Court of Appeals, 169 S. W., 600, decided October 6, 1914.

INTOXICATING LIQUORS—SEARCHES AND SEIZURES.

In an action of trover against a sheriff and his deputies, it appeared that the plaintiff was a registered druggist and pharmacist in a village in Michigan. He had given no bond for the sale of liquor as a druggist on May

1, 1911, and did not give such bond until July of that year. On May 19, 1911, at an early hour in the morning, the defendants, holding a search and seizure warrant, made a search of the plaintiff's premises, and seized and took away liquors of the claimed value of \$284.

Michigan Pub. Acts, 1909, No. 107, Section 27, provides that if any person makes a sworn complaint or affidavit before a magistrate, that he has cause to believe, and does believe, that liquors are being manufactured, sold, furnished, or given away as a beverage, or kept for the purpose of being sold, etc., the magistrate shall issue his warrant to an officer, commanding him to search the premises designated, and, if such liquors are found, to seize them. Section 29 provides that no warrant shall be issued, until there has been filed an affidavit describing the house or place to be searched, the things to be searched for, and alleging substantially the offense in relation thereto, and that the affiant believes, and has good cause to believe, that such liquor is there concealed. In the present case, the affidavit merely alleged that the affiant believed that liquor was being sold, furnished and given away and kept for that purpose in the plaintiff's drug store, but did not allege that he believed and had good cause to believe that such liquor was there concealed. It was held that the affidavit was fatally defective, and did not give the magistrate jurisdiction to issue a warrant, and that the warrant issued was no justification to the officer for the seizure of liquor found on the plaintiff's premises.

Bullock v. Ward, Michigan Supreme Court, 148 N. W., 651, decided October 2, 1914.

<>

UNFAIR COMPETITION—"SECONDARY TRADE NAMES."

Suit in equity was brought in the Oklahoma Federal district court, to enjoin the defendants from an infringement of the plaintiff's trade name, and to prevent unfair competition. It was held that there was no evidence tending to show that the defendants had been guilty of the use of the plaintiff's trade name. The facts with regard to the allegation of unfair competition, as stated by the court, are as follows: The trade name of the plaintiff's product is "Coca-Cola." The defendants prepared and sold a beverage which is called "Koke." Both beverages are made from syrups mixed with carbonated

water. Both are put up in bottles, and are served by the glass at cold drink stands. The bottles containing "Koke" are a little taller than those containing "Coca-Cola." The bottles containing each beverage have a tin cap over the stopper. The words "Coca-Cola" and "Koke" appear in script on these tin caps. "Coca-Cola" and "Koke" are similar in color. The defendants sold to dealers exclusively. It appeared, in testimony, that, in some instances, persons who wanted Coca-Cola would say, "Give me a dope," or "Give me a Koke." There was also proof to the effect that two or three dealers in Tulsa, Okla., gave "Koke" to their customers when they had called for "Coca-Cola." There was no proof that the defendants sold "Koke" for "Coca-Cola," or advised their customers to do so. In that respect this case differs from the case of Coca-Cola Co. v. Gay-Ola Co., 200 Fed., 720. In that case, the defendant claimed to have discovered the complainant's formula, and to be in fact making the same thing. There the Court of Appeals for the Sixth Circuit held that a case of unfair competition had been made out, in that the defendant sold its product "as and for Coca-Cola." Nothing appeared in the testimony, in the present case, connecting the defendants with any effort to sell their product for Coca-Cola. There was nothing to show that they had such intention. In the case of Coats v. Merrick Thread Co., 149 U. S., 562, where unfair competition in the manufacture and sale of thread was charged, the court said: "We think the defendants have clearly disproved any intention on their part to mislead the dealers who purchase of them. Indeed, such dealers could not possibly fail to know what they were buying, and the fraud, if any, was practiced on the buyer of a single or a small number of spools, who might be induced to purchase the thread of the defendants for that of the plaintiffs. If the purchaser of such thread desires a particular make, he should either call for such, in which case the dealer, if he puts off on him a different make, would be guilty of fraud, for which the defendants would not be responsible, or should examine himself the lettering upon the spools." Although it appeared in testimony, that it was the custom of dealers, in serving the two beverages, to remove the tin caps from the bottles, so that the purchaser did not see the name thereon, that would be true as to any beverage of like or similar color to Coca-

Cola. According to the testimony of the plaintiff's agent, there are 181 beverages having practically the same color as Coca-Cola. The defendants, it was held, could not be held responsible for what their customers did without aid, suggestion, or inducement from them.

The plaintiff also argued that "Koke" had become the "secondary name" of its product, because it appeared from the proof that some persons desiring that product say to the dealer, "Give me a Koke." A trade-name may be acquired by adoption or use. But the plaintiff had never used the word "Koke" in connection with its product. It has taken and used the name of "Coca-Cola." The use of the word "Koke," as applied to the product of the plaintiff, had been, so far as the testimony showed, by persons upon their own volition without being moved thereto by the defendants. If the use of the name had been observed by the defendants, and it was afterwards adopted by them with the purpose and intention of taking advantage of that fact and to engage in the manufacture and sale of a beverage and call it "Koke," and sell it "as and for Coca-Cola," then a case of unfair competition would undoubtedly be made out.

Assuming that there is such a thing as a secondary trade-name, the right to its exclusive use must depend upon adoption and use, just as in the case of a primary name. There is such a thing as a name having acquired a secondary meaning. But it was held that the facts in this case did not call for an application of that rule. The relief sought here, was the prohibition of the use of a name that the defendants had neither adopted nor used. There was nothing to show that the defendants were using the name for the purpose of selling the beverage manufactured by them for Coca-Cola. The plaintiff's bill was therefore dismissed.

Coca-Cola Co. v. Branham, 216 Fed., 264, decided July 15, 1914.

Council Business

COUNCIL LETTER No. 6.

Philadelphia, Pa., November 12, 1914.

To the Members of the Council:—

Motion No. 10 (Election of Members; Applications Nos. 31 to 36, inclusive) has received a majority of affirmative votes.

In connection with the subject of time of holding the sixty-third annual meeting of the American Pharmaceutical Association and the suggestion that it be held either before or immediately after the time set for the annual meeting of the A. M. A., in June, 1915, Local Secretary *Pro-tem*. Schneider opposes the suggestion on the ground that the colleges of pharmacy do not close early enough to allow some of the most active members of the Association to leave for San Francisco.

Frank H. Freericks writes as follows:

"I am just in receipt of Council Letter No. 5, and note that Mr. Wilbert requests consideration for the holding of our Annual Convention some time in June, either immediately before or immediately after the meeting of the A. M. A. Of course, it would be most desirable to arrange for the respective conventions at about the same time, especially since otherwise it may interfere with the attendance at our convention of some of our most valued members. However, I cannot help but point out, that the holding of the convention at that time in June will conflict with the dates set for a great many State Association meetings, most of which take place late in June and early in July. As Chairman of the Section on Education and Legislation, I would say, also, that the Section has mapped out an elaborate plan for the drafting of "A Modern Pharmacy Law," with the support and co-operation of State Boards of Pharmacy and of State Pharmaceutical Associations. It is a feature of this plan to have the drafting of such a modern law discussed at the annual meeting of all of the State Associations, and then to have it finally agreed to and final changes made at the sessions of the Section on Education and Legislation. This will work-out well, if the convention is held during the middle or the latter part of August, but it will not be possible if the convention is held in June. Of course, you will please understand that the Section on Education and Legislation does not desire in any manner to interfere with the most suitable date for holding the convention, even if this should prevent altogether the carrying-out of its tentative program. However, I believe it but right that the Council should be made acquainted with the facts herein stated."

General Secretary Day writes:

"I have Council Letter No. 5. I presume that the matter of fixing the date for the Sixty-third annual meeting at San Francisco is now up for discussion. I would call attention to a serious disadvantage in holding our meeting in June and that is, that we would certainly conflict with the meetings of many of the state pharmaceutical associations. Nearly all of the state associations meet in June. There would not be so much conflict if we held our meeting immediately following the A. M. A. meeting, say the week beginning June 28th, but I would think that

the date suggested by the local committee, August 9th to 14th, is to be preferred.

The suggestion of the local committee to so arrange the program that the business meetings would not interfere with the entertainments conveys a subtle irony and raises the question of whether we are going to San Francisco chiefly to be entertained. As the Sage of East Aurora has remarked, "If cigarette-smoking interferes with your business cut out the business," but, seriously speaking, I believe that the entertainments are a great attraction and will be so especially at the coming meeting, but it will be difficult enough to hold our members of the sessions when there is so much to be seen at the Exposition. If the method of handling simultaneous sessions can be developed so successfully as it was at the recent Detroit meeting, perhaps it may be possible to condense our business sessions within five days or even within four so as to allow more time for the entertainments. To make entertainment the prime feature, however, I believe would be a serious mistake."

No further comments have been received and the vote will now be taken on the recommendation of the Local Committee in Council Letter No. 5, that the time of holding the sixty-third annual meeting of the American Pharmaceutical Association be set for the week of August 9th to 14th, 1915, inclusive.

Do you favor the above recommendation? It will be regarded as *Motion No. 11, (Time of Holding Sixty-third Annual Meeting of the American Pharmaceutical Association, i. e., week of August 9 to 14, inclusive).*

Local Secretary *Pro-tem*. Schneider writes as follows:

"I am enclosing a copy of a letter from the Secretary of the Canadian Pharmaceutical Association which should receive immediate attention. In order to save time I move that the American Pharmaceutical Association extend a hearty invitation to the Canadian Pharmaceutical Association to meet in San Francisco in 1915 about the same time as the time to be fixed for the meeting of the A. Ph. A."

Canadian Pharmaceutical Association,
Office of the Secretary,
Toronto, Oct. 20, 1914.

Mr. J. A. Barr,
Panama-Pacific Exposition,
San Francisco.

Dear Sir:—I have your letter of the 14th re. the 1915 convention of the Canadian Pharmaceutical Association.

The convention of the Association which was called for Winnipeg this year was postponed on account of war conditions and of course this leaves the place of meeting for 1915 wide open.

The general feeling is that Winnipeg will be the point of assembly but the matter will have to come before the Executive for decision on the 23rd of the month. I will immediately

sion and, as yet, nothing has been done. When a decision is arrived at, will communicate with you.

Yours sincerely,
G. E. GIBBARD, Secretary.

Motion No. 12 (Invitation to Canadian Pharmaceutical Association). Moved by Albert Schneider, seconded by Dr. F. E. Stewart, that the American Pharmaceutical Association extend a hearty invitation to the Canadian Pharmaceutical Association to meet in San Francisco in 1915 at about the same time as that fixed for the meeting of the American Pharmaceutical Association.

The following communication, addressed to the Secretary of the Council, has been received from Charles A. Rogers, of Morgantown, W. Va.:

"I have your esteemed favor of the 4th inst. notifying me of the favorable action of the Council regarding our petition. I, in turn, will take great pleasure in reporting the same to the pharmacists of the state. I note that the Branch is called the Morgantown, W. Va. Branch of the A. Ph. A. I might suggest that it would be advisable to have the nomenclature changed to the West Virginia Branch, etc. This would not convey the idea that it is a localized affair and would facilitate the work of getting pharmacists throughout the state interested. As soon as I am positive that my list of members is correct, I will inform you regarding the number. At the present time I feel sure that we will have twenty-five members. We will act accordingly with regard to the member of the Council. We hope to hold our initial meeting on the evening of November 19th."

Do you favor the change of title of Morgantown, W. Va. Branch, A. Ph. A., to West Virginia Branch, A. Ph. A., as requested above? This motion will be regarded as *Motion No. 13 (Change of Title of Morgantown, W. Va. Branch, A. Ph. A. to West Virginia Branch, A. Ph. A.)*

General Secretary Day writes:

"The expenses of the stenographic report for the Detroit meeting were \$379.18. We had originally appropriated in our 1914 budget, \$250.00, but there was a balance due on reporting the Nashville meeting of \$100.00, which has since been paid, also a small item for the House of Delegates of \$1.50. We now need \$230.68 to cover the expenses of the stenographic report of the last meeting. The Finance Committee has approved of this proposed addition to the budget.

Motion No. 14 (Appropriation of \$230.68 for Stenographic Services). Moved by W. B. Day, seconded by J. A. Koch, that an addi-

tional appropriation of \$230.68 be made for stenographic services for the Detroit meeting.

J. W. ENGLAND,
Secretary of the Council.

COUNCIL LETTER No. 7.

Philadelphia, Pa., November 24, 1914.

To the Members of the Council:—

Motion No. 11 (Time of Holding the Sixty-third Annual Meeting of the American Pharmaceutical Association, i. e., the week of August 9 to 14, inclusive), No. 12 (Invitation to Canadian Pharmaceutical Association), No. 13 (Change of Title of Morgantown, W. Va. Branch, A. Ph. A., to West Virginia Branch, A. Ph. A.), and No. 14 (Appropriation of \$230.68 for Stenographic Services), have each received a majority of affirmative votes.

Dr. H. M. Whelpley writes as follows:

"*Entertainment at the 1915 Meeting.* I have read with much interest the suggestion that the real work of the A. Ph. A. at the 1915 meeting be so arranged that it will not interfere with the ambition and good intentions of the local Committee of Arrangements, in charge of the entertainments. Our meeting at Detroit was one of the most enjoyable in the long series of A. Ph. A. conventions. It was also a meeting for real work. What may be termed the 'business' of the association was given first consideration, as I feel it should be every year. If we are going to San Francisco merely for entertainment, I believe it would be better to hold an A. Ph. A. meeting in some central location and then go on to the Pacific Coast for our entertainment. The A. Ph. A. meetings are generally held with a view of increasing the local interest in the association. I hope the recently formed San Francisco Branch will make a good showing. We need more members on the Pacific Coast, more papers from them for the different sections and larger delegations at the annual meetings. The San Francisco Branch has the opportunity of accomplishing much good work in this direction."

At the fourth general session of the recent annual Convention held at Detroit, the "Committee on the Recommendations of the Retiring General Secretary and Editor" (Journal A. Ph. A., Nov., 1914, 1503), recommended the following:

"Your committee in conclusion recommends that, in testimony of the unusually valuable services of the former General Secretary and Editor, James H. Beal, that an honorarium of \$1000 be presented to him with the grateful thanks of the Association, and

with the expression of the hope that many years of usefulness be vouchsafed to him."

The recommendation was referred to the Council for consideration.

Dr. Beal was not present at the meeting and it was not known whether an honorarium would be acceptable to him or not, and there was no one present to speak for him. Hence, the Council-reference.

The Secretary of the Council wrote Dr. Beal as to his wishes in the matter and the following reply has been received:

"While I am grateful to those who thought of voting me an honorarium, I feel that a precedent of this sort should not be set. If such an honorarium should be voted me by the Council, I would expect to immediately turn it over to the Endowment Fund."

The term of Thomas F. Main, of New York, as a member of the Commission on Proprietary Medicines, has expired, and he is nominated to succeed himself by C. A. Mayo, seconded by J. W. England.

Do you favor his re-election? This will be known as *Motion No. 15 (Election of Thomas F. Main as a member of the Commission on Proprietary Medicines for term expiring 1919)*.

It is the business of the Council to annually designate the member of the Commission on Proprietary Medicines who shall act as Chairman. In 1914, Dr. James H. Beal acted as Chairman. Do you favor his re-appointment? This will be known as *Motion No. 16 (Appointment of Dr. James H. Beal as Chairman of Commission on Proprietary Medicines)*.

Albert Schneider, Local Secretary *pro-tem*, writes (November 18, 1914) that:

"I have just written a letter to Dr. W. N. Nagai, President of the Pharmaceutical Society of Japan urging the Society to meet in San Francisco in 1915. I hereby move that The American Pharmaceutical Association extend a hearty invitation to the Pharmaceutical Society of Japan (Nippon Yaku-gakkwai) to meet in San Francisco in 1915 at the same time as the A. Ph. A. Dr. Nagai's address is No. 8, Shino-miyabicho, Ushigomeku, Tokyo, Japan.

The Local Committee will have a meeting write you of any recommendations and actions taken. I will lay your communications before the committee.

I may inform you that the work at the Exposition is well ahead of the schedule time. I may also state that the Exposition will prove a wonderful revelation to all visitors.

I greatly fear that the A. Ph. A. Exhibit plan will have to be abandoned. If anything

is to be done it must be done *at once*. The San Francisco Branch of the A. Ph. A. at the meeting of November 10, were in favor of the proposed exhibit but were in doubts as to the source of the funds necessary to put the proposition into execution."

Do you favor extension of invitation to Pharmaceutical Society of Japan to meet in San Francisco in 1915 at the same time as the A. Ph. A., as moved by Albert Schneider? This will be known as *Motion No. 17 (Invitation to Pharmaceutical Society of Japan)*.

Motion No. 18 (Election of Members). You are requested to vote on the following applications for membership:

No. 37. Frances Edith Hindman, University of Washington, College of Pharmacy, Seattle, Wash., rec. by C. W. Johnson and Forest J. Goodrich.

No. 38. Thomas J. Casey, 227 High Street, Morgantown, W. Va., rec. by Charles H. Rogers and J. H. Beal.

No. 39. Amos Jones, 543 E. Thompson St., Philadelphia, Pa., rec. by Quintus Hoch and George M. Beringer.

No. 40. Ernest Franklin Trolinger, 1410 Forrest Ave., Nashville, Tenn., rec. by E. A. Ruddiman and J. T. McGill.

No. 41. Mrs. Maria Gonzalez Llaena, Jesus del Monte 518, Havana, Cuba, rec. by W. B. Day and J. W. England.

No. 42. Eugene A. McLadden, Cor. Main and Mercer Sts., Hackensack, N. J., rec. by George M. Beringer and G. M. Beringer, Jr.

No. 43. Joseph J. Easley, Hastings, Pa., rec. by Charles H. Rogers and Wm. H. Moore.

No. 44. A. T. Davis, Warren, Ark., rec. by W. R. Appleton and A. L. Morgan.

No. 45. Cyrus Jacob Fuhrman, Coquille, Oregon, rec. by M. E. Everitt and J. Lee Brown.

No. 46. Charles B. Clark, P. O. Box 387, Atchison, Kansas, rec. by M. Noll and L. D. Havenhill.

No. 47. Charles C. Orr, 541 E. 112th St., Chicago, Ill., rec. by W. B. Day and E. N. Gathercoal.

No. 48. Joseph Trienens, 819 Buena Ave., Chicago, Ill., rec. by William Gray and William B. Day.

No. 49. John Smith Donnet, 1225 Hull St., Baltimore, Md., rec. by H. A. B. Dunning and O. W. Muehlhause.

No. 50. Andrew Grover DuMez, University of the Philippines, Manila, P. I., rec. by Edward Kremers and Emerson R. Miller.

No. 51. Campbell A. Neptune, 600 Market St., Parkersburg, W. Va., rec. by Charles H. Rogers and W. A. Ream.

J. W. ENGLAND,

Secretary of the Council.

415 N. Thirty-third Street.

COUNCIL LETTER No. 8

Philadelphia, Pa., December 1, 1914.

To the Members of the Council:—

Motions No. 15 (Election of Thomas F. Main as member of Commission on Proprietary Medicines for term expiring 1919), No. 16 (Appointment of Dr. James H. Beal as Chairman of Commission on Proprietary Medicines) and No. 18 (Election of Members; Applications from Nos. 37 to 51 inclusive), have each received a majority of affirmative votes.

With reference to *Motion No. 17 (Extension of Invitation to Pharmaceutical Society of Japan to meet in San Francisco in 1915 at the same time as the A. Ph. A. meeting)*, the following communication has been received from William C. Alpers:—

"The motion to invite the Pharmaceutical Association of Japan to meet with us appears to me odd and untimely. What is the cause of such a move? I cannot understand it. To receive an invitation from The American Pharmaceutical Association is certainly an honor, the highest probably that American pharmacy can extend. Why offer this honor to the Japanese with whom we have so little in common and who for various reasons are objectionable to many of us?

If we are to engage in international courtesies why not invite the nations that are related to us in blood, science and civilization? Why not invite the English, French, German, Italian pharmaceutical associations? I can find no motive whatsoever why we should invite men whose language we do not understand, whose habits and manners are different from ours and with whom many of us and our ladies would not wish to associate socially."

If any members of the Council who have voted wish to change their vote on Motion No. 17, they can do so.

J. W. ENGLAND,
Secretary of the Council.

COUNCIL LETTER No. 9.

To the Members of the Council:—

Further comments have been received upon *Motion No. 17 (Extension of Invitation to Pharmaceutical Society of Japan to meet in San Francisco in 1915 at the same time as the A. Ph. A. meeting)*, as follows:—

Frederick J. Wulling writes:—

"Concerning Motion No. 17—Invitation to Pharmaceutical Society of Japan; I would say that in matters like this we should go slowly and with deliberation. To extend an invitation implies the assumption of all responsibilities that devolve upon hosts. I do not know what would be expected of the A.

Ph. A., if it invited a foreign pharmaceutical body. No doubt we would have to live up to the customs prevailing in the country to whose association we issue the invitation. On the whole, I feel that we give too little consideration to most of our transactions. A matter of such significance as an invitation to a foreign body to meet with us should have the fullest kind of thought by a competent committee and such a committee should have sufficient time to enable it to make its report and possibly recommendations authoritative. While I would be more than delighted to greet our Japanese colleagues within our own territory, I yet would urge that we think the matter of an invitation over very carefully.

Of course it should be noted that the letter written by Dr. Schneider to the President of the Pharmaceutical Society of Japan was an individual letter not binding upon the A. Ph. A. in any wise. I feel very strongly that we should not vote upon Motion 17 without further consideration."

Dr. Francis E. Stewart writes:—

"Regarding the motion to invite the Pharmaceutical Society of Japan to the meeting in San Francisco in 1915 at the same time as the A. Ph. A. meeting, I voted in the affirmative, but since the matter is still open for consideration, I wish to reconsider and vote against it.

My reasons for so doing are not the same as those of Mr. William C. Alpers, for I have no objection whatever to cultivating international friendship and good will between all of the nations of Europe, whether related to us in blood, science or civilization or not; but it would seem to me that an invitation of the kind at the present time would be a breach in the neutrality which the United States is maintaining toward the warring factions in various parts of the world, unless we include in our invitation on equal terms the pharmaceutical associations of all of the nations now at war."

George H. Schafer writes:—

"Propinquity of Japan and time was probably the cause for Mr. Schneider's motion No. 17. As I may have erred in voting yes on such motion, I would favor its reconsideration and amendment to meet the well-taken objections of William C. Alpers. If in order, will move its reconsideration or will second such motion if made by others."

No motion for a reconsideration of Motion No. 17 is necessary at this time, as no vote on the motion has been announced. The subject is still before the Council for consideration and members may change their votes, or table the motion, or substitute it by another motion. Members are asked to express their opinions on the subject.

J. W. ENGLAND,
Secretary of the Council.

Journal of the American Pharmaceutical Assoc., 2, 1914.

Restricted Book

The borrowing of this book is subject to the restriction as checked below.

1. May be used only in the library, not to be withdrawn at any time.
2. May only be withdrawn from 4 P.M. until 9 A.M. of the following day.
3. May be borrowed for a period of 24 hours.
4. May be borrowed for a period of 7 days.
